### Strategic Parliamentary Dissolution

n important agenda power in parliamentary democracies is the discretion over the dissolution of parliament. We argue that variation in constitutional rules and the political environment will systematically affect the frequency of early elections. We hypothesize that dissolution will be more frequent under single-party governments, when the head of state plays an insignificant role, when neither parliament nor the cabinet can inhibit dissolution, when minority governments are in power, when the head of state can dissolve unilaterally, and later in the constitutional term. Using standard logistic and Cox-proportional hazard techniques, we test these expectations in a pooled time-series setting against observations of most OECD parliamentary democracies for the years 1960–1995. We find that parliamentary dissolutions are more frequent earlier in the constitutional term, under minority governments, when the head of state plays an insignificant role, and when the parliament or the cabinet is not involved.

n parliamentary democracies, the accountability of representatives to citizens is established and maintained primarily through legislative elections. Political scientists have paid great attention to such contests and to the popular preferences they signal. A central theme in this vast literature is whether or not (and how) governments are rewarded or punished for their performance—most commonly, their economic performance—while in office (e.g., Anderson 1995a, 1995b; Powell and Whitten 1993; Rose and Mackie 1983). What has been less widely studied, however, is how incumbent politicians use their constitutional dissolution powers precisely to choose the time and circumstances of the voters' reckoning.

Early elections are an option in almost every parliamentary system. Yet the conditions under which this option can be and is exercised vary significantly. Parliamentary dissolution sometimes occurs at the call of a single actor such as the prime minister, whereas in other cases it results from the interaction of several public officials including presidents and parliamentarians. Thus, the politicians whose careers and political fortunes are most directly at stake can frequently manipulate the timing of elections and the conditions under which they occur. Voters and opposition politicians are not blind to this. As a result, the electoral accountability of parliamentary governments is bound up in a series of strategic and anticipatory relationships.

We seek to explain early parliamentary dissolution. There are two potential explanations. Either dissolution occurs because of political need or it happens due

to political opportunity. In the former case, dissolution could happen with particular frequency during times of crises or in unstable countries. In the latter case, early elections should be held when politicians find them opportune for partisan or personal reasons. We entertain the second possibility. We argue that opportunity is profoundly affected by institutional differences in the strategic environment in which dissolution decisions are made. While it is important to understand the motivations of the politicians empowered to make dissolution decisions, it is just as important to grasp how their opportunities and incentives vary across institutional settings. In exploring these institutional effects, we build on the veto players framework that has become influential in the study of comparative politics (e.g., Tsebelis 2002). Yet a precise understanding of the mechanisms of parliamentary dissolution requires a refinement of that conceptual apparatus.

### **DISSOLUTION POWERS: A SURVEY**

We take parliamentary government to mean the institutional arrangement in which the chief executive is accountable, through a confidence relationship, to the parliamentary majority and can be removed from office by the latter (Strøm 2000). In most such regimes, simple legislative majorities can dismiss the executive at will on a motion initiated either by the opposition (a successful no confidence motion) or by the prime minister (a failed confidence motion) (Huber 1996). Most parliamentary democracies also feature a potentially offsetting dissolution power that permits parliament to be retired and new elections to be held before the regular legislative term is up.<sup>1</sup>

This dissolution power is often viewed as a key feature of parliamentarism. Douglas Verney (1959), for example, counts it among the 11 defining characteristics of parliamentary democracy. To Juan Linz (1994), it is a

<sup>&</sup>lt;sup>1</sup> We refer to parliamentary dissolutions and early elections synonymously. Thus, we assume that whenever parliament is dissolved, a general election is constitutionally required and indeed takes place. We thus ignore potential dissolutions followed by states of emergency, coups d'etat, and the like.

critical antidote to the problems of "temporal rigidity" that plague presidential democracies. Parliamentary government is commonly conceived as a system of "fused powers," in which the legislative and executive branches of government are forced to represent consistent policies. When vested in the head of government, the authority to dissolve parliament is a counterweight to the legislative majority's dismissal power. These two "doomsday devices," the dismissal power and the dissolution power, force the legislative and executive branches of government into interdependence (Lupia and Strøm 1995).

Contemporary parliamentary constitutions vary widely in their dissolution powers. There are some systems in which discretionary dissolution is constitutionally proscribed. In Switzerland, which we admittedly would not classify as a parliamentary democracy, parliament can be dissolved only upon constitutional amendment. And while the Norwegian constitution in practice is clearly parliamentary, it permits no early dissolution of the Storting (the Norwegian Parliament) for any reason. Yet such cases are rare. Most constitutions permit parliamentary dissolution and place the ultimate decision in the hands of the head of state, whether monarch or president. In some cases, France and Italy among them, the head of state is constitutionally free to dissolve parliament at his or her discretion. More commonly, however, the head of state can dissolve parliament only upon the request of the prime minister. Yet under some constitutions the prime minister may be able to dissolve unilaterally (as in New Zealand) or with the consent of the parliamentary majority (as in Belgium since 1995). Elsewhere, parliament may, by majority vote, decide to dissolve itself (Austria and, by implication, Sweden since 1975). Several regimes permit or mandate dissolution upon the passage of a constitutional amendment (e.g., Denmark and Belgium). Finally, constitutions sometimes constrain the circumstances or timing of parliamentary dissolution. Many constitutions (e.g., the German Basic Law) seek to reserve this mechanism for emergency situations. The French Constitution does not allow the president to dissolve within the first year of the parliamentary term. And the Italian Constitution permits no dissolution in the last six months of the president's term (the so-called "white semester").

Table 1 surveys the dissolution powers of 20 advanced industrial democracies. We can distinguish among 10 forms of dissolution power, which are not all mutually exclusive. Overall, the variety of dissolution provisions displayed in Table 1 is remarkable. Except for some states in the Westminster tradition, hardly any two parliamentary systems are alike. Some constitutions (e.g., Belgium and Denmark) feature a combination of several dissolution powers. But is this diversity of institutional mechanism purely a curiosity, or does it have systematic and predictable consequences for the ways in which these powers are employed? We argue that differences in dissolution powers indeed affect the incidence of early elections. Our next task is to review our understanding of the behavior that results in parliamentary dissolution, which will enable us to identify the institutional conditions that lead to its occurrence.

### EXPLAINING PARLIAMENTARY DISSOLUTION

Although the literature on parliamentary dissolution is by no means large, recent years have witnessed several interesting efforts to understand the phenomenon and its implications. For example, empirical analyses suggest that Japanese governments may be more likely than Indian ones to dissolve strategically (Chowdhury 1993; Ito 1990). But even more important have been a number of theoretical efforts to understand parliamentary dissolution more generally in "opportunistic" terms. Fundamentally, this body of scholarship has been based on Smith's (2000, 5) simple but powerful observation that leaders "call elections when they expect to win." In its most parsimonious form, this assumption has provided the motivation for models that depict parliamentary dissolution as a decision problem faced by a rational and unitary government interested in exploiting its power for electoral advantage. In his pioneering analysis, Balke (1990) thus models the government's decision to call early elections as an optimal stopping problem, assuming that governments maximize tenure in office in a zero-sum world. He finds, among other results, that parliamentary dissolution should be more common when governments enjoy high popularity and when the end of the parliament's regular term (the time at which the constitution mandates that elections be held) approaches.

While the decision whether or not to dissolve may be in the hands of the government incumbents, their behavior may well be conditioned by their interaction with other political actors, such as opposition parties or the voters themselves. To the extent that such actors can affect the benefit that incumbents derive from dissolution, they transform dissolution decisions into games of strategic interaction. Smith (1996) thus analyzes the decision to call early elections in majoritarian systems as a sequential equilibrium game between voters and party (government and opposition) leaders. He assumes that voters use their information about dissolution decisions to update their beliefs about the government's competence and that the opposition devotes resources to a campaign aimed at affecting these perceptions. Ultimately, guided by their perception of the government's competence relative to the opposition, the voters choose whether or not to reelect the government. Given these assumptions, Smith reports, among other analytical results, that early elections are called when the government is popular and when the current value of holding office is low compared to the expected value of future office—holding. The latter might, for example, be the case under a minority government (Smith 1996, 103-04).

Neither Balke nor Smith models governments consisting of a coalition of parties with diverging preferences, the situation that typifies most parliamentary democracies. Lupia and Strøm (1995), however,

analyze the strategic timing of parliamentary elections in such coalition systems. Their game begins when an event (e.g., a credible poll) informs all parties about their expected fortunes if an election were to be held. Each coalition member can then offer a reallocation of power to any other party. If no party is willing to make an acceptable offer, either there is a vote of confidence in the existing coalition or parliament is dissolved. Lupia and Strøm find that dissolution is most likely when there exist parties that expect large net benefits from an election and at the same time derive little value from the seats they currently control or from coalitions they could enter. Their model also suggests that, all else equal, dissolution becomes more attractive as the end of parliament's constitutional interelection period (CIEP) approaches. Finally, Lupia and Strøm (1995, 655–56) find that dissolution depends on the balance between several types of costs: the opportunity costs of calling elections and the transaction costs of bargaining, campaigning, and electioneering. Diermeier and Stevenson (2000) provide a stochastic reformulation of this model, and in their empirical estimates they separate out the hazard rate due to parliamentary dissolution. Consistently with Lupia and Strøm, they find a substantial increase in the dissolution hazard as the end of the parliamentary term approaches, though empirically this increase is not monotonic.

While this emerging literature rigorously models the motivations behind dissolution decisions, it does not fully capture the effects of the institutional environment. Both Balke and Smith, for example, assume unitary governments that can dissolve parliament at will. This is a considerable simplification of parliamentary democracies, most of which have multiparty cabinets and constitutions that constrain the prime minister's ability to dissolve. Similarly, Lupia and Strøm model dissolution only as a last stage in coalition bargaining and assume that dissolution occurs only when a majority of the legislators prefer that outcome to the status quo. In the real world, however, there is often no coalition bargaining before parliament is dissolved,2 particularly if dissolution powers are vested in a single constitutional agent such as the president.3 For example, when President François Mitterrand dissolved the French National Assembly in 1981, he deliberately did so against the preferences of the center-right parliamentary majority.

Thus, the existing literature has not adequately captured the institutional rules under which parliamentary dissolution typically happens. Nor has it fully explored

the effects of bargaining between players representing different political parties. Finally, the existing literature remains theoretical and so far has not spawned any extensive empirical investigation. We move forward in all these respects, by considering more complex and plausible institutional environments, by explicitly modeling multiparty situations, and by subjecting our theoretical results to systematic empirical tests. We do so somewhat inductively, by constructing our models on the basis of the empirical survey of dissolution powers reported above.

### STRATEGIC DISSOLUTION: A MODEL

Building on Table 1, let us now consider the circumstances in which parliamentary dissolution powers will be exercised. Presumably, constitution-makers devise dissolution powers to allow politicians to extricate themselves from decisional gridlock, to allow disgraced leaders to retreat, or to permit a consultation with the voters on pressing and unforeseen issues that may arise. Hence, parliamentary dissolution powers are designed to avoid the "temporal rigidity" that Linz (1994) finds to be such a flaw in presidential systems. Yet, like all institutions, dissolution powers can be manipulated for other, and perhaps less lofty, purposes. We are concerned with the ability of politicians to use them for partisan purposes, though we do not deny the possibility of more public-spirited use. Thus, in this section we develop a baseline model of strategic parliamentary dissolution, which we later extend. We model the process that may lead to new elections as a game between three players: (1) the prime minister, whom we assume to be the leader of one of the governing parties, (2) a pivotal coalition partner, and (3) the head of state. We make no assumption here as to whether the head of state holds an elective or hereditary office or whether or not that person is a partisan. We do, however, return to these issues.

Our model assumes that all players are rational and that all the features of the game are common knowledge. We exclude from consideration all dissolutions that are caused by the government's own defeat or collapse. Moreover, we focus on those circumstances in which the options of renegotiating an existing coalition or forming a new one, rather than calling elections, can be disregarded. The game takes place during the parliament's term, after it has been elected and before its maximum constitutional term (the end of the CIEP) has been reached. The events we describe may be set in motion by a change in one of the relevant payoffs, for example, the expected benefit to one of the parties of holding an election at that time.

We assume that each player has a specific constitutional power and that their interaction occurs in a specified sequence. We agree with Tsebelis (1995, 2002)

<sup>&</sup>lt;sup>2</sup> The best interpretation of such cases, however, may be that the relevant party leaders bypass the bargaining stage because they correctly anticipate its costs (see above) relative to the expected benefits. In other words, if party leaders perceive a substantial probability of winning an outright majority, they may be unlikely to accept the transaction costs of coalition bargaining and the hassles of actually implementing such a deal. This is particularly likely to happen in majoritarian systems, such as the ones analyzed by Smith.

<sup>&</sup>lt;sup>3</sup> Nonetheless, the stipulation makes sense as an equilibrium institution, since we would not expect parliamentary majorities to sustain rules under which the legislature could routinely be dismissed against the preferences of its majority.

<sup>&</sup>lt;sup>4</sup> In Lupia and Strøm's (1995) terms, this could be because the transaction costs of coalition bargaining are too high relative to the benefits. Compared to Lupia and Strøm, we thus simplify our assumptions about the bargaining environment, while our model is more institutionally contextual.

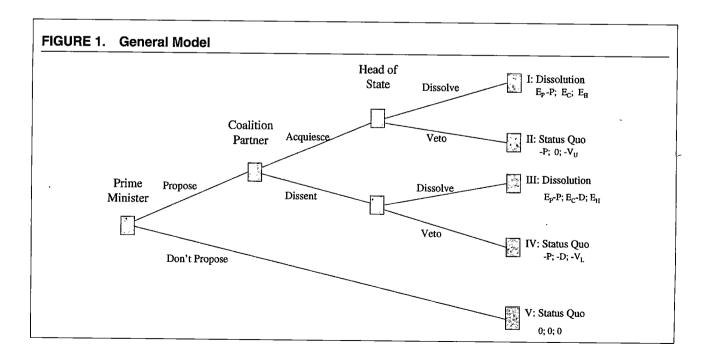

that the number and preferences of veto players matter. Yet an adequate understanding of parliamentary dissolution requires a careful specification of the decision process and the powers of the individual players. It is useful and indeed necessary to distinguish between powerful players, whose actions may affect the payoffs of other players but whose consent is neither sufficient nor necessary for dissolution; veto players, whose consent is necessary but not sufficient for dissolution; decisive players, whose consent is sufficient but not necessary; and, finally, dictators, whose consent is both necessary and sufficient (Strøm 1995). Moreover, among veto players there may be important differences between those that can exercise agenda control, ex ante veto players, and those that can instead put their feet down ex post.

In our baseline model, the prime minister is a veto player with agenda control. He, and only he, has the power to propose dissolution, and unless he does so, no election will be held until constitutionally required. The coalition partner is a powerful player who has consultative power only. She can dissent from the prime minister's request. After the prime minister has requested dissolution, the coalition partner can choose either to oppose that request or to acquiesce. Finally, the head of state has ex post veto power. Once the prime minister has requested dissolution, and regardless of whether the coalition partner dissents, the head of state can either grant or refuse this request. This baseline model assumes that parliamentary dissolution can take place only when it is initially requested by the prime minister and then approved by the head of state. We later show the implications of varying these institutional assumptions. The extensive form of the game is illustrated in Figure 1. Note that while all three players have some capacity to influence the outcome of the game, they are not all veto players. While the head of state holds an ex post and the prime minister an ex ante veto, the

coalition partner is at best a powerful player, who cannot by herself prevent dissolution.

There are five possible outcomes, identified by Roman numerals in Figure 1. Either the prime minister proposes dissolution or he does not. In the latter case, no election is held and the game ends (outcome V). If, on the other hand, the prime minister does call for new elections, the coalition partner has the choice whether or not to oppose this request. If she acquiesces, the game proceeds to the upper subgame at the final decision node, whereas if the coalition partner instead opposes the prime minister's call, the game advances to the lower subgame. Finally, the head of state decides whether to heed or reject the prime minister's request. If the head of state dissolves, the game ends at outcome I (if the coalition partner has acquiesced) or at outcome III (if she has dissented). If, on the other hand. the head of state refuses to dissolve, the result is either outcome II (if the coalition partner has acquiesced) or outcome IV (if she has opposed dissolution).

Before we can solve this game, we describe the payoffs of the players. For each player, there is an expected net value of holding the election now, which we denote  $E_{\rm P}$  for the prime minister,  $E_{\rm C}$  for the coalition partner, and E<sub>H</sub> for the head of state. Think of this variable as the difference between the value of holding elections now and the value of continuing the existing parliament, either until its term expires or until some other opportunity for dissolution may arise. We make no assumption as to precisely why the players may or may not prefer a new election. For example, the prime minister may prefer to dissolve because he expects that an early election will allow him to remain prime minister for a longer time, because he believes that his party will get more votes now than at any feasible time in the future, because he anticipates that he may be able to form a more valuable coalition now than later, or for some combination of such reasons.

We do assume, however, that to the prime minister and the coalition partner the value of the existing parliament will decline over the course of the parliamentary term. This value derives from two factors: the values of the existing seats and bargaining power that the party enjoys and the value of future opportunities to time elections. With each passing day, the time left in the existing parliament diminishes, and so do the opportunities to call early elections. On the very last day of the parliamentary term, existing seats must be relinquished, and the opportunity to decide election timing disappears. Hence, all else equal, as the value of the existing parliament declines over the course of its term, the net value of holding new elections rises.

### Costs

Each player faces a specific cost associated with the exercise of his or her respective powers. The prime minister incurs a proposal cost, P, where P > 0, whenever he requests an early election. We can think of this as a shorthand for the (unmodeled) signaling game between the prime minister and the voters. As Smith (1996) argues, the prime minister has private information, unavailable to the voters, about the likely future performance of the government and the economy. He can use this information strategically to call elections when he anticipates downturns in the government's fortunes. Unfortunately for him, this very act functions as a signal to the voters that worse times lie ahead. Whenever the prime minister requests dissolution, he thus signals to the voters a lack of confidence in the government's future. The voters will use this information to downgrade their assessment of the government's performance and may respond by withdrawing support from the prime minister's party. We therefore assume that there is always some nonzero cost to such proposals.

The coalition partner pays a dissent cost, D, where D > 0, if she opposes the prime minister's request. Any such expression of dissent amounts to overt conflict within the governing coalition. Awkwardly, this conflict may have to be resolved at the same time that the parties are going into an electoral campaign. The cost of such behavior, again, derives from the voters. All else equal, we believe that voters will downgrade their assessment of governing parties whenever these parties openly squabble. Such squabbles, of course, are likely to be particularly costly when they occur just prior to a general election.

Finally, the head of state pays a veto cost, V, where V > 0, if he vetoes a prime ministerial request for early dissolution. Refusing such a request means picking a fight with the prime minister. Although among parliamentary democracies the head of state's constitutional powers vary, he is typically less powerful than the prime minister. We therefore assume that, all else equal, the head of state will prefer not to frustrate the prime minister. Note, however, that the head of state's veto cost is contingent on the behavior of the coalition partner. If the coalition partner has opposed dissolution and we are in the lower subgame in Figure 1, then the veto cost

is lower than in the upper subgame. In other words, it is less costly for the head of state to refuse a contested request for dissolution than an uncontested one. We denote the former (contested) veto cost  $V_L$  (denoting the lower subgame) and the latter (uncontested) veto cost  $V_U$  (denoting the upper subgame).

For simplicity, we assume that no player is indifferent between any of the potential outcomes. Given these assumptions, Table 2 illustrates the payoff to each player under each of the five possible outcomes. Again, all features of the game are assumed to be common knowledge.

We solve the game through backward induction. As the simple proof in the Appendix shows, three of the five outcomes (numbers II, III, and IV) never occur in equilibrium. The coalition partner will never oppose the prime minister's request if she knows that the head of state will dissolve regardless (outcome III). And the prime minister will not propose if he knows that the head of state will veto (outcome II or IV). In equilibrium, we should therefore never observe dissolution requests that are opposed by the prime minister's coalition partner or vetoes by the head of state. This result serves as a caution against interpretations to the effect that even strong heads of state are powerless to refuse dissolution or that parties that do not control the prime ministership cannot prevent the PM from dissolving. One cannot infer the impossibility of such events from their nonoccurrence. Rather, vetoes and intracabinet conflict over dissolution requests fail to occur because the prime minister, or the head of state, anticipates the costs they would impose. The empirical evidence suggests that such "out-of-equilibrium" behavior is, in fact, quite uncommon.<sup>5</sup> The paucity of contested dissolutions thus suggests that complete

Irish Taoiseach (Prime Minister) Albert Reynolds was less fortunate. In 1993-94 he led a coalition of his own Fianna Fáil and the

<sup>&</sup>lt;sup>5</sup> Occasionally, presidents apparently do consider vetoing dissolution requests, as when German Chancellor Helmut Kohl in 1983 engineered the parliamentary defeat of his coalition on a confidence vote and subsequently requested that Federal President Karl Carstens dissolve. At the time, there was some question as to whether Carstens would indeed comply. Kohl's request was a fairly blatant manipulation of the German Basic Law, according to which the chancellor can request dissolution only when his government has lost its Bundestag majority. Clearly, his parliamentary defeat notwithstanding, Kohl continued to enjoy the confidence of a parliamentary majority. In the end, President Carstens nevertheless acceded to Kohl's request. Yet, over the nearly two decades that have since passed, no other Bundestag has been retired early.

information is a realistic assumption for most dissolution scenarios.

Parliamentary dissolution will thus occur if and only if either  $E_{\rm P}-P>0$  and  $E_{\rm H}>-V_{\rm L}$  (regardless of the coalition partner's incentive condition) or  $E_{\rm P}-P>0$  and  $E_{\rm C}>-D$  and  $-V_{\rm L}>E_{\rm H}>-V_{\rm U}$ . Under all other conditions, the prime minister will not propose and no dissolution will occur.

Given the conditions for dissolution summarized above, simple comparative statics can generate further inferences as to the likelihood of dissolution. For example, all else equal, an increase in the prime minister's, the head of state's, or the coalition partner's expected benefit from an early election could cause parliament to be dissolved when otherwise the status quo would have prevailed. And such increases could never have the opposite effect. Similarly, dissolution may be precipitated by a decrease in the prime minister's proposal costs, or by an increase in the coalition partner's dissent costs or the head of state's veto costs, but never by shifts in the opposite directions.

Irish Labour Party. The coalition collapsed in fall 1994, when Labour withdrew and announced that it would support a no-confidence motion against the rump Fianna Fáil government. Reportedly, Reynolds considered requesting a dissolution of the Dáil (the Irish House of Commons). However, President Mary Robinson then consulted the Chair of the Bar Council on her constitutional powers, which was interpreted as a signal that, if asked, she would veto dissolution (she later told a journalist that she would indeed have refused to dissolve). Thereupon, Reynolds simply capitulated and resigned as Taoisech and party leader. Instead Ireland had its first-ever change of governing parties without an election. Thus, although dissolution was contested in the Irish as well as the German case, neither president ended up casting a veto.

#### **SPECIAL MODELS**

The model that we have presented does not capture all the real-world institutional variation and complexities. As Table 1 shows, dissolution powers come in many varieties. In addition, they may be exercised in circumstances that do not fully meet the specifications of the model, for example, under single-party governments. Fortunately, a number of these conditions can be captured through simple modifications of our baseline model. In this section, we develop four "special" versions, each of which reflects a common empirical regularity that deviates from the specifications of the baseline model. As we shall see, each special model also generates somewhat different conditions under which parliamentary dissolution will be proposed and undertaken.

### **Special Model 1: No Coalition Partner**

One special circumstance is when the prime minister has no coalition partner, for example, because he leads a single-party majority government. Then, there will never be a member of the cabinet with a partisan incentive to oppose the request for dissolution. Since the possibility of a contested dissolution proposal is moot, the head of state always finds himself in the upper subgame, and the necessary and sufficient conditions for dissolution reduce to  $E_{\rm P}-P>0$  and  $E_{\rm H}>-V_{\rm U}$ . See Figure 2 for an illustration. In other words, the existence of a suitably motivated coalition partner can, in some circumstances, prevent early parliamentary elections but can never by itself cause dissolution when this would

not otherwise occur. Parliamentary dissolution thus occurs more easily when there is no coalition partner.

### Special Model 2: Proposal Power Vested in the Cabinet/Parliamentary Majority

The second special model is one in which the coalition partner's approval is necessary for dissolution. Thus, in this model the coalition partner is a veto player, as illustrated in the lower half of Figure 2. We can think of this case as equivalent to a constitution under which the decision to dissolve must be taken by the cabinet as a whole (or by a parliamentary majority).6 Austria, Israel, and Sweden feature this variety of dissolution power, though in none of these countries is this the only circumstance in which early elections can be called. Under special model 2, parliamentary dissolution will occur if and only if  $E_C > -D$  and  $E_P - P > 0$ and  $E_{\rm H} > -V_{\rm U}$ , that is, when indeed the incentive conditions of all three players are satisfied. Thus, this is the only one of the special models in which the necessary and sufficient conditions for dissolution are unambiguously more restrictive than in the baseline model. Hence, if agenda control over dissolution rests with the parliamentary majority, rather than with the prime minister, early elections should be less common.

### Special Model 3: A Nonpartisan or Powerless Head of State

We noted above that in our baseline model the head of state is a generic player. In reality he or she may be either a monarch or a directly or indirectly elected president. As students of parliamentary democracies well know, many such polities, such as the United Kingdom, Spain, Belgium, The Netherlands, and several of the Scandinavian countries, have hereditary monarchs whose preferences (at least those that are publicly expressed) are not driven by electoral considerations. Even under republican constitutions, the president may, for all practical intents and purposes, be a nonpartisan figure, as in Iceland. Nonpartisan heads of state tend to take pains to appear personally disinterested in electoral outcomes.

The constitutional status of the head of state clearly has implications for our model. If the head of state is partisan, then the expected value he derives from early elections will vary with poll numbers and the electoral cycle in the same way as those of party leaders. If, on the other hand, the head of state is nonpartisan, then his net value from new elections should be zero. Our third special model is thus one in which the head of state either

is a figurehead or is always indifferent between existing and future parliaments. In this case, we can think of the head of state's incentive condition as satisfied, which means that he will always dissolve if asked. Hence, the coalition partner will not dissent, and dissolution will take place whenever the prime minister's incentive condition is satisfied (i.e., if and only if  $E_P - P > 0$ ). It is easy to see that this is a more inclusive set of conditions than those that cause dissolution in our baseline model. In other words, to the extent that the head of state's type affects whether or not early parliamentary elections are proposed and held, dissolution occurs more easily under nonpartisan heads of state than under partisan ones. The same logic applies a fortiori to constitutions in which the head of state does not even have any authority to veto dissolution proposals, as in Japan, New Zealand, and Sweden. Here, too, dissolution will occur whenever the proposer's incentive conditions are met.

### Special Model 4: The Head of State Can Dissolve Unilaterally

Finally, our empirical survey tells us that proposal power over parliamentary dissolution need not rest with the prime minister. In several countries, the head of state (empirically in such cases, this is always a president) can dissolve parliament unilaterally. This is true in France, Iceland, and Italy. Until 1991, it was the situation in Finland also. In the fourth and final special model, the head of state is thus constitutionally permitted to dissolve parliament on his own. Since agenda control then rests with the head of state himself, there are no veto costs, and the head of state is effectively a dictator rather than a veto player. The necessary and sufficient conditions for dissolution hence reduce to  $E_{\rm H} > 0$ . In other words, when the head of state can dismiss parliament unilaterally, dissolution depends strictly on whether his own incentive condition is satisfied.8

Note that, compared to the baseline model, this is not unequivocally a more or less restrictive set of conditions. Rather, it substitutes a simple incentive condition for the two conditions in the baseline model. In other words, if the president's incentive condition is satisfied, the prime minister's incentive condition does not bind. On the other hand, unless the head of state favors it, there is no set of preferences on the part of the prime minister and coalition partner that will generate parliamentary dissolution. In the baseline model, the president may dissolve even if his net electoral benefit is negative, as long as his veto costs outweigh this disutility. This will not occur in Special Model 4. On the other hand, in the latter model, the president may have an opportunity to dissolve in situations in which in the baseline model the prime minister would preempt such behavior.

<sup>&</sup>lt;sup>6</sup> We treat these two conditions as equivalent. Under minority government, of course, the cabinet may not command the support of a parliamentary majority. In our empirical analysis, we estimate the effect of minority status independently, so that we can control for this divergence.

<sup>&</sup>lt;sup>7</sup> Note also that under this form of dissolution power, the head of state typically either is nonpartisan or does not enjoy veto powers. Thus, several real-world countries combine special models 2 and 3. In our empirical model we estimate the effects of these two institutional variations independently, so that it is possible to account for their simultaneous or separate occurrence.

<sup>&</sup>lt;sup>8</sup> The head of state is then either a decisive player (if there are other ways beyond his control in which parliament can be dissolved, e.g., through a constitutional amendment) or a dictator (if there are no such alternative roads to dissolution). In this analysis, we generally disregard the former possibility.

In Table 3, we summarize the results of the baseline model, as well as each of the special models. All the necessary and sufficient conditions for dissolution can thus be characterized by these 16 mutually exhaustive and exclusive payoff configurations. Note that in the baseline model, five configurations lead to early elections (outcome I), whereas in the remaining 11, no proposal to dissolve will be made (outcome V). In Table 3, we have also identified for each cell the special models in which the result would differ from that of the baseline model.

In the top left-hand cell in Table 3, all three players derive a net benefit from dissolution. Not surprisingly, dissolution occurs under each of our five institutional models. In the cells toward the lower right-hand side, dissolution is much less attractive to the players, and correspondingly there are six cells in which dissolution never happens in any model. The most interesting cells, however, are the shaded set of nine cells running from the top right-hand corner to the bottom left-hand one. These are the conditions under which the preferences of the different constitutional players diverge, and institutional features determine whether or not dissolution happens. In five of these cases, dissolution occurs in one or several special models but not in the baseline model. In four cases, the status quo prevails in one or more special models, whereas the baseline model predicts dissolution. In sum, these results show that (1) there is a broader set of preference configurations associated with the status quo than with dissolution, and (2) there is a large set of conditions under which specific institutional features, rather than preferences in and of themselves, determine the outcome. The first of these results reflects the fact that, overall, dissolution powers tend to constrain, rather than enable, individual constitutional players. The second result suggests that such institutions are both diverse and consequential.

### **HYPOTHESES**

These results lead straightforwardly to a number of testable hypotheses. As we have seen, the incidence of parliamentary dissolution is determined in part by the preferences of the players and in part by the institutions that may or may not empower them to dissolve. Unfortunately, the preferences of the players, and specifically their electoral expectations, are not directly observable, whereas the institutions are. Many of our hypotheses are therefore derived from the special models and the institutional variation that they reflect. The specific hypotheses that will guide our analysis are summarized below. All should be read as *ceteris paribus* expectations.

Hypotheses 1 through 4 concern institutional effects that follow directly from the special models.

Hypothesis 1. Except when the head of state has unilateral dissolution power, parliamentary dissolution will be more common under single-party than under coalition governments.

Hypothesis 2. Compared to that in the baseline model, dissolution will be less common when proposal power is vested in the cabinet or in the parliamentary majority.

Hypothesis 3. Compared to that in the baseline model, dissolution will be more common when the head of state is either powerless or nonpartisan.

Hypothesis 4. When the head of state has unilateral dissolution power, the incidence of dissolution will differ from that in the baseline model.

Hypothesis 1 follows from Special Model 1, with the caveat that we expect no effect of coalition status when the dissolution decision rests with the head of state alone. Hypothesis 2 follows straightforwardly from Special Model 2, and Hypothesis 3 similarly from Special Model 3. Hypothesis 4 is the only one that may require a bit of elaboration. Recall from Special Model 4 that when the head of state can dissolve unilaterally, we have countervailing expectations. On the one hand, the president can dissolve even in situations in which the prime minister would not have requested it. On the other hand, an agenda-setting prime minister might request dissolution in situations where the head of state would not have dissolved on his own initiative

but is unwilling to pay the veto cost. A priori, we have no reason to expect one condition to be more prevalent than the other. This is therefore the only hypothesis that does not specify the direction in which we expect the outcome to differ from the baseline model.

Our next four hypotheses focus on the net electoral benefits, and thus the preferences, of the relevant players. These hypotheses follow less directly from our models but are supported in part by other scholarship on dissolution. Recall that net electoral benefits are the expected benefits from an early election, minus the continuation value of the existing parliament. The latter may differ systematically depending on the type of government in office. Some governments are less capable of controlling the legislative agenda than others and, therefore, less likely to generate effective public policy. Such governments may also more easily be induced to dissolve parliament. The less effective and secure the government is under the existing distribution of parliamentary forces, the lower the value of continuing the existing parliament. Specifically, we expect minority governments to be more frequently persuaded or compelled to call early elections. As Balke (1990, 211-12) points out, "The fact that the government might be forced from power sometime in the future lowers the opportunity costs of losing the election. Thus, governments in parliamentary systems that allow the dissolution of Parliament by a vote of no confidence or systems where coalitions are relatively unstable will call early elections more often" (Smith [1996] makes a very similar argument).

There are actually two reasons to expect minority governments to call early elections more frequently than other administrations: their vulnerability and their electoral prospects. A minority government may easily find itself in a situation in which it has much to gain and little to lose from elections. It might, in such circumstances, dissolve in the hope of significantly improving its bargaining power, for example, by gaining a parliamentary majority, as British Prime Minister Harold Wilson did in October 1974. Both of these factors enhance the expected benefits from an election, relative to current benefits. Since under minority governments the continuation value of the current parliament is thus likely to be low, the net value of new elections should be correspondingly higher.

Hypothesis 5. Early dissolution will be more common under minority governments than under majority governments (Balke 1990; Lupia and Strøm 1995; Smith 1996).

An additional consideration is the partisan relationship between the head of state and the prime minister. Special Model 4 shows that when the former has unilateral dissolution powers (is a dictator in this respect), the incidence of dissolution may differ from that in the baseline model, though the expected direction of this difference is unclear. We might, however, in such circumstances, expect differences in partisanship to be a powerful motive for the head of state. He might be more inclined to dissolve if the prime minister represents a

different party, compared to when the prime minister is a copartisan. Thus, we expect the interaction of presidential dissolution power and partisan differences with the prime minister to promote dissolution, compared to the baseline model.

Hypothesis 6. When the head of state can dissolve unilaterally, early dissolution will be more common when the head of state is of a different party than the prime minister.

The expected net benefits from an early election also depend on how long these benefits can be enjoyed. This, in turn, is a function of the maximum length of the parliamentary term (the CIEP), as well as of the time remaining in the current term. All else equal, the longer the CIEP, the more likely it is that the net benefits from an early election will be positive. Hence, a long parliamentary term should be positively correlated with the incidence of early parliamentary dissolution. Finally, since the continuation value of parliament will decline over the course of the parliamentary term (see above), the expected net electoral benefits for all players should, all else equal, increase as the end of the constitutional term approaches.

HYPOTHESIS 7. The longer a parliament's constitutional term (CIEP), the more common dissolution will be (see Balke 1990, Lupia and Strøm 1995).

Hypothesis 8. The later in a parliament's constitutional term it is, the more common dissolution will be (see Balke 1990, Lupia and Strøm 1995).

#### **EMPIRICAL DESIGN**

We address these questions by examining all 192 elections in 18 parliamentary democracies from 1960 to 1995, inclusive. The sample includes most of the world's stable parliamentary regimes and a particularly high proportion of those in Western Europe. We have, however, excluded some states that have not been democratic throughout the 1960–95 period, such as Greece, Portugal, and Spain. Two additional countries, Switzerland and Norway, have been excluded because neither provides for the constitutional possibility of early elections. See Table 5 for a breakdown of the observations by country. Note that since our sample is relatively small, especially when we break it down into various institutional subcategories, it is difficult to attain conventional standards of statistical significance.

Our analysis occurs in two stages and uses two distinct data configurations. First, we employ standard logistic regression techniques to investigate the frequency of early elections across the countries mentioned above. For this analysis, our observations include all national legislative elections, and the dependent variable is whether or not they were called early. We code as "early" any election that occurs at least 90 days before the end of the constitutional term (CIEP). 9 We

<sup>&</sup>lt;sup>9</sup> The 90-day cutoff divides the sample roughly in half. If a 180-day cutoff date is used instead, the substantive results are quite similar.

then turn to a duration model to investigate these relationships further. For this portion of the analysis, our units are monthly observations of parliaments, and the dependent variable is whether or not an election was called during that month. For cabinet data prior to 1990 we rely on Woldendorp, Keman, and Budge (1993), whereas subsequent cabinet data have been compiled from Keesing's Record of World Events. Our data on dissolution powers has been drawn primarily from the handbooks Parliaments of the World (Inter-Parliamentary Union 1986) and the World Encyclopedia of Parliaments and Legislatures (Kurian 1998). with supplementary data from personal communication with country experts. For bicameral legislatures, our parliamentary data refer to the lower (popular) chamber.

#### DO DISSOLUTION RULES MATTER?

We begin our analysis by examining the effect of institutional rules on the frequency of early elections. Recall that we have four specific hypotheses relating to these issues. First, except in situations where the head of state has unilateral authority, dissolution will be more likely under single-party governments than coalition governments (H1). Second, compared to that in the baseline model, dissolution will be less common when proposal power is vested in the cabinet or the parliamentary

majority (H2). Third, compared to that in the baseline model, dissolution will be more common when the head of state is either powerless or nonpartisan (H3). And, finally, when the head of state has unilateral dissolution power the incidence of dissolution will be different from that in the baseline model (H4).

In the top half of Table 4, we report a set of simple bivariate relationships between the variables just outlined and the incidence of early elections. None of the observed differences are contrary to our expectations, though most are statistically insignificant. As expected, single-party governments call early elections more often (61.6%) than do multiparty governments (51.2%). For hypothesis 2, our results, though weak, are similarly consistent with expectations. For hypotheses 3 and 4, our first look suggests no effects at all.

We also have four hypotheses less directly derived from these models. First, dissolution will be more likely under minority governments than under majority governments (H5). Second, dissolution will be more common under presidential dissolution control when partisan conflict exists between the head of state and prime minister (H6). Third, dissolution will be more common in countries with longer constitutional terms (CIEPs) (H7). And, finally, dissolution will be more likely as the end of the CIEP approaches (H8).

The simple breakdowns for hypotheses 5 through 7 are presented in the bottom half of Table 4. As

hypothesis 5 predicts, early elections are called more frequently under minority governments (70.8%) than under majority governments (51.0%). Yet the interaction between majority and coalition status is particularly interesting. Whereas among majority governments, single-party administrations are more likely than coalitions to dissolve early, the opposite is the case for minority governments, in which case coalition governments call early elections at the impressive rate of 80%. The reason for this reversal among minority governments, we suspect, lies in their vulnerability rather than in strategy. Multiparty minority governments are likely to be the weakest type of parliamentary government, and the high incidence of early elections may reflect their susceptibility to parliamentary defeat rather than strategic and voluntary dissolution on their part.

The results for hypothesis 6 are again in the expected direction. In other words, early elections appear to be more common when the head of state and prime minister represent different parties (62.5%) rather than when they are copartisans (41.7%). Finally, the expectations of hypothesis 7 are strongly supported, with early elections being called more frequently as the CIEP increases. In countries with a CIEP of three years, only 26.5% of all parliaments are dissolved early, whereas in countries with a CIEP of four or five years early elections are called 56.4% and 73.2% of the time, respectively.

Our final concern here is whether early elections become more common as the parliamentary term wears on. Table 5 lists our countries in declining order of the incidence of dissolution, specifically by the proportion of parliaments dissolved before the 95th percentile of their term. Using a proportional measure for simplicity of comparison, Table 5 also clearly shows that the incidence of parliamentary dissolution increases toward

the end of the parliamentary term. Of the 110 parliaments dissolved before the 95th percentile of their regular term, nearly half (53) were in fact dissolved after the three-quarter mark (the 75th percentile). That is, almost as many parliaments were dissolved during that 20% of their terms than during the preceding 75% combined. Let us look more closely at this rising rate of parliamentary dissolution. During the first quarter of their terms, no more than 8 of our 192 parliaments were terminated, which amounts to only 4.2%. Over the next quarter of the terms, 16 of the remaining 184 parliaments were dissolved, or 8.7%. The third quarter claims another 33 of 168 survivors, or 19.6%. Finally, 53 parliaments come to an end during the next 20% of the term, or 39.3% of the remnant of 135. Clearly, hypothesis 8 is supported: The later in the term it is, the more likely parliamentary dissolution becomes. In fact, the probability of dissolution roughly doubles with each passing quarter of the constitutional term.

We continue our empirical analysis by reporting a set of multivariate logit models of the frequency of early elections. For this portion of the analysis, the dependent variable equals 1 if an election was called early (before the last 90 days of the constitutional term) and 0 otherwise. The independent variables of model 1 include only those variables directly derived from our special models, along with the CIEP variable. Describically, Single-Party Interaction is an interaction between single-party governments and all dissolution rules except unilateral heads of state, taking on a value of

<sup>&</sup>lt;sup>10</sup> The justification for including the CIEP variables in this initial specification is that their effects are constant across the players in our game. Without their inclusion, we believe that the institutional model will be underspecified and that we will not get an accurate picture of the institutional effects.

1 when those conditions hold and 0 otherwise; Unilateral Head of State = 1 if dissolution power is controlled by a unilateral head of state and 0 otherwise; Powerless Head of State = 1 if the head of state has no role in dissolution and 0 otherwise; Cabinet or Parliamentary Proposal Power = 1 if dissolution proposal power is controlled by the cabinet or parliamentary majority and 0 otherwise; Ciep4 = 1 if the constitutional term is four years and 0 otherwise; and Ciep5 = 1 if the constitutional term is five years and 0 otherwise. The institutional baseline is effectively equal to our baseline model, whereas the excluded category for CIEP is a three-year term. Model 2 incorporates the two "noninstitutional" variables of our analysis, specifically, Partisan Conflict = 1 if there is a unilateral head of state whose prime minister represents a different party and 0 if the head of state and prime minister are from the same party, and Minority = 1 if the government lacks a parliamentary majority and 0 otherwise.

In Table 6, we report the estimates for these two models. The purely institutional model (model 1) clearly confirms that parliamentary dissolution is less common when controlled by the cabinet or parliamentary majority (hypothesis 2). Our expectation that dissolution will be more common with a nonpartisan or powerless head of state is also supported (hypothesis 3). As to the effect of a single-party government on dissolution (hypothesis 1), the observed effect is in the correct direction but insignificant. And the effect of having dissolution power unilaterally vested in the head of state (hypothesis 4) is effectively nonexistent. Recall that we had no clear directional expectation concerning this variable because of the potentially countervailing effects of such an institutional arrangement. The results, therefore, may suggest that these effects cancel each other out in the aggregate. Finally, our expectations concerning the effects of term length (hypothesis 8) are strongly confirmed by the two CIEP dummy variables. The longer the constitutional term, the higher the incidence of early dissolution.

When we add the noninstitutional variables to the equation in model 2. the results of model 1 are reaffirmed. Our estimates of the institutional effects remain unchanged. Among the added variables, minority government enhances the incidence of dissolution, just as we expected (hypothesis 5). The other purpose of model 2 is to try to sort out some of the conflicting effects of vesting dissolution power unilaterally in the head of state. As we expected, the incidence of dissolution goes up when there is partisan disagreement between the president and the prime minister (hypothesis 6). The results also show that, absent such partisan conflict, heads of state are less likely to dissolve than are prime ministers. Yet neither of these effects is statistically significant. In sum, then, no coefficient in either specification of our model has an unexpected sign, even though some of these effects fail to reach conventional levels of statistical significance.

These logistic regression models require us to treat dissolution as a binary variable. For a given parliament, either early dissolution happens or it does not. Yet this is of course a rather crude operationalization, and it is one that does not capture the full force of our argument. It is not just that certain conditions should facilitate dissolution. The likelihood of dissolution should also increase over the course of the constitutional term (hypothesis 7). To test this expectation more cleanly, we conclude our empirical analysis by introducing a simple Cox proportional hazard duration model. Here, our observations are monthly, and the dependent variable is whether or not an election is held during the specific month in question.

The independent variables are identical to those reported in Table 6, with two exceptions. To capture the temporal effects suggested in hypothesis 7, we have included a time count variable, *Time Left*, which corresponds to the number of days left in the constitutionally prescribed term (CIEP). Our expectation is there will be a negative relationship between this variable and the incidence of dissolution, which is to say that the more

time is left in the constitutional term, the less likely it is that an election will be called. The introduction of this variable, however, creates severe collinearity problems if we also seek to include both CIEP dummy variables. We have therefore been forced to substitute a single dummy to capture all terms longer than three years. Thus,  $Ciep4\_5=1$  if the constitutional term is four or five years and 0 otherwise. Finally, because it is impossible to know whether parliaments in the last month of their constitutional term would have been dissolved voluntarily, we have censored all observations within their last month of the CIEP.

Our results, which are reported in Table 7, are broadly consistent with the logistic regression results in Table 6, though in some cases slightly weaker. Again, hypotheses 2, 6, and 7 are clearly supported. In addition, the temporal effect is as we expected: The less time left in the constitutional term, the greater the likelihood of dissolution (hypothesis 8). Moreover, dissolution is, once again, more common under a powerless or nonpartisan head of state, but in these models the effect shrinks to statistical insignificance. Much as in the logit model, the effects of a single-party government are in the expected direction but too weak to be statistically significant. It appears that the expected tendency for single-party governments to precipitate early elections holds for majority but not for minority governments, perhaps because, among the latter, parliamentary vulnerability trumps strategic behavior. Finally, we find the same countervailing but relatively weak effects of vesting dissolution power unilaterally in the president. In sum, we find no results in any of the four specifications of our model that run directly contrary to our expectations. But while some of our hypotheses are consistently supported, other results are not always strong or equal to conventional standards of statistical significance.

### **CONCLUSIONS**

Polities all over the world are contending with issues of institutional reform. These efforts are based on the explicit or implicit belief that institutions, and the ways in which they structure the policy agenda, matter. We concur. It is therefore surprising that one important institutional mechanism, the authority to dissolve parliament and call early elections, has received such scant attention among political reformers and scholars. Although the power of parliamentary dissolution is a key feature of most parliamentary democracies, it varies substantially from one such system to the next. And even though dissolution powers can be designed to give specific constitutional actors significant agenda powers, there has been very little systematic study of this institution.

Ideally, dissolution provisions can be used to counteract the "temporal rigidity" with which Linz (1994) is so concerned. Yet we have little reason to believe that the actual use of parliamentary dissolution powers is motivated by the need to solve serious political crises. The nations with the highest incidence of early elections, such as Ireland and Denmark (see Table 5), are characterized by vigorous electoral competition rather than systemic instability. Nor does parliamentary dissolution seem to correlate with cabinet instability. The three European countries with the highest rates of cabinet turnover, Italy, Finland, and Belgium (Müller and Strøm 2000, 585), have only middling frequencies of early dissolution. Thus, there is little evidence to suggest that parliamentary dissolution tends to occur in response to systemic crises or parliamentary deadlock. 11

On the contrary, it appears that the employment of this mechanism can be more plausibly understood as a strategy employed by self-interested or partisan prime ministers or presidents with particular constitutional powers. Such powers are of particular interest to the political observer when they can be used to confer a partisan advantage on those in whom they have been vested.

<sup>&</sup>lt;sup>11</sup> Consider the Italian Parliament elected on June 7, 1953. During its term, six successive cabinets were formed, including two that failed their initial vote of investiture. One prime minister, Adone Zoli, found himself dependent on neofascist support and asked to be relieved of his office. His request was refused. Yet no election was called by either President Einaudi (1948–55) or President Gronchi (1955–62) until the end of the regular parliamentary term in 1958.

Our interest in dissolution powers has focused precisely on identifying systematic institutional differences that may affect the frequency with which dissolution powers are exercised for partisan advantage. Building on several recent works in the neo-institutional tradition, we have used a set of simple game-theoretic models to formulate a set of specific hypotheses concerning the effects and strategic use of parliamentary dissolution powers.

Our models show that veto powers, such as may be vested in the head of state, matter. And as Tsebelis (2002) generally suggests, the more veto players, the less likely a change from the status quo (here, a parliamentary dissolution). But not all relevant players are in fact veto players. Some may instead be decisive players or simply (such as the coalition partner in the baseline model) powerful players (Strøm 1995). Decisive or powerful players may also contribute to dissolution, but not necessarily in the same way that a veto player would. To understand parliamentary dissolutions, it is necessary to model the powers of each player carefully.

Our empirical results confirm that institutional rules significantly affect the incidence of strategic parliamentary dissolution. We have found strong evidence that the likelihood of parliamentary dissolution increases substantially and apparently monotonically as the end of the constitutional term approaches. Indeed, the hazard rate of parliaments to dissolution seems to fit an exponential function remarkably well. In examining who dissolves parliament, our strongest results are (1) that dissolution powers are used more frequently by minority governments, (2) that the longer the parliamentary term, the more common is dissolution, and (3) that early elections are less frequent if the power to propose them rests with the cabinet as a whole or the parliamentary majority.

Our analysis supports many of the analytical results of Balke (1990) and Smith (1996). Incumbents do seem to use dissolution powers strategically and for partisan purposes. But we also demonstrate that institutions significantly affect and constrain the ability of incumbent politicians to engage in such timing decisions. The question in constitutional design, then, is what price to pay in partisan opportunism for the flexibility that dissolution powers afford.

#### **APPENDIX**

We here state more fully and precisely the conditions under which parliamentary dissolution occurs in each of our models. The results for the baseline model are presented first, then those of the various special models. We proceed by backward induction and employ the subgame perfect Nash equilibrium solution concept. Please refer to Figures 1 and 2 for an extensive-form representation of the games, to Table 2 for a presentation of the payoff matrix, and to Table 3 for a summary of the equilibrium conditions.

#### **Baseline Model**

Head of State. We first describe the behavior of the head of state at the last stage of the game. In the upper subgame (when the prime minister has proposed and the coalition partner acquiesced), the head of state will dissolve if and only if  $E_{\rm H} > -V_{\rm U}$ . Otherwise, he will veto. In the lower subgame (when the prime minister has proposed and the coalition partner dissented), the head of state will dissolve whenever  $E_{\rm H} > -V_{\rm L}$  and otherwise veto.

Coalition Partner. We next describe the behavior of the coalition partner at the penultimate stage of the game. Her choices depend on her own payoffs, as well as on her expectations concerning the subsequent behavior by the head of state. For the coalition partner to dissent, two conditions must be satisfied simultaneously: (1) her own incentive condition (she must prefer dissenting and getting the status quo to dissolution), and (2) upon her dissent, the head of state must proceed to veto dissolution. There are three possible configurations of the head of state's preferences: (1)  $E_{\rm H} > -V_{\rm L} > -V_{\rm U}$ , (2)  $E_{\rm H} < -V_{\rm U} < -V_{\rm L}$ , and (3)  $-V_{\rm L} > E_{\rm H} > -V_{\rm U}$ . Only the third of these configurations would satisfy the second condition above. The full set of configurations bearing on the coalition partner's decision, and the related equilibrium conditions in the subgame, are thus as follows.

- 1. If  $E_{\rm H} > -V_{\rm L} > -V_{\rm U}$  and  $E_{\rm C} > -D$ , then acquiesce, dissolve
- 2. If  $E_{\rm H} > -V_{\rm L} > -V_{\rm U}$  and  $E_{\rm C} < -D$ , then acquiesce, dissolve
- 3. If  $E_{\rm H} < -\dot{V}_{\rm U} < -V_{\rm L}$  and  $E_{\rm C} > -D$ , then acquiesce, veto (outcome II).
- 4. If  $E_{\rm H} < -V_{\rm U} < -V_{\rm L}$  and  $E_{\rm C} < -D$ , then acquiesce, veto (outcome II).
- 5. If  $-V_L > E_H > -V_U$  and  $E_C > -D$ , then acquiesce, dissolve (outcome I).
- 6. If  $-V_L > E_H > -V_U$  and  $E_C < -D$ , then dissent, veto (out-

Note that outcome III never occurs in equilibrium in this subgame, because  $E_C - D < E_C$ , by definition. Hence, the coalition partner will not dissent when she knows that the head of state will not veto.

Prime Minister. Finally, we describe the necessary and sufficient conditions for the prime minister to propose dissolution, as well as the equilibrium in each case. In describing these, we refer to the configurations of preferences of the head of state and the coalition partner by the numbers with which they have been identified above (1 through 6). For the prime minister to propose dissolution, his incentive condition must be satisfied, which means that  $E_P - P > 0$ . Moreover, the prime minister will not propose in any situation that would lead to outcome II or outcome IV, both of which would give him a payoff of -P, which by definition is <0. In other words, the prime minister will not make any proposal that he knows will be vetoed. Hence, the prime minister will not propose in configurations 3, 4, and 6 above. Thus,

- 1. If  $E_P P < 0$ , then not propose (outcome V).
- 2. If  $\vec{E_P} P > 0$  and (1), then propose, acquiesce, dissolve
- 3. If  $E_P P > 0$  and (2), then propose, acquiesce, dissolve (outcome I).
- 4. If  $E_P P > 0$  and (3), then not propose (outcome V). 5. If  $E_P P > 0$  and (4), then not propose (outcome V).
- 6. If  $E_P P > 0$  and (5), then propose, acquiesce, dissolve (outcome I).
- 7. If  $E_P P > 0$  and (6), then not propose (outcome V).

In summary, there are three payoff configurations that jointly constitute the necessary and sufficient conditions for dissolution (Outcome I), namely, those numbered 2, 3, and 6 above. Thus, dissolution occurs if and only if

$$E_{\rm P} - P > 0$$
,  $E_{\rm H} > -V_{\rm L} > -V_{\rm U}$ , and  $E_{\rm C} > -D$ , or  $E_{\rm P} - P > 0$ ,  $E_{\rm H} > -V_{\rm L} > -V_{\rm U}$ , and  $E_{\rm C} < -D$ , or  $E_{\rm P} - P > 0$ ,  $-V_{\rm L} > E_{\rm H} > -V_{\rm U}$ , and  $E_{\rm C} > -D$ .

These conditions can in turn be summarized as follows: Dissolution will occur if and only if either (1)  $E_P - P > 0$  and  $E_H > -V_L$ , or (2)  $E_P - P > 0$ ,  $E_C > -D$ , and  $E_H > -V_U$ .

Under all other conditions, no proposal will be made (outcome V). Note that the prime minister prevents any realization of outcomes II and IV, whereas the coalition partner blocks outcome III.

#### **Special Model 1**

In this model, the head of state will dissolve whenever  $E_{\rm H} > -V_{\rm U}$ . Otherwise, he will veto. The prime minister proposes dissolution whenever his own incentive condition is satisfied and he knows that the head of state will dissolve. Hence, dissolution will occur if and only if  $E_{\rm P} - P > 0$  and  $E_{\rm H} > -V_{\rm U}$ .

#### **Special Model 2**

In this model, the head of state can dissolve only in what corresponds to the upper subgame of the baseline model, when the prime minister has proposed and the coalition partner acquiesced. As in the upper subgame of the baseline model, the head of state will dissolve whenever  $E_{\rm H} > -V_{\rm U}$ . Otherwise, he will veto

Special model 2 transforms the coalition partner into a veto player. Yet her choices depend on her own payoffs, as well as on her expectations concerning the subsequent behavior by the head of state. For the coalition partner to dissent, two conditions must be satisfied: She must prefer the payoff from dissent to dissolution (which is to say that  $E_{\rm C}<-D$ ), and she must know that the head of state would not have vetoed regardless. There are two possible configurations of the head of state's preferences: (1)  $E_{\rm H}>-V_{\rm U}$ , and (2)  $E_{\rm H}<-V_{\rm U}$ . The full set of configurations bearing on the coalition partner's decision and the related equilibrium conditions in the subgame are thus as follows.

If  $E_{\rm H} > -V_{\rm U}$  and  $E_{\rm C} > -D$ , then acquiesce, dissolve (outcome I)

If  $E_{\rm H} > -V_{\rm U}$  and  $E_{\rm C} < -D$ , then dissent (outcome III).

If  $E_{\rm H} < -V_{\rm U}$  and  $E_{\rm C} > -D$ , then acquiesce, veto (outcome II).

If  $E_{\rm H} < -V_{\rm U}$  and  $E_{\rm C} < -D$ , then acquiesce, veto (outcome II).

Finally, the prime minister will propose dissolution only if his incentive condition is satisfied, which means that  $E_P - P > 0$ . In addition, the prime minister will not propose if that would lead to outcome II (veto by the head of state) or outcome III (veto by the coalition partner), both of which would give him a payoff of -P (which by definition is <0). Hence, the prime minister proposes only under the first of the conditions above, and the necessary and sufficient conditions for dissolution are  $E_P - P > 0$ ,  $E_H > -V_U$ , and  $E_C > -D$ .

#### **Special Model 3**

In this model, the head of state will always dissolve if asked, either because his incentive condition is always satisfied or because he has no power to veto. The coalition partner will then never dissent, since such behavior is costly and could never induce the head of state to veto dissolution. Since the head of state will thus always dissolve and the coalition partner

never dissent, the prime minister proposes dissolution whenever his incentive condition is satisfied, that is, if and only if  $E_P - P > 0$ . This, then, is the necessary and sufficient condition for dissolution in special model 3.

#### Special Model 4

In special model 4, the head of state can dissolve unilaterally and is thus a dictator rather than a veto player. Since agenda control then rests with the head of state himself, there are no veto costs. The necessary and sufficient condition for dissolution hence reduces to  $E_{\rm H} > 0$ . In other words, when the head of state can dismiss parliament unilaterally, dissolution depends strictly on whether he prefers elections to the status quo.

# Commerce, Coalitions, and Factor Mobility: Evidence from Congressional Votes on Trade Legislation

MICHAEL J. HISCOX Harvard University

The extent to which political conflict over U.S. trade policy has led to clashes between broad-based class coalitions has varied significantly over time during the past two centuries. I argue that much of this variation can be explained by changes in economywide levels of interindustry factor mobility. Class distinctions between voters are more economically and politically salient when interindustry mobility is high; when mobility is low, industry distinctions become more critical and tend to split apart broader political coalitions. I report evidence indicating large changes in levels of labor and capital mobility over the last two centuries. These changes coincide with significant shifts in the character of American trade politics. Analysis of congressional voting on 30 major pieces of trade legislation between 1824 and 1994 provides evidence of large swings in coalition patterns.

istory has shown that international trade can generate intense class conflict, pitting capital against labor, or farmers against industry, and making the tariff the central policy issue in electoral competition between political parties. In the United States, at the turn of the twentieth century, the trade issue did ignite a fierce political contest between protrade farmers and protectionist urban interests, and the tariff became the focal point for the parties in virtually every election fought between 1888 and 1914. But this type of intense class warfare was not the norm in American trade politics prior to the Civil War, when battles over policy were dominated by regionally specific, industrybased groups (Pincus 1977), nor has it continued in more recent times, when policies have been shaped in large measure by the lobbying efforts of industry associations, labor unions, and political action committees, and the trade issue has all but vanished at election time (Destler 1992).

In what circumstances does international trade deepen class cleavages in politics? When do narrower, industry-based coalitions tend to flourish instead? The existing scholarly literature is largely silent on the question and strangely polarized. While Rogowski (1989) presents evidence that trade can create class divisions that are so fundamental that they can reshape entire political systems, much of the recent analysis of American trade politics follows Schattschneider (1935) in placing industry-based lobbies at center stage (Baldwin 1985; Grossman and Helpman 1995). This division mirrors a more fundamental divide between Marxist political economy, in which all politics is class politics, and pluralist-style approaches to American politics that focus on the activities of interest groups. Bridging the gap is vital for understanding the political-economic origins of not only trade policy, but a vast range of regulatory, industrial, and monetary policies that can

create class antagonisms and yet also affect the relative fortunes of different industries. What is at issue is the definition of the basic building blocks of political economy: the alignment of preferences that creates political coalitions.

I argue here that variation in coalition patterns can be explained in large measure by changes in economywide levels of interindustry factor mobility: that is, the ease with which owners of factors of production (land, labor, and capital) can move between industries. Class distinctions between voters are more economically and politically salient when interindustry mobility is high; when mobility is low, industry distinctions become more critical and tend to split apart broader political coalitions. I report evidence indicating large changes in levels of labor and capital mobility over the last two centuries. These changes coincide with significant shifts in the character of American trade politics. Analysis of congressional voting on 30 major pieces of trade legislation between 1824 and 1994 provides evidence of large swings in coalition patterns. The findings carry important implications for political-economic studies of economic policymaking in general, for the future direction of U.S. trade policy, for future economic growth, and for arguments in favor of adjustment assistance programs that would raise levels of interindustry factor mobility.

## TRADE THEORY, COALITIONS AND FACTOR MOBILITY

According to the Stolper–Samuelson (1941) theorem, trade increases real returns for owners of the factor of production with which the economy is relatively abundantly endowed, while real returns for owners of the scarce factor decline. This result depends critically on the assumption that factors of production, while immobile internationally, are perfectly mobile within the domestic economy. The logic is simple enough: Increased trade lowers the price of the imported good, leading to a reduction in its domestic production and

<sup>&</sup>lt;sup>1</sup> Factors are identified as broad categories of productive inputs and include at least labor and capital. Traditional studies focus on land, labor, and capital, though the case has been for subdividing these into narrower categories (Leamer 1984).

freeing up more of the factor it uses relatively intensively (the scarce factor) than is demanded elsewhere in the economy at existing prices. When factor prices adjust, returns to the scarce factor fall even further than the price of the imported good, while returns to the abundant factor rise even further than the price of the exported good. The interindustry mobility of the factors assures that trade affects owners of each factor in the same way no matter where they are employed in the economy. This is the insight that encouraged Rogowski (1989) to anticipate broad-based conflict among owners of land, labor, and capital in trade politics.<sup>2</sup>

Very different results are generated by alternative types of models (often referred to as "Ricardo-Viner" models) in which one or more factor of production is assumed to be immobile between industries (Jones 1971; Mussa 1974, 1982).<sup>3</sup> In these models, the returns to "specific" factors are tied closely to the fortunes of the industry in which they are employed. Factors specific to export industries receive a real increase in returns due to trade, while those employed in import-competing industries lose in real terms. 4 Factor specificity thus drives a wedge between members of the same class employed in different industries. The implication is that political coalitions form along industry lines, and this has guided much of the empirical analysis in the "endogenous policy" literature in economics that relates variation in import barriers across industries to the relative political strength of different industry-based groups (e.g., Anderson 1980; Lavergne 1983).

The Stolper–Samuelson and Ricardo–Viner models examine extreme, or polar, cases, in which productive factors are either perfectly mobile or specific. Factor mobility is better regarded as a continuous variable, affected by a range of economic, technological, and political conditions. Allowing that factors can have varying degrees of interindustry mobility, the simple prediction is that broad class-based political coalitions are more likely where factor mobility is high, while narrow industry-based coalitions are more likely where mobility is low. The trade issue—and, in fact, any policy

issue that affects relative commodity prices—will divide an economy into very different types of coalitions if there is substantial variation in levels of interindustry factor mobility (see Appendix A for a formal, general-equilibrium treatment).

### EVIDENCE OF TRENDS IN FACTOR MOBILITY IN THE U.S. ECONOMY

#### **Measuring Interindustry Factor Mobility**

Given the obvious importance of interindustry factor mobility in determining the income distribution effects of trade (and, hence, the politics of trade), it is vexing, as Grossman and Levinsohn (1989) have pointed out, that very few attempts have actually been made to assess levels of mobility empirically. The most direct evidence has been provided in work on industry wage differentials (e.g., Krueger and Summers 1988), the response of stock-market returns to import price shocks (Grossman and Levinsohn 1989), and prices in secondary markets for capital equipment (Ramey and Shapiro 1998). All these studies suggest significant factor specificity and sizable industry rents in U.S. manufacturing in recent years, but we do not have a historical standard of reference with which to compare these findings.

To compare levels of factor mobility in the U.S. economy in different periods, I have examined the variation between rates of return for factors employed in different industries. This is simply an application of the "law of one price." If factors are highly mobile (i.e., movable), return differentials should be arbitraged away by (actual or potential) factor movement. Smaller differentials in wages and profits across industries are thus indicators of higher levels of mobility. The magnitude of the differentials will reflect the costs of moving factors between industries, which are influenced by a range of economic and political variables, including the specificity of human and physical capital to particular firms and industries, any factor market regulations that affect firm entry and exit and hiring and firing, any policies that assist relocation and retraining, and the costs of transportation and communication. Different versions of this type of measure have been used previously in a wide range of studies of labor and capital mobility.8

<sup>&</sup>lt;sup>2</sup> Classes are defined here simply in terms of factor ownership: Each factor class comprises those individuals well endowed with a factor relative to the economy as a whole. This definition allows for the fact that individuals often own a mix of factors (Mayer 1984).

<sup>&</sup>lt;sup>3</sup> The original model was introduced independently by Jones (1971) and Samuelson (1971): The former christened it the "specific-factors" model, while the latter named it the "Ricardo-Viner" model.

<sup>&</sup>lt;sup>4</sup> Again, the logic is straightforward: A decrease in the domestic production of an imported good releases any mobile factors for employment elsewhere in the economy and thus renders factors specific to the import-competing industry less productive, driving down their real returns. Returns on the mobile factor rise relative to the price of the imported good but fall relative to the price of exports, so that the income effects of trade for owners of this factor depend on patterns of consumption.

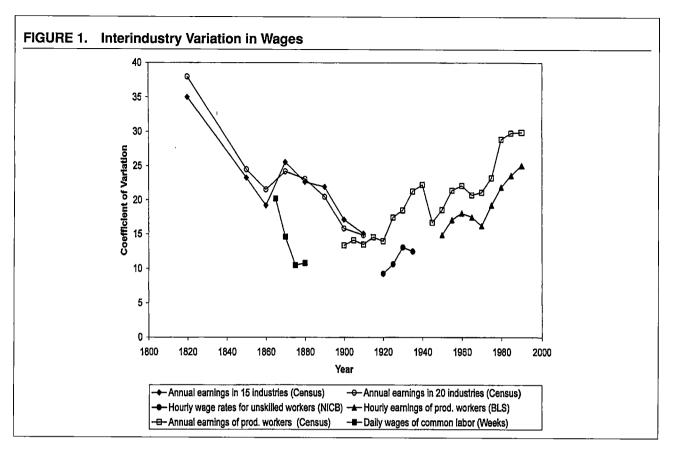

<sup>&</sup>lt;sup>5</sup> The bifurcation is generally considered unproblematic in the economics literature: Specific-factors effects are regarded as important in the short term but not the long term (Caves et al. 1990, 146–49; Krugman and Obstfeld 1988, 81; Mussa 1974). It is simply assumed that, over time, all factors are perfectly mobile. But this ignores politics: Factor owners do not just choose between accepting their returns in one industry and moving to another, they can also lobby to influence policy (and hence returns).

<sup>&</sup>lt;sup>6</sup> Magee (1980) examined the "revealed preferences" of industry groups to make inferences about mobility in his much-cited study of testimony by labor unions and management groups before the House Ways and Means Committee on the Trade Act of 1974.

<sup>7</sup> In contrast, a great deal of the contrast a great deal of the contrast and the Trade Act of 1974.

<sup>&</sup>lt;sup>7</sup> In contrast, a great deal of empirical work has been done on the interregional mobility of labor and capital in the American economy aimed explicitly at uncovering historical trends, with much of the attention focused on the geographic integration of the markets for labor and capital during the nineteenth century (e.g., Coelho and Shepherd 1976; Davis 1965; Lebergott 1964; Odell 1989; Rosenbloom 1990).

<sup>&</sup>lt;sup>8</sup> On industry wage variance in recent years, see Dickens and Katz 1987, Gibbons and Katz 1992, Katz and Summers 1989, and Krueger and Summers 1987, 1988. Almost all the work on the geographic integration of U.S. labor and financial markets has focused upon regional differences in wages and interest rates, and rate-of return differentials have also been used to gauge the level of international capital mobility (e.g., Frankel 1991).

There are good reasons for exercising caution when examining wage and profit differentials, since they may partly reflect other features of factor markets besides mobility (these issues are discussed further below). It is the size of industry rents that is key for the political story here, however, and wage and profit differentials are the clearest measure we have of whether such rents actually exist.<sup>9</sup>

#### Interindustry Variation in Wages and Profits

Following Long (1960) I use data on wage payments reported in the decennial census to calculate annual wages for workers in major manufacturing industries (approximates of the modern two-digit Standard Industrial Classification [SIC] categories) for each census year beginning in 1820. I also calculated average daily wages of "common laborers" in each of these industries from the payroll records of firms compiled in the Weeks report of 1886. After the turn of the century, evidence

on annual wages of production workers in two-digit SIC industries is readily available from the Department of Commerce, <sup>12</sup> hourly earnings for production workers are calculated after 1947 by the Bureau of Labor Statistics (BLS), <sup>13</sup> and separate data on hourly wages for unskilled workers between 1920 and 1937 were compiled by the National Industrial Conference Board (Glasser 1940, 36).

Using each of the data series to calculate coefficients of variation across industries yields an interesting set of results. The data, shown in Figure 1, indicate two broad trends: a general decline in interindustry variation in wages over the course of the nineteenth century, consistent with a marked rise in interindustry labor mobility, and a general increase in wage variation beginning sometime between the 1910s and the 1930s, indicating a steep decline in interindustry mobility more recently. These different trends have been noted separately by analysts focusing on particular eras (e.g., Atack, Bateman, and Margo 2000; Bell and Freeman 1991), and the evidence of sizable differences in wages across industries in recent years is also consistent with much recent work by labor economists using more detailed survey data on individual workers (e.g., Dickens and

<sup>&</sup>lt;sup>9</sup> Hiscox (2002) provides a detailed discussion and treatment of these measurement issues and a more detailed analysis of all the available evidence on historical trends in U.S. factor mobility.

<sup>&</sup>lt;sup>10</sup> I began with the 17 industries examined by Long (1960, 72–73) for the period 1860 to 1890, amending the list to extend the series for 15 of these industries for which data are available over the period 1820 to 1910. I then created a separate series for 20 industries, adding five categories that were excluded from Long's study but for which data exist over the full span of years. All lists, and original data, are available from the author.

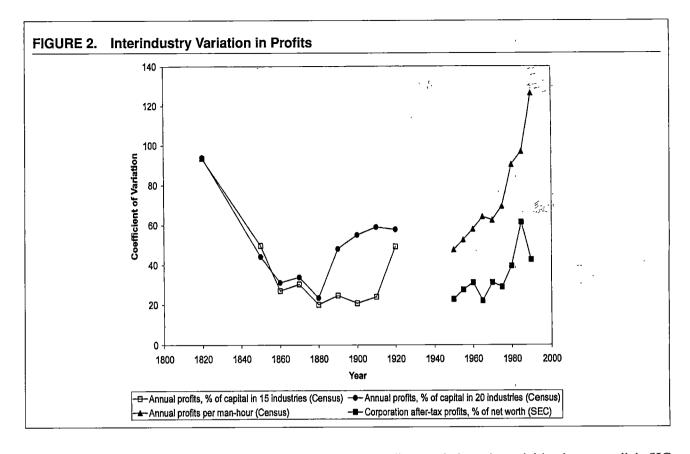

<sup>&</sup>lt;sup>11</sup> The Weeks report was published as U.S. Congress, House (1886). I calculated simple averages across firms in Massachusetts, New York,

and Pennsylvania only (since all data were entered manually for each firm).

firm).

12 See the U.S. Department of Commerce's, *Census of Manufactures* and *Annual Survey of Manufactures* (various years). Beginning in 1900, earnings data are reported for 15 two-digit SIC industries; from 1947, they are reported for 19 industries.

<sup>&</sup>lt;sup>13</sup> See the U.S. Bureau of Labor Statistics' Employment and Earnings (various years).

Katz 1987; Krueger and Summers 1988). <sup>14</sup> As Figure 1 indicates, the size of these much-discussed "industry rents" trended downward markedly during earlier stages of industrialization and upward only more recently. <sup>15</sup>

There is very little direct evidence on firm profits in different industries prior to 1909, when federal taxes were first imposed on corporate incomes (Epstein and Gordon 1939, 122). Beginning in 1933, data from annual reports on corporation profits (as percentages of net worth and equity) are available from the U.S. Securities and Exchange Commission (SEC), categorized

according to their main activities into two-digit SIC industries. <sup>16</sup> For earlier years, following Bateman and Weiss (1981), I used census manuscripts to calculate profits (value-added minus wage costs) as a percentage of the capital invested for firms in each of the major manufacturing industries in each census year. After 1919, the Department of Commerce ceased reporting data on capital invested, but from 1947 reports total man-hours consumed per year for each industry, and these can be used as a proxy for total investments. <sup>17</sup>

Figure 2 charts coefficients of variation in profits across manufacturing industries using these different data series. The results generally match the pattern exhibited in the wages data. There was a general decline in interindustry variation in profits over most of the nineteenth century, indicating a sharp rise in capital mobility, but then a long-term increase in profit differentials beginning some time between the 1880s and the 1910s, indicating a significant decline in interindustry capital mobility since then. <sup>18</sup> The evidence suggesting high levels of capital specificity in recent years matches

<sup>&</sup>lt;sup>14</sup> Only very basic controls can be applied in the aggregate data to account for heterogeneity in skill levels across industries. There is strong evidence, however, that interindustry differences in skill mixes are quite stable over time and controlling for a greater range of individual skill variables is not important for estimating the *relative* size of differentials over time. See Hiscox 2002 and Krueger and Summers 1987

<sup>15</sup> Note too that the latter trend fits with evidence of a long-term decline in quit rates among manufacturing workers since 1919 (Hiscox 2002; Ragan 1984) and with survey data on job tenure that show that the number of years spent on the same job by the average worker rose substantially between 1950 and 1990. Workers aged 55 to 64 were at their jobs an average of 16.0 years in 1991, compared with 9.5 years in 1951; those aged 45 to 54 had been at their jobs an average of 12.2 years in 1991, up from 7.9 years in 1951; and for those in the 35 to 44 age bracket the average tenure rose to 7.9 years in 1991 from 4.3 years in 1951. Data are from the Employee Benefits Research Institute; see The Economist, January 28, 1995. Economists have noted that these data clash violently with the widely held perception that the U.S. workforce has become increasingly mobile in response to globalization and technological change; see reports in The Economist, January 28, 1995, and in The New York Times, April 1993.

<sup>&</sup>lt;sup>16</sup> The data are reported by the U.S. Securities and Exchange Commission, in *Survey of American Listed Corporations: Corporation Profits* (various years), and the U.S. Department of Commerce, in *Statistical Abstract of the United States* (various years).

<sup>&</sup>lt;sup>17</sup> This follows Alt et al. 1999. Note that the industry lists used for calculations of profit variation are identical to those used in the analysis of wages.

<sup>&</sup>lt;sup>18</sup> There are no controls here for cross-industry differences in risk or demand shocks, but Hiscox (2002) reports matching results using measures of profits disaggregated to the four-digit SIC level to estimate equations and control for industry-specific risk and demand-side variables.

#### Industrialization and Factor Mobility

The evidence indicates that there have been substantial changes over time in general levels of interindustry labor and capital mobility in the U.S. economy. The pattern that emerges—rising mobility during most of the nineteenth century, falling mobility in recent decadescan be explained by the technological transformations associated with industrialization. Historical accounts of American economic development have emphasized a range of technological changes that combined to make the economy more fluid during the early stages of industrialization in the nineteenth century (e.g., Sokoloff and Villaflor 1992). Major innovations in systems of water, rail, and road transportation drastically lowered the costs of factor movement and lessened the importance of geography to economy (Davis, Hughes, and McDougall 1961, 276-96). Labor migration and capital flows grew markedly (Perloff 1965). Agricultural producers were affected too, as distance from markets and resources became less important for the location of production. At the same time innovations in manufacturing technology had profound implications for interindustry mobility. New mills and factories replaced craft shops and home manufacture, and the old skills of the artisan class were rendered obsolete (Sokoloff and Villaflor 1992). Much of the new factory technology was readily adaptable to use in alternative industries (Landes 1969, 293-94) and created a vast demand for unskilled labor, making it far easier for industrial workers to shift between jobs in different industries (Sokoloff 1986).<sup>20</sup>

Around the turn of the century, however, technological changes in manufacturing began to reverse these trends. Most important was the growing complementarity between labor skills and the newest technology (Bartel and Lichtenberg 1987; Griliches 1969; Hamermesh 1993). The key change appears to have taken place in the 1910s and 1920s with the move from assembly-line to continuous-process technology—the latter requiring more skilled workers in the management and operation of highly-complex tasks (Cain and Paterson 1986; Goldin and Katz 1996). Growth in the demand for specialized human capital has been concomitant with continued technological improvements

since that time (Mincer 1984). Job tenure rose along with training in firm-specific skills (Carter and Savocca 1990; Sundstrom 1988). Meanwhile, barriers to exit and entry for manufacturing firms appear to have risen markedly along with the growing importance of specialized technologies (Ramey and Shapiro 1998) and as a function of the higher start-up costs and increased investments in physical capital associated with the general growth in the scale of production (Caves and Porter 1979).<sup>21</sup>

## COALITION PATTERNS IN U.S. TRADE POLITICS: CONGRESSIONAL VOTES, 1824–1994

#### **Expectations and Evidence**

In light of the evidence that levels of interindustry factor mobility have varied substantially in the American economy over time, the question remains as to whether these changes have produced the expected changes political coalitions. If the argument advanced above is correct, the formation of broad factor-owning class coalitions should have been most likely during periods when interindustry factor mobility was relatively high (between the 1880s and the 1920s), while narrow industry-based coalitions should have been most likely in periods when interindustry mobility was relatively low (earlier in the nineteenth and later in the twentieth centuries).<sup>22</sup>

These expectations do fit with some of the stylized historical facts of American trade politics. According to standard accounts, trade politics was a predominantly local, group-based affair at the beginning of the nineteenth century. The emerging political parties were split over the tariff issue along regional lines and trade legislation reflected the competing pressures placed on Congress by a vast array of locally organized groups (Pincus 1977; Stanwood 1903, 240-43; Taussig 1931, 25-36). In the years following the Civil War, however, trade became the partisan issue in American politics, as Republicans, drawing broad support mostly from business and labor, supported high protectionist tariffs over the vehement opposition of Democrats and their largely rural constituency (Stewart 1991, 218; Taussig 1931, chaps. 5-8; Verdier 1994, 108-15).

<sup>&</sup>lt;sup>19</sup> Note too that increasing capital specificity in recent decades is evidenced by growing rates of investment in research and development by firms—a popular indicator of specificity since it captures the emphasis placed by firms on developing their own technologies (Acs and Isberg 1991). Spending by U.S. manufacturing companies on R&D rose from about 0.5% of sales in 1950 to over 3% in 1990 (see U.S. Department of Commerce, Statistical Abstract of the United States, various years).

<sup>&</sup>lt;sup>20</sup> Goldin (1990, 115) has argued that, by the turn of the century, the market for labor in the manufacturing sector was essentially a spot market, with most jobs easily handled by the average worker. See also Gordon, Edwards, and Reich (1982, 112–28).

<sup>21</sup> While the evidence that scale economies alone act as powerful barriers to entry in practice is not strong (Scherer 1980), there is more evidence that larger capital requirements mean that fewer individuals or groups can secure the funding needed for entry (Geroski and Jacquemin 1985). Strategic considerations also tend to inhibit exit when scale economies are large (Ghemawat and Nalebuff 1990).

<sup>&</sup>lt;sup>22</sup> For simplicity, levels of mobility are treated as general to all factors here. One might prefer to differentiate measures of mobility for each factor, but the evidence indicates that technological forces have affected levels of mobility in a very similar fashion for all factors. From Figures 1 and 2 it does seem that levels of interindustry capital mobility may have peaked earlier than levels of labor mobility, and one might thus anticipate that industry-based schisms among owners of capital would predate similar divisions among workers late in the nineteenth century. For an extended formal treatment of the consequences of allowing different rates of change in capital and labor mobility, see Hiscox 1997.

Regional divisions began to yield to a growing class cleavage that separated landowners (especially in the South and West) from urban interests and helped to generate the Granger and Populist movements.<sup>23</sup> At the height of the conflict, the Republican tariff of 1890 was denounced as the "culminating atrocity of class legislation" in the Democratic party platform, and the two parties squared off on the trade issue at each election. Growing rifts over the trade issue within the parties became more apparent in the 1920s and 1930s, however, and by the 1960s there were deep divisions in both parties and in the peak associations representing labor, business, and rural classes (Destler 1992, 176-77; Turner and Schneier 1970, 71).<sup>24</sup> Meanwhile, lobbying by industry groups appeared to intensify (on both sides of the trade issue) and played a key role in shaping policy outcomes (Baldwin 1985; Destler 1992, 189-96; Lavergne 1983).25

#### **Congressional Voting**

We can better assess temporal changes in coalition patterns (and the relative utility of class and group-based models) by examining congressional votes on major pieces of trade legislation in different historical periods. The presumption here is that legislators' voting decisions reflect their response to pressures from societal coalitions. If the theory is correct, voting decisions should more clearly reflect legislators' responses to demands by broad factor classes when levels of interindustry factor mobility are relatively high and demands from protectionist and free-trade industries within their districts when mobility levels are relatively low.

A number of studies of congressional votes on trade policy have appeared in the literature to date. Most of these have been limited to examining a specific piece of legislation, usually in recent years (see Baldwin and Magee 2000). They include studies of votes on automobile domestic content legislation in 1982 (Coughlin 1985; McArthur and Marks 1988), the Trade Act of 1974 (Baldwin 1985), textile quota legislation in 1985 (Tosini and Tower 1987), the Export Facilitation Act of 1987 (Uri and Mixon 1992), and the omnibus trade legislation of 1987 (Marks 1993). The votes on the NAFTA have been given special attention in recent work (Baldwin and Magee 2000; Holian, Krebs, and Walsh 1997; Kahane 1996; Steagall and Jennings 1996;

Uslaner 1998). Conybeare (1991) looks at votes in earlier times, and Gilligan (1997) provides an excellent analysis that covers 12 bills in Congress between 1890 and 1988.

The findings from these studies shed some light on the coalitions issue, but only indirectly. In analyses of recent trade votes, measures of the importance of import-competing industries in districts have significant, positive effects on the likelihood that legislators vote in favor of protection. Dependence on export industries in electoral districts, on the other hand, tends to raise the likelihood that legislators vote for liberalizing bills. These relationships, which fit well with the industry-based approach to trade politics, appear much less clear in the studies of earlier votes: Conybeare (1991) finds evidence of industry effects, but Gilligan (1997) indicates that such effects are quite weak. Evidence on the importance of factoral or class variables is even less clear. Recent studies have indicated that votes against NAFTA in 1993 were positively associated with the degree to which legislators relied upon campaign contributions from labor political action committees (Baldwin and Magee 2000; Steagall and Jennings 1996). But it is difficult to draw clear inferences from this without knowing the extent of the bias in the industry composition of contributing labor groups-laborintensive import-competing industries tend to be more unionized and, thus, are likely to be the primary source of contributions.

To compare the relative utility of class and industry-group models, I take a simple approach here, relating voting patterns among members of the Senate and House over time to measures of the class and industry makeup of their constituencies. The dependent variable is the legislator's vote for protection (1 = for a protectionist bill or against a liberalizing bill, 0 = against a protectionist bill or for a liberalizing bill). Votes on 30 major pieces of trade legislation between 1824 and 1994 are examined (Appendix B provides a detailed list of these bills).

The explanatory variables are measures of the class or industry characteristics of each state in each year in which a vote was taken. For factor classes, I derived several measures from the available census data.<sup>27</sup> As a basic measure of the importance of farmers in each state, I have used the total value of agricultural production as a fraction of state income. As a measure of the importance of labor, I used total employment in manufacturing as a proportion of each state's population. Measuring the importance of capital poses somewhat greater problems, since the census data on capital

<sup>&</sup>lt;sup>23</sup> As one simple indicator of the trend, the proportion of states in which two senators split their votes on trade legislation rose from 0.09 in the final votes on the Tariff Act of 1824 to 0.22 in votes on the Tariff Act of 1842 and 0.32 for the Trade Act of 1875. Meanwhile the average party cohesion (Rice indexes) for votes on major trade bills in the House rose from 2.8% in 1824, to 44.1% in 1842, and to 66.1% in 1875. Later votes became even more polarized along partisan lines as Republicans and Democrats went head to head: average cohesion registered 98.7 (in 1890), 90.2 (1894), 98.0 (1897), 97.4 (1909), and 94.3 (1913). See Appendix B for the full list of tariff bills.

<sup>&</sup>lt;sup>24</sup> Average party cohesion indexes for House votes on major trade bills were only 43.9 (in 1955), 43.3 (1962), 36.3 (1974), 33.0 (1993), and 33.0 (1994). See Appendix B for the full list of tariff bills.

<sup>&</sup>lt;sup>25</sup> Destler and Odell (1987) document a marked rise in political activity among both groups opposed to and groups supporting product-specific trade protection in the 1970s and 1980s.

<sup>&</sup>lt;sup>26</sup> All models are estimated using probit in STATA 7.0.

<sup>&</sup>lt;sup>27</sup> The state data on factors are drawn from decennial censuses (prior to 1919) and the U.S. Department of Commerce's Census of Manufactures, Census of Agriculture, and Census of Mining (afterward) for years closest to the years in which each vote was taken. For years prior to 1840 the state data are extrapolated from the time series on later observations. State income data are from the U.S. Department of Commerce, Bureau of the Census (1989), State Personal Income (various years), and Kuznets et al. (1960). State population data are from the U.S. Department of Commerce, Bureau of the Census, Statistical Abstract of the United States.

invested in manufacturing industries ends in 1919. Using total manufacturing production in each state is one possible approach, but this does not permit distinctions between the amounts of capital and labor engaged in production. Instead I used profits earned by capital in manufacturing (measured as value-added minus wage payments) as a fraction of the state income, on the assumption that these profits vary from state to state largely as a function of the total magnitude of investments.<sup>28</sup> To measure the industry characteristics of each state I examined the size of the leading exporting and import-competing industries in each state using data on trade from the Department of Commerce and census data on production in manufacturing, mining, and agricultural sectors. For each state I calculated total production in the 10 leading exporting and importcompeting industries in each year as a proportion of the state income.<sup>29</sup>

The analysis includes dummy variables for each bill, to account for individual characteristics of particular bills (or years) when examining votes in favor of protection.<sup>30</sup> On the other hand, I have not included controls for the party affiliations and regional locations of members of Congress, even though previous work indicates that both types of variables have been good predictors of voting patterns on trade at different times. I exclude them here to provide the clearest imaginable test between the class and the industrygroup models. Party affiliations and regional locations are both strongly correlated with the measures of the class and industry characteristics of states at different levels in different periods. This in unsurprising: The competing parties have appealed to very different classbased constituencies over the years and to supporters in different geographical regions, and those regions themselves have often displayed marked differences in their economic composition in terms of both factor classes and trade-affected industries (see Kim 1998). In the antebellum years, for instance, the Jackson Democrats in Congress were elected mainly from Southern states

in which farming outweighed manufacturing interests and exporting industries were far larger than import-competing concerns. My main concern here is not to muddy the water when comparing the performance of the class and group-based models by inadvertently including class effects in the group-based model, or vice versa.

I have divided the main analysis into five parts, pooling the votes taken in five historical periods: 1824–60, 1875–1913, 1922–37, 1945–62, and 1970-94. The aim is simply to provide some clear comparisons over time. The estimations of each model have also been performed on a bill-by-bill basis and the conclusions are substantively identical to those reported below. The class and industry models are estimated separately, and their performance in different periods is then compared and evaluated using Davidson and MacKinnon's (1981) *J* test. The class are estimated using Davidson and MacKinnon's (1981) and their performance in different periods is then compared and evaluated using Davidson and MacKinnon's (1981) are the class are estimated using Davidson and MacKinnon's (1981) are the class are estimated using Davidson and MacKinnon's (1981) are the class are estimated using Davidson and MacKinnon's (1981) are the class are estimated using Davidson and MacKinnon's (1981) are the class are estimated using Davidson and MacKinnon's (1981) are the class are estimated using Davidson and MacKinnon's (1981) are the class are estimated using Davidson and MacKinnon's (1981) are the class are estimated using Davidson and MacKinnon's (1981) are the class are estimated using Davidson and MacKinnon's (1981) are the class are estimated using Davidson and MacKinnon's (1981) are the class are estimated using Davidson and MacKinnon's (1981) are the class are estimated using Davidson and MacKinnon's (1981) are the class are estimated using Davidson and MacKinnon's (1981) are the class are estimated using Davidson and MacKinnon's (1981) are the class are estimated using Davidson and MacKinnon's (1981) are the class are estimated using Davidson are the class 
The "class model" includes the three indicators of the importance of different factor classes in each state: the value of agricultural production, employment in manufacturing, and profits earned by capital in manufacturing. According to the basic class-based approach, we should expect that the value of farm production is negatively related to votes for protection over the entire time span, since the U.S. economy has been relatively well endowed with land, compared to other nations, and owners of land should thus have favored freer trade (in accord with the Stolper-Samuelson model).34 Owners of labor, on the other hand, should have favored protection, since the economy has been relatively poorly endowed with labor compared with its trading partners, and thus employment in manufacturing in states should be positively related to votes for protection. And, finally, according to Rogowski (1989, 29), the United States is properly regarded as a capital-scarce economy for most of the period prior to 1914, transforming into a capital-abundant economy sometime before the First World War. We should thus expect a change in the policy preferences of owners of capital sometime between the second and the third periods examined here (or perhaps even earlier), with a shift away from support for protection. In terms of the estimated effects, that means that total profits earned by capital in each state

<sup>&</sup>lt;sup>28</sup> The measure is strongly correlated (at 0.92) with the total capital invested as a fraction of the state income for the period (1840–1919) for which data on the latter are available. I have performed the analysis using a range of alternative measures of the class variables, including the total value of land in agriculture and total land area (for farmers), aggregate wages in manufacturing (for labor), and total manufacturing production and production per worker (for capital). The key results, discussed in the next section, are substantively identical regardless of which combination of measures is employed.

<sup>&</sup>lt;sup>29</sup> The 10 leading exporting and import-competing industries in each year in which a vote occurred were identified using figures for exports and imports drawn from the U.S. Department of Commerce's Commerce and Navigation of the United States. This approach follows that used by Gilligan (1997), though the set of votes/years differs in that my analysis includes the antebellum period as well as many bills after 1870 that have been excluded from previous studies. The full lists if the top 10 export and import-competing industries in each year are available from the author.

<sup>&</sup>lt;sup>30</sup> I have also examined specifications of each model that include variables such as dummies for bills with provisions delegating authority to the president to negotiate tariff reductions with other nations and for bills that ratified trade treaties already negotiated. The key substantive results are identical to the ones reported below so the simplest specifications have been presented.

<sup>&</sup>lt;sup>31</sup> The division of the post-1945 period just recognizes that U.S. trade patterns were quite volatile in the immediate postwar period, as the European and Japanese economies were rebuilding, and (not coincidentally) the two political parties switched sides on the trade issue in the 1960s.

in the 1960s.

32 Note that since some members of Congress vote on more than one bill in each of the pools considered, all observations are not independent and so the estimated standard errors are biased in a downward direction in that analysis. I am grateful to an anonymous reviewer for making this point. Results for the bill-by-bill analysis are available from the author.

<sup>&</sup>lt;sup>33</sup> The various class and industry variables are collinear in ways and degrees that differ over time, so including them all in one estimation would actually make it very difficult to interpret the size and significance of their competing effects on voting.

<sup>&</sup>lt;sup>34</sup> See Rogowski (1989) for quantitative evidence on U.S. factor endowments, with deductions about class preferences on trade derived from the Stolper–Samuelson theorem. Rogowski's designations are applied here.

should be positively associated with votes for protection in the first period and most of the second period and negatively thereafter.

Table 1 reports two sets of results. On the left are the estimated coefficients and pseudo-R2 statistics from the probit estimations of the class model in each period, which can be compared (see Table 5 below) with the results from the alternative industry-group model. On the right, to give some idea of the magnitude of the different effects, are the first differences in the probability of voting for protection when each of the class variables changes from its theoretical minimum to its theoretical maximum value (from 0 to 1). Interpreting the estimated coefficients in the full model (on the left) is rather difficult here because employment and profits in manufacturing are so highly collinear across states (they are correlated at about 0.7 in each period). Both directly reflect the size of the manufacturing sector in each state and the separate effects of the different class variables are thus difficult to discern.35 An interesting part of the problem here is that when both employment and profits are included in the one model, the estimated coefficients will also measure the effects of variation in labor and capital intensities in manufacturing production (using more labor with the same amount of capital, and vice versa). As a partial corrective here I have simply calculated the first differences for each variable (on the right) when other class variables are excluded from the model. The separate effects are less important, in the end, than the overall performance of the class model in each period and how it compares with the industry-group model, so this is not a crucial issue.

The value of farm production is negatively associated with votes for protection, as anticipated, in all but the fourth period. The votes taken in the immediate post-1945 years may be anomalous in this regard due to the new rural reliance on farm support programs introduced in the 1930s. The estimated effects of farming on votes (shown on the right) are smallest in the first and last periods; the largest negative effects appear in the periods between 1875 and 1937. Manufacturing employment is positively associated with protectionist votes, as expected, although the results are again less clear between 1945 and 1962, the postwar boom period for all kinds of U.S. manufacturing exports. While the class model anticipates that owners of capital favored protection up until at least 1914, the coefficients for the profits variable in the first three periods are negative. Since employment and profits are highly collinear, however, this may simply indicate that highly capitalintensive producers were less supportive of protection than others. The effects of profits on votes, calculated with employment excluded from the estimation (on the right), are positive until 1937, and largest between 1875 and 1937, as are the effects of employment on votes.36

Table 2 presents the results of estimations for the same set of votes on trade legislation in the Senate, but now using indicators of the importance of exporting and import-competing industries in each state as the explanatory variables. In line with a simple industry-group model, we anticipate that the importance of

<sup>&</sup>lt;sup>55</sup> For a discussion, see Gujarati 1995, 327–35. The problem is not just inefficiency, though the standard errors for the estimates more than double when all three variables are included in the model rather than one alone. It is also a question of effective sample size: There are hardly any observations, for instance, in which state employment in manufacturing is high while state profits in manufacturing are low (or vice versa).

<sup>&</sup>lt;sup>36</sup> I have tried variants of the basic class model for the recent periods that include measures of the skill level of the workforce in each state assuming, in line with Midford (1993) and Scheve and Slaughter (1998, 2000), that skilled workers, viewed as a separate class, oppose protection. Yet models that include measures of the proportion of the state's adult population with high school diplomas or higher levels of education perform no better than the basic specification in Table 1. In none of the estimations are the coefficients on these variables significant, and often they take the wrong (positive) sign. Since such data are unavailable for previous periods, I have reported only the simplest model here to provide straightforward comparisons over time.

exporting industries should be negatively related to votes for protection, since individuals employed or invested in those industries benefit from trade liberalization, while the importance of import-competing industries should be positively related to votes for protection.

As expected, in each period the estimated coefficients for the exporting industries variable are negative, and the coefficients for import-competing industries are positive. Again, we must exercise care here in interpreting the size and significance of the separate effects, since these two variables appear quite collinear across states in early periods. Again (on the right), I simply calculated the first difference effects on the probability of voting for protection for a change in each variable from its theoretical minimum to its theoretical maximum (0 to 1) when excluding the other industry variable from the estimation. Here the pattern in the size of effects over time is the reverse of that for the class variables: Both industry variables have larger effects on voting in the first and last period and smaller effects on votes in between.

Overall, the results of the analysis of the Senate votes are quite consistent with expectations based upon changes in factor mobility over time. Voting decisions more closely reflect Senator's consideration of the interests of broad factor classes when levels of mobility were higher (in the years between 1875 and 1937) than when mobility levels were lower (in the periods between 1824 and 1860 and from 1945 to the 1990s). The pattern works just the other way when we examine the responsiveness of Senate voting to demands from free-trade and protectionist industries within each state.

Tables 3 and 4 report the results of the analysis of House votes for each model. These must be treated with a little more caution since the measures of the importance of classes and industries are available only at the state level, rather than the district level, and so we are relying on an assumption that the class and industry composition of districts within states are similar.

The results are very similar to those obtained from the analysis of Senate votes. The estimated coefficients are comparable for each class and industry variable

in each period. The only clear difference is that the estimated effects of employment and profits on voting in the immediate postwar years, between 1945 and 1962, are positive rather than negative (Table 3), suggesting that members of the House from states heavily dependent on manufacturing did not switch positions on trade as quickly after the war as senators. Again, the estimated effects for the maximum possible change in each of the class variables are largest in the second and third periods, between 1875 and 1937. And again, the estimated effects of changes in each of the industry variables indicate a complementary result: They are largest in the earliest and latest periods and smaller in the periods in between.

A simple way to gain a better sense of the relative utility of the class and industry models involves a comparison of the pseudo-R<sup>2</sup> values in each period (see Table 5). For votes in both the Senate and the House the pattern is the same: The class model performs much better than the industry model in periods two through four, while performing far worse than the industry model in periods one and five.

Table 5 also reports the results of formal tests to discriminate between the two competing models. Davidson and MacKinnon's (1981) "J test" is used to assess H<sub>0</sub> (the class model is appropriate) against H<sub>1</sub> (the industry model is appropriate) by an indirect linear combination of the two models. The test is conducted by estimating a combination of the class model and the predicted values from the industry model, where  $\alpha_i$  is the weight on the industry model. If H<sub>0</sub> is true, then the true value of  $\alpha_i$  is zero. We can then test for  $\alpha_i = 0$ to judge whether H<sub>0</sub> can be rejected. The procedure is simply reversed to test for whether H<sub>1</sub> can be rejected. Clearly the industry model dominates the class model in periods one and five, in both the Senate and House; the class model dominates the industry model in period two in both chambers; while a clear winner (or loser) does not emerge in periods three and four. The votes in period four, between 1945 and 1962, seem especially difficult for the models: While the class model appears to explain more of the variation in both the Senate and the House votes, the effects of two of the three class variables (farming production and profits in manufacturing) actually go counter to the direction anticipated in standard class-based accounts.

It should be clear that these cross-time comparisons provide only an indirect test of the factor mobility hypothesis. We are tightly constrained by the availability of data. If we had data on levels of factor mobility by electoral district for a substantial period of history, so that we could allow for spatial differences in mobility levels as well as temporal ones, we could do much more with the analysis of roll call votes and test the theory more directly. But the data on general levels of mobility reported in Figures 1 and 2 represent the first systematic measurement of interindustry factor mobility over any span of time in the literature—an astounding fact given the centrality of mobility (and its converse, specificity) in theories of political economy. It is enough to provide us with a set of basic predictions about how the relative utility of the class and group-based models should fluctuate over time. That these predictions are confirmed by the analysis of congressional voting patterns strongly suggests that further analysis of factor mobility holds real promise for helping to bridge the large gulf that exists between competing theoretical models currently used in political economy.

#### CONCLUSIONS

While the possibility of relating variation in factor mobility to variation in coalitions has been discussed by a number of scholars in the past (see Alt et al. 1996; Magee 1980), no systematic empirical study of the relationship has been furnished to date. The evidence presented here suggests that mobility levels in the United States have varied markedly with different stages of industrialization over the last two centuries. These changes coincided with significant shifts in trade politics: Voting decisions in both the Senate and the House more clearly reflected class-based considerations when interindustry mobility was relatively high but were more in line with industry-based pressures when mobility was relatively low.

These results do not, of course, approximate the final word on the matter. Using legislative votes as the dependent variable here has the advantage that it is "where the action is" when it comes to the making of trade policy, but it is at least one step removed from the social cleavages and coalitions that are at issue. Alternative evidence should be considered. One possibility involves the use of data from public opinion surveys to measure the policy preferences of individuals. In recent work, Scheve and Slaughter (1998, 2001) have examined responses to a question about the desirability of new limits on imported goods included in

National Election Studies surveys in 1992 and 1996, relating them to the occupational characteristics of respondents.<sup>37</sup> They conclude that a basic class characteristic of respondents (their skill level) was a better predictor of their opinions on trade policy than the competitive position of the industry in which they were employed, a conclusion that runs counter to the results from the analysis of recent congressional trade votes reported above.<sup>38</sup> Pursuing this type of evidence further, and the apparent disjuncture between public attitudes and congressional politics, might be extremely fruitful, although reliable survey data are available only for very recent years.39

More work on the issue is clearly warranted. But the findings reported here do suggest a relatively simple solution to the persisting division in the scholarly literature between class and group-based models. Both types of approaches can be justified under different conditions. For the study of political economy more generally the findings have some wide-ranging implications. Depending upon the assumptions one makes about levels of interindustry mobility, general equilibrium models produce very different predictions about the distributional implications of any policy that affects relative commodity prices, and thus the demand for different factors of production, and any policy that affects the supply of those different factors. The distributional effects of a vast range of policies thus hinge upon levels of mobility: exchange-rate policy, controls on foreign investment (both outward and inward), all forms of industrial policy and industry regulation (subsidies, tax incentives, and labor and environmental laws), and immigration policy. The extent to which these policy issues generate class conflict, rather than industry-based rent-seeking, will hinge critically upon levels of factor mobility in the economy.

There are important implications, too, for the direction of U.S. trade policy. When levels of interindustry mobility decline, as in recent years, the evidence suggests that policymakers will have less incentive to stake out a coherent free trade (or protectionist) position on trade, aimed at capturing support from a broad class-based coalition, and instead they will be more inclined to adopt incoherent policy positions that balance competing demands from the most powerful industry

<sup>&</sup>lt;sup>37</sup> Gabel (1998) has employed data on public support for European Union membership from recent Eurobarometer surveys in a similar

fashion.

38 Interestingly, however, Scheve and Slaughter have also found that respondents in counties in which import-competing industries accounted for larger shares of employment tended to have more protectionist views. This seems like a reasonable confirmation of the strength of industry-based coalitions, although they argue that it reflects calculations the respondents are making about the effects of international trade on housing values in the counties.

Much also appears to depend on the wording of the particular survey question examined and the context in which it has been posed. Bauer, Pool, and Dexter (1972, 81-84) argue forcefully that public attitudes toward the trade issue are especially poorly informed and unstable, changing drastically in accord with small changes in the wording of questions. Context may also be critical. In 1992 and 1996, for instance, survey responses are likely to have hinged upon attitudes toward NAFTA that had some very particular characteristics (e.g., the potential effects on foreign direct investment).

groups on both sides—supporting multilateral trade negotiations with one hand, for instance, while generously applying nontariff barriers to imports in key sectors with the other. If mobility levels continue to decline, this raises the specter of a kind of Olsonian nightmare in which a growing share of the economy's resources are squandered on zero-sum distributive battles instead of being invested in productive activities (Bhagwati 1982; Olson 1982).

Class-based political battles are no picnic, of course. They can be a tumultuous and disruptive force, producing sharp fluctuations in policy as first one side, then another, gains control of government. But broadbased class coalitions are also more encompassing of society as a whole, as Olson (1982) famously noted, and thus more interested in policies that expand the size of the national "pie" rather than simply divide it. Establishing some kind of stable compromise between broad class coalitions along Swedish lines is an obvious solution, providing for efficiency-enhancing types of economic policies and methods of compensation. But maintaining such a broad-based compromise requires programs that discourage industry rent-seeking by supporting and promoting high levels of interindustry mobility among owners of labor and capital. In the end, a strong case may thus emerge for more extensive forms of adjustment assistance to workers and firms that would enable them to respond to changes in the international economy in more efficient, nonpolitical wavs.

#### APPENDIX A. A MODEL OF THE INCOME EFFECTS OF TRADE WITH VARIABLE FACTOR MOBILITY

The model developed here builds upon Jones's (1971) three-factor model. It is a modified version of the traditional,  $2 \times 2$  general-equilibrium model used in the trade literature. Consider an economy in which two commodities,  $X_1$  and  $X_2$ , are produced, and sector i uses only factors specific to it,  $L_i$  and  $K_i$ . Since only relative prices matter in this two-commodity model,  $X_1$  is chosen as the *numeraire* for the analysis. Equilibrium is described by full employment of each factor (Equations 1 to 4) and competitive profits (Equations 5 and 6):

$$a_{L11}X_1 = L_1, (1)$$

$$a_{K11}X_1 = K_1, (2)$$

$$a_{122}X_2 = L_2, (3)$$

$$a_{K22}X_2 = K_2,$$
 (4)

$$a_{L11}w_1 + a_{K11}r_1 = 1, (5)$$

$$a_{L22}w_2 + a_{K22}r_2 = p, (6)$$

where  $a_{Lij}$  and  $a_{Kij}$  are the quantities of  $L_i$  and  $K_i$  required per unit output of  $X_j$ ,  $w_j$  and  $r_j$  are returns to labor and capital in industry j in terms of the first commodity, and p is the relative price of the second commodity in terms of the first. Full employment requires that techniques of production are variable, and since competition ensures that unit costs are minimized, each  $a_{ij}$  depends upon the ratio of factor prices in industry  $j: a_{ij} = a_{ij}(w_1/r_j)$ .

Solving Equations 1 and 2 for  $X_1$ , and Equations 3 and 4 for  $X_2$  yields:

$$\frac{a_{L11}}{a_{K11}}K_1=L_1, (7)$$

$$\frac{a_{122}}{a_{K22}}K_2 = L_2. {8}$$

Equations 5 to 8 provide a set of four relationships in the four unknown factor prices. Commodity prices are exogenous, and for the moment, endowments of specific factors are treated as parameters. The structure of the model is best examined by describing the manner in which the equilibrium is disturbed by changes in commodity prices. After differentiating totally, we can solve for the percentage change in each of the factor returns (results are stated in percentage terms to indicate, not only directions, but relative magnitudes of changes).

$$\frac{dw_1}{w_1} = -\frac{\theta_{K11}}{\sigma_1} \left( \frac{dL_1}{L_1} - \frac{dK_1}{K_1} \right), \tag{9}$$

$$\frac{dr_1}{r_1} = \frac{\theta_{L11}}{\sigma_1} \left( \frac{dL_1}{L_1} - \frac{dK_1}{K_1} \right), \tag{10}$$

$$\frac{dw_2}{w_2} = \frac{dp}{p} - \frac{\theta_{K22}}{\sigma_2} \left( \frac{dL_2}{L_2} - \frac{dK_2}{K_2} \right), \tag{11}$$

$$\frac{dr_2}{r_2} = \frac{dp}{p} + \frac{\theta_{L22}}{\sigma_2} \left( \frac{dL_2}{L_2} - \frac{dK_2}{K_2} \right), \tag{12}$$

where  $\sigma_j$  is the elasticity of substitution between labor and capital in industry j,  $\theta_{Lij}$  and  $\theta_{Kij}$  are the distributive shares of factor i in the value of output of industry j, and we have utilized the relation

$$\theta_{Lij}\left(\frac{da_{Lij}}{a_{Li}}\right) + \theta_{Kij}\left(\frac{da_{Kij}}{a_{Kij}}\right) = 0,$$

which is implied by the cost-minimizing choice of  $a_{ij}$  (Jones 1971, 6).

To analyze the effects of factor mobility we can consider each of the specific factors to be themselves outputs of productive processes whereby  $L_1$  can be converted into  $L_2$  and  $K_1$  into  $K_2$  at increasing opportunity costs. Total factor endowments, L and K, are fixed exogenously (where  $L = L_1 + L_2$  and  $K = K_1 + K_2$ ), but the ratios  $L_2/L_1$  and  $K_2/K_1$  respond positively to relative returns,  $w_2/w_1$  and  $r_2/r_1$ , respectively. Mobility is then defined interms of the elasticities of substitution,  $\phi_L$  and  $\phi_K$ , along the transformation loci connecting  $L_2$  and  $L_1$  and connecting  $K_2$  and  $K_1$ , respectively.

$$\phi_L = \frac{d(L_2/L_1)/(L_2/L_1)}{d(w_2/w_1)/(w_2/w_1)},$$
 and also,

$$\phi_K = \frac{d(K_2/K_1)/(K_2/K_1)}{d(r_2/r_1)/(r_2/r_1)},$$

where  $\phi_L$ ,  $\phi_K \geq 0$ .

These relationships can be used with Equations 9 to 12 to derive full solutions for the percentage change in factor returns as a function of the percentage change in commodity prices ("hats" indicate percentage changes):

$$\hat{w}_1 = \left[ \frac{-\theta_{K11}\sigma_2(\phi_K \tau_{K2} - \phi_L \tau_{L2}) - \theta_{K11}\phi_L \phi_K \Omega}{\Delta} \right] \hat{p}, \tag{13}$$

$$\hat{r}_1 = \left[ \frac{\theta_{L11}\sigma_2(\phi_K \tau_{K2} - \phi_L \tau_{L2}) + \theta_{L11}\phi_L \phi_K \Omega}{\Delta} \right] \hat{p}, \tag{14}$$

$$\hat{w}_{2} = \left[ \frac{-\theta_{K11}\sigma_{2}(\phi_{K}\tau_{K2} - \phi_{L}\tau_{I2}) + \phi_{K}(\sigma_{1}\tau_{K1} + \sigma_{2}\tau_{K2}) + \sigma_{1}\sigma_{2} - \theta_{K11}\phi_{L}\phi_{K}\Omega}{\Delta} \right] \hat{p},$$
(15)

$$\hat{r}_2 = \left[ \frac{\theta_{L11}\sigma_2(\phi_K\tau_{K2} - \phi_L\tau_{L2}) + \phi_L(\sigma_1\tau_{L1} + \sigma_2\tau_{L2}) + \sigma_1\sigma_2 + \theta_{L11}\phi_L\phi_K\Omega}{\Delta} \right] \hat{p}, \tag{16}$$

where  $\Delta = \phi_L(\theta_{K22}\sigma_1\tau_{L1} + \theta_{K11}\sigma_2\tau_{L2}) + \phi_K(\theta_{L22}\sigma_1\tau_{K1} + \theta_{L11}\sigma_2\tau_{K2}) + \sigma_1\sigma_2 + (\theta_{L11} - \theta_{L22})\phi_L\phi_K\Omega > 0$ ,

 $\Omega = \tau_{L1}\tau_{K2} - \tau_{I2}\tau_{K1},$ 

where  $\tau_{L_J}$  and  $\tau_{K_J}$  are the fractions of total labor and capital employed in industry j.  $\Omega$  describes factor intensities: It is positive (negative) when production of  $X_1$  is relatively labor (capital)-intensive.

Equations 13–16 show that the relationships between p and factor returns depend on the levels of labor and capital mobility. The Ricardo-Viner and Stolper-Samuelson results appear here as special cases. If we assume that capital is completely specific, as in the standard Ricardo-Viner derivation,  $\phi_K = 0$  and the solutions yield the standard results. Specifically, if p rises  $(\hat{p} > 0)$ , both wage rates also rise but at a slower rate:  $\hat{p} > \hat{w}_2 > \hat{w}_1 > 0$ . (Note that  $\hat{w}_2$  approximates  $\hat{w}_1$  as  $\phi_L$ rises.) Further, the return on capital in the second industry increases at a faster rate than p, while in the first industry it falls:  $\hat{r}_2 > \hat{p} > 0 > \hat{r}_1$ . If we assume that labor and capital are infinitely mobile, as in the Stolper-Samuelson approach,  $\phi_L = \phi_K = \infty$  and the model yields the familiar outcome: An increase in the relative price of the labor(capital)-intensive commodity produces a larger rise in wage rates (profits) and a decline in profits (wages). Specifically, if p rises,  $\hat{w}_2$  and  $\hat{w}_1$ are greater than  $\hat{p}$  (<0), and  $\hat{r}_2$  and  $\hat{r}_1$  are negative (> $\hat{p}$ ), if and only if  $\Omega < (>)0$ .

The key relationship that concerns us here describes how the mobility of a factor influences class solidarity, as indicated by the difference between the effects of a price change on returns to the factor in each industry. For any change in p, the absolute difference between  $\hat{w}_1$  and  $\hat{w}_2$  is inversely related to  $\phi_L$ ; that is,  $\partial(|\hat{w}_1 - \hat{w}_2|)/\partial\phi_L < 0$ . Likewise, the absolute difference between  $\hat{r}_1$  and  $\hat{r}_2$  is inversely related to  $\phi_K$ ; that is,  $\partial(|\hat{r}_1 - \hat{r}_2|)/\partial\phi_K < 0$ . The implication is that, for any change in relative prices induced by a shift in trade policy or trade flows, the income effects for workers (capitalists) in different industries will be more similar when labor (capital) mobility is higher, all else equal.

## APPENDIX B. CONGRESSIONAL VOTES ON TRADE LEGISLATION

The full list of trade bills included for the House and Senate and how they have been coded is given in Table A1. I selected major pieces of legislation that directly raised or lowered barriers to imports. Approximately two bills for each decade were selected, for a total of 30 altogether. I excluded product-specific legislation (e.g., the 1988 Textile and Apparel Act) on the grounds that voting decisions on such bills are less representative of preferences with regard to the trade issue in general and are also more prone to logrolling. I also

excluded bills that were unclear or controversial in nature and difficult to interpret as either protectionist or liberalizing. The 1870 and 1872 Tariff Acts and the 1883 "Mongrel Tariff," in which Republicans cut some duties in response to surplus revenues with the aim of defending protection generally, are prime examples (Taussig 1931, 178-89, 232-50). The omnibus trade legislation voted upon between 1986 and 1988, to which was attached a wide array of non-trade-related provisions, is another. I included the protectionist Trade Remedies Reform Act of 1984 rather than the omnibus Trade and Tariff Act of the same year, into which it was ultimately incorporated, since the latter contained a mixture of liberal and protectionist measures. Finally, I excluded some rare "hurrah" votes, on the 1979 Trade Agreements Act that implemented the Tokyo Round agreement, the 1988 Canada-Û.S. Free Trade Agreement, and the Senate vote on the 1974 Trade Act, on the grounds that there is almost no variation in the dependent variable.

Several other general pieces of trade legislation might have been included. The protectionist tariff bill of 1820 was excluded in favor of the more famous 1824 Tariff Act. Ratification votes on reciprocity treaties with Canada in 1854 and 1910, and the 1864 resolution to abrogate the former of these, were excluded since their impact was limited to a narrow range of imported raw materials. The 1877 Mills Resolution that the tariff should be used only for revenue purposes was excluded since 146 representatives did not cast a vote. The 1878 Wood bill to reduce duties on manufactures was more important, but it was defeated by a motion to strike out the enacting clause in the House. The ill-fated Morrison bills of 1886 were excluded in favor of the more successful, and almost identical, 1884 bill. I included only two of the numerous post-1945 votes on RTA extension bills, excluding the votes of 1948, 1949, 1951, 1953, 1954, and 1958. The 1948, 1949, and 1951 votes are somewhat ambiguous in their liberalizing character since they introduced the "peril-point" and Escape Clause provisions designed to ensure that trade treaties would do no harm to domestic industries and thus were supported by many protectionists (Pastor 1980, 96). The 1987 Gephardt Amendment to the omnibus trade bill of that year, requiring action against nations running large trade deficits with the United States, might have been included, although in political substance it approximates the 1984 Trade Remedies Reform bill that made the list. The 1993 vote to extend the president's authority to complete the Uruguay Round of GATT negotiations was excluded to make way for the 1994 vote to implement the actual agreement.

Most of the coding decisions were straightforward. The "Adams Compromise" act of 1832 is coded protectionist, in accord with Taussig's (1931, 109-10) interpretation, since while it did cut revenue duties and remove the "minimums" system, it retained all of the protective duties of 1828 and was thus widely regarded as an endorsement of the "American system" of tariffs as permanent policy (Stanwood 1903, 383-86). The "Clay Compromise" of 1833, in contrast, provided for large (albeit gradual) cuts in protective duties. For the Tariff Act of 1857, I treated the House and Senate versions separately. In the House, the Campbell bill (known as the "manufacturers' bill") attempted to deal with the problem of surplus revenues by removing only duties on raw materials. In the Senate, the Democratic majority substituted Hunter's bill mandating cuts in protective duties. I also split the House and Senate bills of 1888: The Mills bill in the House proposed large tariff reductions, but the Senate revised it completely, formulating a protectionist bill that became the blueprint for the McKinley tariff of 1890.

For each bill the votes used in the analysis are those on final passage, since votes on amendments and procedural questions are more likely to be affected by idiosyncratic and strategic concerns. The source for all voting data was Rosenthal and Pool (2000).

#### **Political Theory**

Calhoun and Popular Rule: The Political Theory of the *Disquisition* and *Discourse*. By H. Lee Cheek, Jr. Columbia: University of Missouri Press, 2001. 202p. \$29.95.

Christopher M. Duncan, University of Dayton

C. S. Lewis claimed that he was a democrat because he believed in the fall of man. He went on to suggest that it was not that some men did not deserve to be slaves, but that none deserved to be masters. While not exactly the sort of uplifting proclamation that many partisans of democracy would hope to rally their followers around, it does provide those among us who are persuaded that human beings are limited in their capacities to reject vice and sin with an avenue and persuasive rationale to join their ranks. It is with this sort of view in mind that H. Lee Cheek, Jr.'s provocative and cogently argued book on the political thought of John C. Calhoun ought to be read.

Broadly speaking, Cheek engages in two general projects in this book. The first is an attempt to get Calhoun right, i.e., to understand him as he understood himself. The second project involves answering the larger question of whether the correctly defined Calhoun was, himself, right. This work succeeds admirably both in its provision of a sustainable interpretation of Calhoun's political theory and in its argument that much of what he theorized remains pertinent and useful. To those who believe that the term "Southern Democrat" is oxymoronic when applied to a supporter of slavery, the latter assertion will no doubt seem quite problematic. Cheek manages to disarm his potential critics, however, through what some may see as a slightly disingenuous strategy of at once narrowing his focus and generalizing his questions. Hence, we are asked to read the Disquisition and the Discourse closely and in the context of the South Atlantic republican tradition, but diverted from asking what the relationship between those works and defense of the South's peculiar institution might have been.

Indeed, slavery is barely mentioned, and in a footnote we are told that it is simply "beyond the scope of this book" (n. 37, p. 92). Though others may balk at this, I think that Cheek is on target when he asserts that "defending slavery was not the touchstone of Calhoun's thought" (p. 22) and, furthermore, that it is instructive to note along with him that readers as different and far removed from Calhoun as Stokely Carmichael sought out the *Disquisition* for theoretical guidance. Still, the question of linkage does remain begged.

That having been said about what the author does not attempt, there is much to be said in favor of what he does. According to Cheek, Calhoun's larger goal was to "reconcile the need for popular rule with the ethical preconditions for its survival" (p. ix). After a perfunctory but lucid account of the existing scholarship, Cheek embarks on his constructive project in the second chapter. There we are treated to a persuasive argument that places Calhoun's thought in a direct and quasi-apostolic relationship to the Jefferson of the Kentucky Resolutions and the Madison of the Virginia Resolutions and the Report of 1800. The case is made there that "for Jefferson, Madison, and Calhoun, only the states could adequately represent the people" and that "no other assemblage, and certainly not the population en masse, could represent the needs and diversity of Americans" (p. 56). Rather than the simplistic amalgamation of Calhoun's defense of states rights with a defense of slavery that is often performed by his less thoughtful critics, Cheek portrays it as the foundation of a larger political commitment to diffused power, legislative dominance, and the overall restraint in political life that is ultimately necessary for the preservation of liberty itself. As such, Cheek can assert without flinching that "Calhoun may be called the last of the founders" (p. 79). Though perhaps something of an overstatement, those who would reject the lineage or its basis would do well to remember exactly to whom the first 10 amendments to the Constitution were meant to apply.

Where Calhoun's thought departs from his predecessors is in his significantly deeper appreciation of the obstacles and limits to human perfection contained in our very nature. What many would refer to as the burden of original sin, Calhoun calls the "law of animated existence" (p. 100). That appreciation prods Calhoun to reject both libertarian individualism and political centralization as threats in their own right to a sustainable and ordered liberty. While Cheek ignores the obvious irony, he is on firm ground when he frames Calhoun's position as one designed to thwart majority tyranny and the dangers of unrestrained and nondeliberative "momentary electoral majorities" in an effort unite "constitutional and popular rule" (p. 113). What many may find discomforting is that at least one strong logical extension of that position is the claim of Calhoun's that "to accommodate the greatest amount of liberty, individuals and states must be allowed to pursue those avenues they may deem best to promote... interests and happiness" (p. 118).

The substantive chapter on the Discourse that follows only deepens that level of discomfort for opponents of states rights by asserting straightaway that when the Discourse is read properly and in light of the Disquisition, the conclusion that "the Tenth Amendment was a guide for defining the theoretical core of the republic" (p. 151) becomes all but inescapable. Now while I believe that the author does overestimate the continuity between the Articles of Confederation and the Constitution that is both asserted and implied by such an argument, the larger vision of both his and Calhoun's retains its consistency and integrity. Simply put, that larger vision forces Calhoun's detractors to explain how liberty, popular rule, community, and constitutionalism can all flourish simultaneously without a sustained commitment to the principle of subsidiarity and the diffusion of power. Neither the author nor his subject believes that you can, and both cases are persuasive.

In sum, this is a rich and well-argued book. It not only forces its thoughtful readers into a serious reconsideration about the political thought and theory of John C. Calhoun, but, at its best, forces them to reconsider the nature, purpose, and future prospects of the American regime. If the author is correct when he claims that Calhoun attempted to "locate the restorative features of the tradition within the original purity of the document [the Constitution]" (p. 166), then we must ask those who oppose his arguments, yet share his larger goals, where they would have us look.

If You're an Egalitarian, How Come You're So Rich? By G. A. Cohen. Cambridge, MA: Harvard University Press, 2000. 233p. \$35.00 cloth, \$18.00 paper.

Gillian Brock, The University of Auckland

In this work, G. A. Cohen presents his Gifford Lectures. He explains why he no longer believes in the inevitability of equality, why he rejects liberals' faith in the sufficiency of political recipes, and why he now believes "that a change in social ethos, a change in the attitudes people sustain toward each other in the thick of daily life, is necessary for producing equality" (p. 3). Both just rules and just personal choices are required for distributive justice. Good structural design is not

enough: You cannot change the world without changing the soul, as it were. He discusses how closely this aligns him with Christian views he once utterly disparaged.

The 10 chapters of the book are (mostly) so arranged as to explain the background to why he held the key views he did and why they have changed where they have. Autobiographical detail liberally intermingles with philosophical analysis. The autobiographical portions inform the philosophical analysis in ways rarely attempted in typical works of political philosophy, and the result is astonishingly successful.

Cohen starts off outlining (rather than resolving) some paradoxes of conviction. He moves on to a wonderfully candid discussion of his Montreal communist Jewish childhood and the political, religious, and antireligious views he once held. He then turns to discuss how classical Marxism was in the grip of the "obstetric conception of political practice" (p. 43) and why this dangerous idea should be rejected. If you hold the obstetric conception, you are more inclined to believe that solutions will simply appear and you do not expect to have to encounter hard choices in a way that responsible politics must. Moreover, obstetricism "appears to justify a criminal inattention to what one is trying to achieve, to the problem of socialist design" (p. 77). Cohen argues that recipes are essential not only so that it is clear what those in power are to do with power, but also so that the masses might have some reason to give them that power. So, rather than holding the obstetric view "according to which the baby is what the baby is, not what the midwife designs it to be" (p. 77), we should, at the very least, switch (and possibly mangle) metaphors, so that if we do not like the hot kitchen we are in, we start writing "recipes for future kitchens"

After an examination of Marx's view that religion is the opiate of the people, Cohen explains why equality is no longer inevitable. Marx believed that since the working class constituted the majority, produced the wealth, yet were exploited and needy, they would have nothing to lose from revolting. Cohen argues that this view is no longer sustainable because there is now no group within society of which all these features are true: There is no group on which society depends for production, that is exploited, constitutes a majority, and is in dire need. Furthermore, he is skeptical about creating proletarian solidarity across countries.

Equality is not inevitable, but we have ample reason to demand it, so the move to normative political philosophy is a wise one for a Marxist to make. There follows his engagement with leading American political philosophers, especially the work of John Rawls. He presses several criticisms of Rawls. It is important to note that he disagrees with Rawls on just how much inequality can be justified by the difference principle, and he takes issue with Rawls's view that the difference principle applies to the basic structure of society (which typically is taken to consist in society's major coercive social institutions). Cohen argues that there is no defensible account of what the basic structure is, such that principles which apply to it do not also apply to choices made within it. Rawls believes that the basic structure of society is the primary subject of justice because its effects are so profound and pervasive. Cohen argues that if these are the relevant grounds for identifying the primary subject of justice, the major coercive social institutions cannot be our only focus, as the example of the family makes clear. The major reason for caring about the basic structure that Rawls offers is also a reason for caring about the informal structure and personal choice within society. Moreover, there is ample scope for personal justice or injustice within a just structure. Securing distributive justice by purely structural means is impossible. A society committed to the difference principle would still need "an ethos which informs choice within just rules" (p. 132).

Finally, Cohen turns to the issue of whether rich (professed) egalitarians can really answer the question "If you're an egalitarian, how come you're so rich?" in any defensible ways, given the widespread inequality in the world today. He examines a number of justifications an egalitarian might offer for not giving away much personal wealth: giving wouldn't remove inequality of power or reduce division between people, giving would merely be a drop in the ocean, giving is a duty of the state not individuals, giving could disadvantage one's children relative to one's peers, and giving would involve a sharp reduction in standard of living, which would induce a strong sense of deprivation. His aim in the final chapter is simply to assemble reasons, and although he believes some reasons are good ones (for instance, something like the last two listed), he doesn't weigh up just how plausible on balance we should find these.

In this excellent book, Cohen has combined fascinating autobiography with rigorous theoretical analysis, often drawing on the details of his past to explain the importance of key shifts in his theoretical views. The result is a work that is both immensely enjoyable to read and a sophisticated contribution to Marxist theory, egalitarianism, and debates about what political philosophy should entail for personal behavior. In particular, his discussion on this last issue constitutes pioneering work in an area not yet claiming many political philosophers' attention (professionally, at any rate).

The Problems of Communitarian Politics: Unity and Conflict By Elizabeth Frazer. Oxford: Oxford University Press, 2000. 279p. \$70.00 cloth, \$24.95 paper.

Barbara Arneil, University of British Columbia

This book begins where The Politics of Community (1993), Elizabeth Frazer's previous book (coauthored with Nicola Lacey) left off. Having laid the groundwork for the analytical problems within both liberal and communitarian thought and proposed a new type of feminist communitarianism in the first book, Frazer turns her penetrating analytical mind in this book to considering in greater depth the nature of both communitarianism and community. Ironically, having spent so much time analyzing the community, Frazer's recommendation at the end of this book is to dispense with the term in many contexts in favor of a series of interlinked concepts such as family, locality, association, and group.

Frazer begins by distinguishing three types of communitarian thought: vernacular, political, and philosophical. The first of these gets little attention in the remainder of the book and Frazer is explicitly concerned with the work of political communitarian thought in the works of Henry Tam and Amitai Etzioni as well as the political platforms of Tony Blair and Bill Clinton. The analysis of these two very distinct threads of thought within the communitarian tradition is both illuminating and thorough. The central problem for communitarian analysis from Frazer's point of view is the vague meaning of "community" that lies at the heart of both types of communitarianism but is left strangely underanalyzed in either body of thought.

Frazer devotes a preliminary chapter to analyzing the concept of "community" and then uses this analysis to anchor the subsequent chapters on family, locality, and the larger political society. She is informed by social theory as well as political literature in this quest and she does an admirable job of pinning down what exactly the community is from a number of theoretical vantage points. While community,

as it is characterized in both strains of communitarian thought, is fundamentally enmeshed in social relations, Frazer rightly concludes that it is its transcendent character that distinguishes the community from what might otherwise be called an association. And it is this capacity to transcend, coupled with the shared values and boundaries implied, that creates problems for democratic politics according to Frazer, for a number of reasons that she develops in succeeding chapters.

Before she turns to look at the family, locality, and political society more broadly, Frazer turns her attention to the connection between interpretivism and social constructionism in communitarian thought. She concludes that communities necessarily play a role in the grounding of interpretations, but cannot be a solution to adjudicating the resolution of differing interpretations. She argues that social constructionism is useful to the extent that it is clear about "the mechanisms and processes the communitarians hypothesize" (p. 131). Frazer again draws together a disparate number of sources to provide a rigorous account of what the exact social constructs in building a community are. Within communitarian social constructivist thought however, Frazer acknowledges a tension. Ultimately, if the community is a social construction, it may be altered. As such, social constructionism often leads to the questioning, indeed dismantling, of previous social constructs (p. 138). This strain between a transcendent, bounded, and organic community and the shifting, fluid nature of politics is an underlying theme of Frazer's analysis.

Frazer explores this theoretical tension by disaggregating the "community" into locality, family, and political society, in three separate chapters. In all three cases she argues that the use of "community" as a theoretical category has perverse effects. In essence, community as it is conceptualized in communitarian thought creates a politics of boundaries. The metaphor she has in mind is a series of nested boxes; the family, the place, and the nation-state are all bounded communities, each conceived to fit nicely into the next and building community at each stage. Frazer rightly points out that the nature of identity and democratic politics moves toward the disruption of such boundaries. "A preferable conception of democratic politics emphasizes the unsettlement of boundaries" (p. 7). And the "community" as it is currently understood cannot "capture the range of social relations and conflicts that make up these organizations, institutions and agglomerations" (p. 191). According to Frazer, the preferable metaphor would be that of a network, which would better encompass the tension between the unity and the conflict in her title. A question immediately arises as to the implications of losing the concept of community and the boundaries and membership that go with it. Without hard boundaries circumscribing a community and a clear notion of its membership, how does one ensure the standard bearers of democratic theory practice: accountability, representative institutions, and transparent authority?

Ultimately, not only has Frazer made an important contribution to communitarian theory (both political and philosophical variants) by forcing its proponents to take more seriously the concept of community and how it is to be reconciled with the principles of democracy, identity politics, and social constructivism, but she has contributed to all those other bodies of literature that have, hitherto, used an undertheorized notion of community: from communitarian feminism to criminal justice reform to support of expanded local governments. The analysis is rigorous and methodical, the organization clear, and the writing lucid. This book would be a useful contribution for anyone interested in liberalism or communitarianism, in both theory and practice.

Millenarianism and Messianism in Early Modern European Culture Vols. 1–4. Edited by Matt Goldish, Richard H. Popkin, James E. Force, Karl A. Kottman, and John Christian Laursen. Dordrecht: Kluwer Academic Publishers, 2001. 784p. \$253.00.

All societies contain some image or vision of their own perfection—of life, both individual and collective, free of the burdens of history and death. In the history of civilizations, these visions have often served as a fulcrum of radical change and social transformation. Just as often, they have served as the ideological underpinnings of more abortive movements of social change. Moreover, in the lives of individuals and groups, they have often led to a renunciation of the world and its concerns in search of a more private wholeness, in a life of contemplation and retreat.

While some image of human perfection, free of suffering and death, has characterized all human societies, the notion of a perfect social order, posited over and against the chaos and mutability of human history, is more intimately related to what Max Weber defined as those universal problems of meaning addressed by theodicies: that is, the promise of salvational religions to overcome the inherent finiteness of human existence, the problems posed by the discrepancy between fate and merit, and the perfection of the transcendent order in contradistinction to the imperfection of reality. The positing of a harmonious social order characterized by the full satisfaction of human wants, peace, equality, and the absence of discretionary authority—which has been identified with different strands of utopian and messianic thought-is thus rooted in the selfsame dynamic that gave rise to salvational religions. There thus would seem to be some innate connection between millennial speculation as a mode of thought and social action and the vision of salvation held out by the different world-historical religions.

The Western tradition of millennial thought and action was rooted in both early Hellenistic images of the perfect city or a perfect past, as illustrated in Hesiod's Works and Days, and in the particular religious visions of both Judaism and early Christianity, with their stress on an otherworldly future, an Endzeit of absolute perfection still to be experienced. To these must be added the speculation of the early Church Fathers and Christian philosophers on the prelapsarian state of nature. The early Christian communities, of course, lived in an intense expectation of the Second Coming and the End of Days, which, until the third and fourth centuries, retained their "this-worldly" character. The linear temporality of Christianity in positing an end to historical time, posited also the ultimate reunion of historical and sacred dimensions of time through its eschatological notions. This perspective, bearing as it does on the millennial element of Christian belief, was, however, through its very nature, a centrifugal, antinomian force, working against the concrete needs of institution building as perceived by many of the early Church fathers, in both the ante-Nicene and post-Nicene periods. Indeed, this centrifugal tendency was manifest in the reigns of Constantine and Theodosius, when an apocalyptic separatism led many groups of Christians beyond the boundaries of a Church tainted by its compromise with secular authority. Its potentially disruptive force was fought by none as strongly as St. Augustine, who in his writings, especially in City of God and the Confessions, laid out a different temporal schema, which, while maintaining the linear structure of sacred time, removed its end from any possible embedment in the mundane sphere of secular historical processes. In its stead, he posited the "ends of time" beyond time proper and beyond

history, thus separating salvation from society and history from eschatology. In temporal terms, the separation of the civitas terrena and civitas Dei effected an ultimate disjunction of sacred and mundane times and "histories," by declaring events in the saeculum irrelevant to the schema of salvation.

The disembedment of sacred time, and so of the eschatological moment from mundane historical referents, dictated, however, the necessity of positing a new realm where people and especially Christians could orient their lives to the fount of the sacred. On the most general level, this was achieved through the ministrations of the Church. More concretely, the realization of salvation was achieved in the sacraments, which provided that arena in which the communicant could establish contact with the sacred dimension of existence. The sacraments thus became that arena where sacred and profane met and salvation was attained, in contrast to its previously imminent perceived realization at the end of historical time.

Such a "solution" to the eschatological orientations of Christian belief was, of course, incomplete, and many alternative visions appeared over the millennia of Christian history, from lay reform movements such as the Devotio Moderna, to Neoplatonic mysticism, to the folk traditions of the Land of Cockaigne and the rituals of carnival. The most salient expression of alternative visions was in the different millennial movements of the Middle Ages, which broke at the same time with the sacramental doctrines of the Catholic Church and with its institutional structures. By propounding a thisworldly millennialism, one seen to take place within mundane history, they effectively broke down the institutional constraints that had, within the Catholic Church, bounded millennialism to otherworldly interpretations and pursuits. Thus, in many medieval millennial movements, such as the Waldensians and later the Taborites, there developed, concurrently with a break with the sacramental doctrine of the Church, the positing of new boundaries of collective membership, that is, of the salvational collective, as well as new principles and structures of authority.

The early modern period—that covered by these four volumes-experienced an outburst of millennial expectations and millennial-inspired action across Europe. And while much has been written on the Protestant aspects of this millennial outburst, these collected volumes illustrate just how endemic millennial speculation was, not only among the different Protestant sects but also among Catholics and Jews as well. The themes of the volumes run from Jewish Messianism in the Early Modern World (Vol. 1), to Catholic Millenarianism from Savonarola to the Abbe Gregoire (Vol. 2), to The Millenarian Turn: Millenarian Contexts of Science, Politics and Everyday Anglo-American Life in the Seventeenth and Eighteenth Centuries (Vol. 3) to Continental Millenarians: Protestants, Catholics, Heretics (Vol. 4). All the chapters were presented as papers at a series of conferences organized by Richard Popkin. Popkin is perhaps best known in the scholarly world for his The History of Scepticism from Erasmus to Descartes, which was first published in 1964 and attained the status of a classic. For the last twenty years or so, however, he has concentrated most of his efforts on the study of millennial groups and thinkers, contributing significantly to the vast scholarly literature devoted to this subject. The current volumes include chapters by some of the best-known scholars working in the history of millennial thought, dealing with personages and themes both known and more esoteric. The vast majority of the contributions are of historical focus and deal with either small groups of virtuosos or exceptional thinkers within the different religious communities. Much less attention is paid to sociological factors, to issues of group dynamics, and to the broader societal implications of millennial speculation in the periods under consideration. One has the sense that the conferences were very much of historians and scholars working in the field of the history of ideas and much less with the intersection of these ideas with broader social processes (such as the emigration to New England in the 1630s, for example).

There are exceptions to this characterization, most often in the first volume, dealing with Jewish millennial speculation. Fascinating in this volume is the focus not only on intra-Jewish debates, but on the relation of Jewish millennial speculation with Christian developments. Different groups of Sabbatian thinkers are discussed in different chapters, but so are the millennial traditions of certain "converso" groups. Quite a few of the chapters deal with individuals who, in one way or another, bridged the Jewish and Christian worlds—either Christians following Jewish messianic speculation or Jewish converts to Christianity engaged in calculating the Second Coming of Christ. Richard Popkin's own chapter on "Christian Interest and Concerns about Sabbatai Zevi" forms a lynchpin of those essays dealing with joint Christian-Jewish speculation on the immanence of the millennium.

The second volume, on Catholic millenarianism, is, perhaps not surprisingly, the shortest. It opens with a masterful essay by Bernard McGinn, one of the leading scholars of millennialism, giving an overview of Catholic millennial speculation—arguably the least studied of the millennial phenomenon (for reasons made clear in the beginning of this review). This is followed by another intriguing essay by Popkin on Savonarola's thought, which in fact connects Savonarola's millennial speculations to his critique of philosophy. In this volume, too, the Jewish-Christian nexus of millennial thought plays a strong role, not least in the case of the French revolutionary priest Abbé Gregoire, for whom the emancipation of the Jews was part of a millennial scenario.

The third volume deals with more generally familiar themes in millennial studies: the thought of Joseph Mede, Issac Newton, Robert Boyle, Joseph Priestly, and others, and the millennial rhetoric and tropes of seventeenth- and eighteenth-century Britain. As in the other volumes, the emphasis is on relatively circumscribed case studies of historical figures, rather than on a political or sociological analysis of broad social movements.

The final volume returns from the Anglo-American context to millennial speculation on the Continent, with essays on Dutch millenarianism; studies of the Frenchmen Issac Le Peyrere, Pierre Jurieu, and Pierre Bayle; of German Pietism, Rosicrucianism, and of the fascinating link between Arian and millennial heresies. A major figure in the latter was Miguel Servetus, who—as readers of Popkin's early work know—was burned as a heretic in Calvin's Geneva and for whom Sebastian Castellio offered a spirited defense predicated on a skeptical consciousness, that the very nature of a Deus abscondidus makes it impossible to go so far as to burn someone as a heretic since we cannot, ultimately, be certain of our own knowledge.

The chapters are all written for cognoscenti; they are not introductory texts, nor do they provide sufficient context for those not already knowledgeable about the issues studied. However, for those students and scholars already committed to the study of millennial voices, these volumes will open new vistas. Perhaps their most important contribution, which is much inspired by Popkin's own work, is in the study of those individuals and groups who bridged religious communities and social universes. Indeed, with the focus in so many chapters on the shared cognitive universe of millennial speculation (across religious boundaries), an important new dimension is opened in our understanding of early modern mentalities, at least among a fascinating and interconnected group of global (or at least trans-Atlantic and inter-European) elites.

Environmentalism Unbound: Exploring New Pathways for Change By Robert Gottlieb. Cambridge, MA: The MIT Press, 2001. 408p. \$29.95.

David Schlosberg, Northern Arizona University

The key argument of Robert Gottlieb's Environmentalism Unbound is that an integrated focus on pollution prevention and environmental justice can lay the groundwork for fundamental environmental and social change (p. xiii). The aim is to develop a common vision and a more "embracing language" for environmentalism that is more broadly appealing than a mainstream focus on nature and species and more broadly applicable to a range of environmental and social issues. Such an expanded environmental discourse—integrating the workplace, the social, and the ecological-would make for an unbounded and more successful environmentalism. This is another wonderful offering by Gottlieb, right up there with his Forcing the Spring (1993). The recognition of diverse discourses of environmentalism and social justice is a challenge to movement strategies, and Gottlieb takes on the issue with a focus on both a broad vision and everyday practice.

The opening chapters, laying out the historical boundaries of the environmental movement and the possibilities of moving beyond those boundaries with reference to pollution prevention and environmental justice, provide a thorough and well-argued framework for the cases that follow. Gottlieb's examination of the development of the environmental justice movement goes beyond the standard fare. He delves into the internal politics and definitional conflicts in the movement, and focuses on issues such as land use, brownfields redevelopment, and transportation. And in attempting to forge a larger discursive community across different parts of the environmental movement, Gottlieb demonstrates how a mainstream concern with air quality, for example, can also be articulated from the point of view of environmental justice by focusing on diesel fumes, children's health, and the transit needs of poorer communities. Such expanded discourse, he argues, can lead to a more inclusive and challenging environmentalism.

'Clean production" is the place where pollution prevention and environmental justice can come together, and Gottlieb looks at three industries—dry cleaning, janitorial, and food production/distribution—with an eye toward his proposed common vision. One key question for Gottlieb is how to overcome the worker/community divide. In response, his case studies attempt to get at community support for a change in environmental practice, for example, Korean community development agencies' support for the transition to less toxic dry-cleaning processes. But while the stories and descriptions of the case studies are thorough in and of themselves, Gottlieb is not always successful in his aim of thoroughly tying together the discourses of pollution prevention and environmental justice. In the dry-cleaning example Gottlieb offers an excellent discussion of how industry and regulatory agencies are slow to come around to a viable, front-end alternative to the toxic emissions of the conventional dry-cleaning process and gives insight into the problematic regulatory process with regard to chemicals (a focus on the tail end rather than prevention and the bias toward industry-sponsored and -supported initiatives). While Gottlieb then demonstrates the possible role of community organizations in convincing cleaners to retool with nontoxic processes, the broader link to the discourse of environmental justice is weak. More discussion of the principles of environmental justice, including, for example, demands for the cessation of the production of toxins and the right of all workers to a safe and healthy work environment, would have helped strengthen the pollution prevention/ environmental justice link. In the case study of janitorial

work and workers, the discussion is, again, comprehensive, well researched, and thoroughly documented, but there is not much of a link made—or a "common vision" laid out—across the various issues and discourses brought up in the chapter. Gottlieb wants us to see how the disparate discourses existing around environmental issues, labor conditions, and community-based job creation can be brought into a broad and linked environmental social movement. While the vision is clear, the case studies seem to prove the difficulty more than the promise of such a move.

That is, until Gottlieb gets into two chapters on the politics of food production. The links among community needs, pollution prevention, and environmental justice are much more directly and clearly made here. Pesticide concerns are linked to nonpoint pollution, which is linked to farmworker health, which is linked to sustainable agriculture, and all relate to both health and elimination of hunger. The reaction to the USDA proposed rules on organics is a wonderful example of an issue where the potential for broad coalitions has been awakened. In response to Agriculture's attempt to certify the use of sewage sludge, genetic engineering, and food irradiation as "organic," organic farmers and consumers teamed up with environmental advocates and pesticide critics (among others) who had been arguing for sustainable food production. Again, the food chapters are wonderfully rich and well documented, with not just coverage of the last 30 years of the organic agriculture movement, but discussion of depressionera relief gardens, wartime victory gardens, community gardens, school gardens, market gardens, and farmers markets. In addition to this thorough approach, Gottlieb here demonstrates the potential discursive links among different audiences concerned with the current food production regime. One only has to be a regular visitor to a farmers market (a description of which opens the book) to understand the potential "embracing language" that sustainably produced food can have. Farmers markets link urban justice to sustainability through an alternative mode of food distribution and encompass a response to a variety of environmental, social, labor, and market issues (and are also attractive across the political spectrum).

But even here, the notion of a unified, yet unbound, environmentalism is incomplete. While links are made discursively, and food issues may bring together members of diverse discursive communities, no social coalition has been formed that encompasses all of the food issues Gottlieb addresses. There are numerous groups and efforts surrounding a critique of the current food regime, but as Gottlieb notes, the effect is still less than the sum of its parts (p. 271).

Gottlieb identifies the project of Environmentalism Unbound as an outline of the possibilities for reenvisioning institutions and systems, including challenges to structures of power that maintain current systems and discourses; his case studies offer "snapshots of these possibilities for reenvisioning" (p. 275). But in offering a visionary, yet pragmatic, discussion of the emerging discourse and obstacles faced, Gottlieb is still not convincing that disparate parts of a movementits various concerns and values—can be brought into a single discursive project, which was the hope at the start. Environmentalism's biggest challenge, he concludes, is in providing a singular "totalizing vision" (in Hilary Wainwright's terms). Maybe that focus on a single vision is itself the problem, however. An environmentalism unbound may be a collection of visions with multiple points of linkage, which comes together on particular issues yet eschews the singularity of one common vision. That type of environmentalism is in evidence in numerous recent protests regarding globalization, and certainly abounds in the farmers markets Gottlieb celebrates.

**De-Facing Power** By Clarissa Rile Hayward. Cambridge: Cambridge University Press, 2000. 224p. \$54.95 cloth, \$19.95 paper.

P. E. Digeser, University of California, Santa Barbara

Clarissa Rile Hayward's book begins with the provocative claim that focusing on the relationship between the powerful and the powerless is not the best way to study power. Traditional theories of power have concentrated on the question of what it means for A to have power over B. By seeking to discern who possesses it and how their possession diminishes the freedom of others, researchers have tended to put a face on power. In contrast, Hayward "de-faces" power by arguing that it need not entail a relationship between A's and B's but can be understood entirely in terms of how the field of action of both the powerful and the powerless is defined.

Drawing on the poststructural work of Michel Foucault, Hayward advocates seeing power as a set of social boundaries that can both constrain and enable action. These boundaries include laws, rules, norms, conventions, practices, and institutional arrangements. They create a space for action, define what constitutes knowledge, establish the urgency of problems, legitimize the forms of discipline, and generate a set of identities. Like Foucault, Hayward argues that we can never escape such power relations. However, unlike Foucault, Hayward emphasizes the fact that we are differently situated vis-à-vis these boundaries and that these differences have an ethical import. Some of us have the resources and the opportunities to reflect upon and seek to transform the norms that govern our conduct and some do not.

By drawing on the discourse theory of Jürgen Habermas, Hayward endorses the normative claim that those who are affected by a rule or practice should have a say in its creation. The capacity to shape and not escape the boundaries that define our fields of action is what Hayward calls political freedom. Those who lack the resources to rethink and reformulate the norms that govern their lives lack political freedom and suffer from domination. Domination, however, is not a matter of A's pushing around B's (although this certainly occurs) but entails the existence of asymmetries in political freedom. In emphasizing the ways in which power affects all parties, Hayward argues that there is no space for negative freedom if such freedom means acting outside social constraints. Hayward wants to deface (as in disfigure) the traditional portraits of power that emphasize a relationship between the powerful and the powerless and a realm of negative freedom that exists beyond power.

The beginning and end of the book engage in some quite refined theoretical work, while the middle chapters illustrate the research implications of defacing power by offering two case studies in education. Using the method of participant observation, Hayward seeks to explore (as opposed to explain) the ways in which power operates in two very different fourthgrade classrooms. One is in a very affluent suburb and the other is in a poor, inner-city district. By understanding power as "a network of boundaries that delimit, for all, the field of what is socially possible" (p. 3), Hayward uses these case studies to show how power constrains and enables teachers and students in both classrooms.

Hayward is well aware of the limitations and advantages of her chosen approach. She presents her conclusions in a very measured form as trying to elicit some hypotheses about how constraints shape teaching. Hayward's analysis, however, would be strengthened by talking more about the advantages and disadvantages of using classrooms (as opposed to other arenas) and fourth graders (as opposed to older or younger students) for studying power. Hayward is also aware that her own democratic/participatory response to asymmetric

power relations entails norms that are neither natural nor universally shared. She acknowledges that these norms would "discourage a range of possible ways of ordering social life, including those supported by many religious and other traditional views" (p. 176). But the range of those excluded by Hayward's democratic alternative extends beyond the believers in divine commands and natural hierarchies. It also excludes the shy and the inarticulate. A universal call to politicize all social norms will appear burdensome, if not oppressive, to those who prefer a quiet private life to the hubbub of the political or those who seek to explore and exploit, as opposed to question and legitimize, the norms they have inherited. Whether Hayward's argument is open to these criticisms depends on how one understands political freedom. On the one hand, Hayward may be claiming that political freedom exists when the opportunity exists to call into question the norms that govern one's life, even if one decides not to act on that opportunity. Acting on one's political freedom need not be a norm for everyone, although the opportunity to act should be open to all. On the other hand, Hayward may be making the stronger claim that freedom can be found only in critically thinking about and collectively acting on our capacities to establish social norms. The opportunity to exercise political freedom is not sufficient and so those who prefer not to participate in norm formation are not free. On this reading, the position is open to the risk that, by forcing reticent people to participate, they can be forced to be free.

Hayward's discussion of defacing power is most successful in attacking visions of negative freedom that require complete independence of all norms and conventions, or what Richard Flathman calls unsituated negative freedom. Rejecting unsituated negative freedom, however, does not entail accepting political freedom as the only or the most important form of freedom. As Hayward notes, Flathman's situated negative freedom acknowledges the necessity of social norms and conventions. However, the project of defacing power would seem to leave situated negative freedom intact, and calling into question conventions, norms, and institutions could be an exercise of this form of negative freedom. Nevertheless, these comments regarding Hayward's discussion of freedom do not diminish the compelling nature of her analysis of contemporary disputes over power or of her exploration of defacing power. Hayward provides an important contribution to the problem of how to study the power of norms and institutional structures.

Cultural Goods and the Limits of the Market: Beyond Commercial Modelling By Russell Keat. New York: St. Martin's Press, 2000. 224p. \$69.95.

Peter Lindsay, Georgia State University

With respect to markets, the twentieth century closed with a great deal more ebullience than it opened. Not that 1900 was a watershed in antimarket thinking—that was still to come. No, the contrast between *fins de siecle* is striking because whatever criticisms markets had to endure during the final century of the millennium seemed to have all but vanished by its close.

The problem of our ebullience is that it renders any difficulties we may have with markets increasingly awkward to express. How, for instance, might those in academic, scientific, and cultural enterprises respond to being left to the iron hand of market discipline? What counts as a good reason *not* to conform to the same pressures as felt in the "real world"? If consumers will not support a given activity with dollar votes, then what possible defense, short of elitist pleas, can haute culture muster? These are precisely the sorts of difficult

questions addressed in Russell Keat's Cultural Goods and the Limits of the Market. If anything, then, the book is timely. It is, fortunately, also quite good.

Keat's general claim is not that the market is bereft of appeal, but simply that there are "certain kinds of social activities and institutions which are appropriately governed by the market and others that are not" (p. 3). To illustrate the latter sort of activity/institution, Keat draws on Alisdair MacIntyre's conception of 'practices,' or (in MacIntyre's words) "socially established cooperative activity through which goods internal to that form of activity are realised in the course of trying to achieve those standards of excellence which are appropriate to...that form of activity" (p. 22). (Obvious examples are dance, chess, sports, and scientific research.) The claim here is that practices give expression to different sources of well-being than the market does. Hence societies that allow the market to, in Habermas' parlance, 'colonize' all social life (these practices, in particular) do so at their own peril.

Keat's account of the market's shortcomings is fairly familiar. First, he reminds us that at best the market only satisfies existing preferences (and often it does not even accomplish this), while doing little for "the kinds of critical or reflective processes upon which, ideally, individuals might wish to base their judgements of what is valuable to them" (p. 46). Second, he examines, and, in a chapter devoted to the issue, questions the extent to which consumption and well-being are positively correlated. Finally, he notes that many of the things we value (family, friends, commitments) have little bearing on the market.

Fortunately, where the market falls short, practices can, if preserved, provide relief. For instance, "people's ability to develop their own sense of what is valuable . . . will be enhanced by their access to cultural practices in which the tensions and conflicts between various conceptions of the good . . . are thematized and explored in both discursive and non-discursive forms" (p. 47). The key to this argument lies in the distinguishing feature of practices—namely, their rejection of "want-regarding" value in favor of "ideal-regarding" value. Practices have internally generated standards of excellence (such as the arc of a diver or the laboratory technique of a scientist) that are at least conceptually distinct from (although too often actually sullied by) the tastes of nonauthoritative consumers. As such, they offer intrinsic rewards ("internal goods") quite apart from whatever else (honor, pride, power, money) might come the way of the practitioner.

The problem, however, is that because such rewards are independent of a practice's ability to stay afloat financially, it can have only a contingent chance for success in a market-dominated society (i.e., in a society where rewards and financial return are indistinct). If forced to conform to market rules of survival, many practices would simply cease to exist. Moreover, because such a society would view success through a market framework, any pleas to spare the practice would likely fall on deaf ears. The task, as Keat sees it, is thus to promote spaces for practices, either as supplements to markets or through the infusion into markets of the "practice-like characteristic of productive activities" (Chapter 6).

The strength of Keat's argument is derived largely from his success at articulating the appeal of practices (for both producers and consumers). To the already converted, such articulation offers reassuring confirmation of what might be only intuitively understood. To the rest, it serves a more vital role of helping to broaden the support base for practices.

As we have seen, however, articulating appeal will not take either camp past the lament, "Yeah, sounds great, too bad the market won't support it." Hence, Keat needs also to show why practices are not just a desirable, but a just supplement

to the market, a task he saves for the final chapter. The argument there turns on the distinction between ends and means. The virtue of markets, according to their nonlibertarian "classical" defenders, lies in their ability to generate "the kinds of human goods that contribute to people's material well-being." But, he goes on, "Suppose one can show that...the market does not always succeed in contributing maximally to everyone's well-being?" (p. 150). As he has shown precisely that throughout much of the book, he is able to conclude that the limits to the market can be established by the very arguments that offer it its greatest support. Thus the "bottom line" gives way to well-being, as the argument for market discipline is trumped by an argument of a higher calling. That the market cannot support a productive enterprise turns out to have little bearing on the more vital question of whether a good society should support it.

The argument has great force, in large part because Keat presents it with clear and coherent language. There are, however, a few problems here that should not go unmentioned, problems owing to the fact that this is not so much a book as a collection of essays on a theme. As such, and because Keat has made little effort to adapt the essays into a single cohesive argument, much gets repeated. (Twice we read MacIntyre's verbatim definition of practices [pp. 22, 82], as we do his verbatim definition of institutions [pp. 24, 122–23].) In and of itself, repetition is not always such a bad thing, but where it adds little in the way of clarity, it serves only as a needless annoyance.

The more pronounced difficulty with the essays-on-atheme approach involves the layering-on of supportive but ultimately distracting arguments. Many of the chapters offer refinements of a number of other theorists, among them Mark Sagoff (Chapter 3), Michael Walzer (Chapter 4), and Robert Lane (Chapter 7). I say refinements because, with all his interlocutors, Keat is in general sympathy, looking only to offer fairly subtle critiques and distinctions. The trouble is that much of the force of his overall argument can too easily get lost in what sometimes amounts to little more than nitpicking.

Such problems are unfortunate, but they should not obscure the value of Keat's contribution. His plea for perspective on markets offers a much needed reminder of arguments that—to continue the earlier historical comparison—have not had great currency since the days of T. H. Green, L. T. Hobhouse, and R. H. Tawney. It is especially refreshing to see these arguments reintroduced in the social and intellectual context of a very different time.

Faith, Reason, and Political Life Today Edited by Peter Augustine Lawler and Dale McConkey. Lanham, MD: Lexington Books, 2001. 272p. \$70.00 cloth, \$24.00 paper.

Lief H. Carter, Colorado College

These 14 essays range as far and wide as the sprawling title of this collection implies. The papers originated at a 1999 interdisciplinary conference at Berry College on politics, religion, and community. Most of the authors teach at Southern colleges. They come not only from political science and government departments but also from philosophy, English, sociology, religion, and theology departments. Twelve of the 14 are male. On first glance the collection might appear to be "traditional." Indeed, many of the essays, e.g., Daniel Mahoney's treatment of Solzhenitsyn on "Repentance and Self-Limitation in the Life of Nations," explicitly raise religious themes and questions.

However, as the editors freely admit in the introduction, these essays are diverse and comprehensive rather than thematically tight. They are not traditional. The postmodern condition, which frees us from the obligation to honor ruling disciplinary canons, allows these authors to write about whatever strikes their fancies. Michelle Brady writes of "Autonomy and Community in Aristotle," while James Pontuso writes about Trevanian's "Perfect Postmodern Tale," the 1979 novel *Shibumi*. Paul Cantor's essay (see below) includes this line: "Who know what happens when you tickle a Klingon?" (p. 30). This fancy-driven diversity makes the collection a surprisingly good read.

An excerpt, chosen almost at random, from the index suggests the scope of this book's diversity. In the middle of the "Gs" we find in order, with no omissions, these six entries: Gilligan's Island; Girard, Rene; God; Goethe; Goldberg, Whoopie; Gore, Al. (God gets by far the most page references here, but the index as a whole gives roughly as many references to Hegel and to Heidegger as it does to Christianity and to Augustine.) The editors' arrangement of the essays also belies any unifying theme. The book might have sequenced together essays by Gregory Johnson and Henry Edmondson III featuring Flannery O'Connor or placed together essays by Paul Cantor and Diana Schaub, both of which draw on political themes in Star Trek. But the first 10 of the 14 essays appear to be listed alphabetically by author. Johnson and Cantor belong in the first 10, while Edmondson and Schaub appear, out of alphabetical order, among the final four.

While no single subject matter unifies these essays, a plurality of them explicitly takes up the "end of history" theme. In doing so they raise nice questions about the shape of global governance mechanisms. Indeed, normative and religious questions, according to these authors, inevitably arise because popular democracy is clearly not itself a viable model for global governance. Joseph Knippenberg's essay on Leo Strauss and the end of history raises these questions most directly. A second, and perhaps counterintuitive, theme is that many of these authors embrace postmodernism. Editor Peter Lawler's "End of History 2000" touches on themes raised more fully in his recent book, Postmodernism Rightly Understood (1999). Both Lawler, who links Thomism and postmodernism, and Pontuso's working of Shibumi give Rorty his full and fair due. Ashley Woodiwiss writes of "A Postmodern Augustinian Recovery of Political Judgment." Marc Guerra analyzes "Christianity's Epicurean Temptation."

A few essays get overly dense. Tom Darby's "On Spiritual Crisis, Globalization, and Planetary Rule" tries to answer the question, "So who has the right to rule the planet?" (p. 60). His answer tries to link Alexandre Kojeve, Leo Strauss, Carl Schmitt, and Martin Heidegger, not to mention Bacon, Nietzsche, Aristotle, and Christ. In doing so he puts too many academic balls in the air to juggle successfully. Most of the time, however, the writing and editing are remarkably concise. They display little tendentiousness. Mining this book almost at random can extract many nuggets. For this reviewer, most of the nuggets consisted of discovering new minds: Kojeve and Trevanian, already mentioned, and Paul Seaton's discussion of the work of Pierre Manent. Just within the last year, I discovered Rene Girard and, thus, particularly appreciated Stephen Gardner's "Tocqueville, Girard, and the Mystique of Anti-Modernism." Readers who don't know Flannery O'Connor's short story "Revelation" may find Johnson's juxtaposition of this Southern "Christian" with Walker Percy's analysis of stoicism in Southern culture especially satisfying.

Beyond the specific nuggets, this collection yields at least three less tangible satisfactions. First, these essayists, like most of the rest of us most of the time, are not academic superstars. We do not have here the academic equivalent of a West End theatrical triumph. These essays instead give the satisfaction of seeing your hometown theater company tackle a series of major plays, doing the material inventively and doing themselves proud in the process. Second, whether or not these authors are relatively young, the collection does describe interesting new directions that liberated and pluralistic scholarship can take. Finally, for those of us of a certain age who find it harder to communicate political wisdom to students who are increasingly disengaged, cynical, and/or merely "local" rather than "cosmopolitan," it helps to learn some new teaching materials from the more playful and fanciful of these essays. I think I'll try Diana Schaub's "Captain Kirk and the Art of Rule" on some undergraduates this year.

Individual essays in the collection may resonate deeply with readers' own academic projects, but for most of us this is more a browsing book for professors than a collection to assign en masse to a graduate seminar. There are many good reads here. Indeed some of them may read better precisely because they help us sharpen our own positions in contrast to those of the authors.

Aleksandr Solzhenitsyn: The Ascent from Ideology By Daniel J. Mahoney. Lanham, MD: Rowman and Littlefield, 2001. 200p. \$65.00 cloth, \$21.95 paper.

Peter Augustine Lawler, Berry College

This very remarkable and most timely book differs from others on Solzhenitsyn by highlighting his "critique of ideology" and his "recovery of the 'natural world" (p. 3). Ideology, for Solzhenitsyn, is the name for the lie characteristic of the twentieth century: Human beings, through historical transformation, can end suffering and so make virtue or the distinction between good and evil superfluous. The state and God can wither away because we will no longer be political and spiritual beings. We know that ideology could not change human nature or what Daniel Mahoney calls "the ontological structure of the world," but it could magnify human evil to genuinely monstrous dimensions. Solzhenitsyn's contention that communist ideology was responsible for the murder of tens of millions has become much less controversial in recent years. The Black Book of Communism, Mahoney shows, provides abundant evidence for what Solzhenitsyn already knew.

Solzhenitsyn presents numerous examples of courageous, personal resistance to the lie of ideology as evidence that the natural world exists. The natural or real world of human beings is where conscience cannot be exterminated, where we cannot help but distinguish between good and evil. The truth is, Solzhenitsyn said, that human beings are born to die, and so they are not meant only to be happy. They cannot live well unless they have a clear and calm view of death, and they must be willing to risk their lives to live responsibly in light of the truth. The Marxist has never been able to explain why at history's end we will be simply happy if death itself does not wither away and we remain conscious of all that is implied in our individuality. For Solzhenitsyn, the idea of the end of history in all its forms is a self-deceptive lullaby that turns us away from the ineradicable necessity of personal responsibility. The recovery of the natural world through reflection on the "point of view" at the foundation of the dissident experience may well be the antidote to the progressivist or historical imagination.

Mahoney makes the jarring but brilliant and perfectly true observation that Solzhenitsyn is a postmodern foundationalist. He is a stern critic of the laziness and moral weakness or relativism of postmodernism as it is usually understood. But if postmodernism is really a reflection on the failure of the modern project to conquer human nature, then Solzhenitsyn is a proponent of postmodernism rightly understood. At the end of his famous Harvard Address, he contends that medieval thought was distorted because it was excessively spiritual;

it slighted the fact that human beings have bodies. Modern thought was distorted because it tried to understand human beings as simply bodies. It denied the fact that they have souls or a spiritual life. Postmodern thought—given the experience of medieval and modern excesses—can be based on a realistic assessment of the places of both the material and spiritual dimensions of human existence. Postmodern thought is the foundation of a world fit for human beings, not angles or pigs.

The idea that the dissident reflection might actually be the foundation for the reconstruction of social and political life based on a balanced view of the truth about human nature Mahoney rightly criticizes as somewhat utopian. But it is also the basis for Solzhenitsyn's most realistic proposals for political reform, including the reinvigoration of local selfgovernment as the starting point for civic consciousness and his promotion of a form of Russian national patriotism that is far from imperialism. The being who is neither mind nor body needs political pride tempered by religious repentance; human beings must both assert themselves and limit themselves to fulfill what is best about their natures. Solzhenitsyn opposes most vehemently the characteristically modern resistance to the idea of human limitations. The truth is that we are not self-made; we must acknowledge a natural and divine order which we have been given and to which we are somehow responsible. We must acknowledge that what we have been given, even death, is good for us. But Solzhenitsyn also provides examples of towering political excellence, of the fact that not all human pride is vanity. The best of these, Mahoney meticulously explains in his central chapter, is the unjustly neglected Russian statesman Pyotor Arkadievich Stolypin.

Solzhenitsyn, with his belief in natural conscience and the virtue of repentance, is undeniably a Christian. Mahoney notices that he was not always one. He converted to Russian Orthodoxy because he discovered through his natural powers and dissident experiences that Christian anthropologyits account of man—is true. But he is a curiously moderate or political sort of Christian. At one point, Mahoney claims that Solzhenitsyn "combines Pascalian 'existentialism' and classical realism" (p. 33), which means that he is partly Augustinian and partly Aristotelian. That claim is meant to correct the characteristic excesses of the best interpreters of Solzhenitsyn prior to Mahoney. Some of them say he is an Aristotelian (Delba Winthrop and James Pontuso) and others an Augustinian (Robert Kraynak and Edward Ericson). But Augustinians, for Solzhenitsyn, disparage excessively the goods of the natural world; they exaggerate human misery and impotence. The Aristotelians exaggerate the completeness and self-sufficiency of the political and philosophical lives; the political philosopher does not account for all the longings and inevitable shortcomings of the whole human person.

The natural world is good because it is both moral and truthful, but it is not good enough for us to be completely satisfied by the goods it offers us. Our reflection on the good that is a human being culminates in mystery, and so a genuinely thoughtful person engages in dissident resistance against theoretical and practical efforts to abolish that mystery or make us totally at home in the world. The Solzhenitsyn-inspired dissident Mahoney even rebels against Leo Strauss's tendency to reduce morality to merely a tool for philosophers. Even the philosopher is not exempt from the moral responsibility that living in the truth gives us all.

Another way Mahoney expresses Solzhenitsyn's moderation is by saying that there is a dialectic between magnanimity and humility in his thought. The idea of dialectic suggests that the Christian and Aristotelian components of

Solzhenitsyn's thought are not merely mixed. Not only do the points of view of magnanimity and humility each reflect only part of the truth about human nature, they also fit together into some kind of whole, the whole that is the natural world and natural conscience. That would make Solzhenitsyn's "postmodern, post-totalitarian foundationalism" (p. 46) at least something like Thomism. Mahoney never does call Solzhenitsyn a Thomist, but he does say that the "natural goods" Solzhenitsyn defends "clearly point beyond themselves and are compatible with the truth of faith" (p. 102). Mahoney's exceptionally penetrating, wonderfully judicious, and always accessible analysis is on the cutting edge of thought today.

The Free and Open Press: The Founding of American Democratic Press Liberty, 1640–1800 By Robert W. T. Martin. New York: New York University Press, 2001. 288p. \$40.00.

Mark A. Graber, University of Maryland

The Free and Open Press is an exceptionally satisfying first book. Robert W. T. Martin revitalizes a debate over the status of press rights in eighteenth-century America that had grown tiresome over the past 20 years. Challenging Leonard Levy, his critics, and the ongoing republic/liberalism divide in American political thought, Martin's work offers an interpretation of free speech thought that explains why early Americans sometimes fought for and sometimes fought against press rights. Though Martin claims too much for his thesis at times, all scholars of American political thought and constitutional development should read his book.

When Americans during the eighteenth century spoke of a free and open press, Martin claims, they mingled two distinct concepts: a free press and an open press. The free press was a vehicle for exposing government tyranny. The open press provided all people with an avenue to express their political and social beliefs. These two concepts were conflated in colonial America, Martin notes, because proponents of press rights thought a press open to all was the best means of preventing government tyranny. During the Revolution and last decade of the eighteenth century, prominent Americans separated the two rationales. Whig advocates of the Revolution and Democratic-Republicans claimed that an open press was a kept press, biased toward the status quo and royal power. Jeffersonians during the 1790s regarded an open press as unnecessary, given the existence of multiple papers in most areas. Much of the debate surrounding the Alien and Sedition Acts, Martin observes, stemmed from political reactions to an emerging partisan press. Federalists feared a press that might weaken confidence in republican institutions. Jeffersonians championed a republican press that kept a close watch for government tyranny. Jeffersonians won the battle and lost the war. The Alien and Sedition Acts expired to the relief of all. The partisan press thrived throughout the nineteenth century. The modern theories of democracy that gave birth to the partisan press, however, would not be revived until the twentieth century.

Martin deserves particular credit for uncovering the important debates over an open press that structured much free speech debate during the eighteenth century. He presents much evidence demonstrating that for most Americans before the Revolution, a free press was a press that was open to all persons. Printing was a public calling, much as medicine or keeping a tavern. "Printers are educated in the Belief," Benjamin Franklin declares in the pages of *The Free and Open Press*, "that when Men differ in Opinion, both sides ought equally to have the Advantage of being heard by the Publick" (p. 55). Other printers similarly claimed that ownership of a

press gave them no right to determine the ideological content of what they printed.

This vision of an impartial press was undermined during the late eighteenth century. Many Americans during the Revolution believed that the press had a special obligation to scrutinize government. A partisan press, they believed, prevented government officials and their supporters from dominating public debate. Numerous journalists claimed that their obligation to print only reasonable pieces required them to take sides in controversial debates. One Revolutionary printer noted that no good arguments existed against independence from Great Britain (p. 86).

Eighteenth-century Americans did not distinguish the free press from the open press in quite the way presented by The Free and Open Press. Martin sees the free press as a republican instrument for retaining community control of the government, and an open press as a liberal instrument enabling persons to exercise their right to political advocacy. Arguments might be made for the reverse conclusions. The free press was a liberal instrument allowing those who owned presses to determine the use of their property. An open press was a republican instrument ensuring public exposure to ideas on both sides of political struggles. The best synthesis is that both free press and open press notions contained liberal and republican elements, and Martin is sympathetic to this general point. His work consistently observes that press thought in general has both liberal and republican dimensions, that distinguishing the two is a parlor game scholars are best off abandoning.

The Free and Open Press is a remarkably good book by any standard. The prose is clear, the jargon limited. Martin has done a fabulous job of reading the primary sources and integrating the secondary sources. He recognizes that constitutional history exists outside of courts, that the liberty of the press is more often defined by what is published than by what judges say at any given time. Martin has a wonderful story to tell and does not ruin his tale by consistently stopping to tell us that he is right while other distinguished minds are wrong. The conclusion highlights how the controversy over the free and open press is repeated at present in debates over whether the marketplace of ideas can be trusted to produce truth. Although Martin is not interested in theories of constitutional interpretation, his findings have important implications for free speech law. The Free and Open Press suggests that at the time the First Amendment was framed, the liberty of the press was the right to publish one's sentiments in a press, not the right of the person who owned the press to exclude reasonable commentary. The discarded fairness rule, in this view, was the original constitutional understanding. One wonders what Justices Antonin Scalia and Clarence Thomas might make of these findings.

The Ethics of Nationalism By Margaret Moore. Oxford: Oxford University Press, 2001. 272p. \$45.00.

Chandran Kukathas, University of New South Wales at the Australian Defence Force Academy

This fine study purports to offer "a normative theory of nationalism." Such a theory is needed, the author claims, because most of the literature on the ethics of secession proceeds on the mistaken assumption that the normative problem of state breakup is best addressed by applying established liberal arguments or values to the issue at hand. In fact, however, it makes little sense to derive a theory of secession in this way, rather than by considering directly the kinds of normative claims secessionists make. These are nationalist claims. We need, moreover, to recognize that well-

known accounts of nationalism, such as those offered by Ernest Gellner, for whom nationalism is a political principle that holds that the political and national unit should be congruent, are inadequate—either because they include too much, or because, as in the case of Gellner (Nations and Nationalism, 1983), they associate it with a particular set of demands or principles. Nationalism, according to Margaret Moore, should be understood as "a normative argument that confers moral value on national membership, and on the past and future existence of the nation, and identifies the nation with a particular homeland or part of the globe" (p. 5). Once we have understood this, we will be in a better position to understand the key policies and demands of nationalists, including their occasional (and only occasional) demands for national self-determination, and to understand the normative limits of nationalism. And we will then be in a better position to understand the nature, and defensibility, of national selfdetermination, and of secession in particular.

The argument developed in this carefully constructed work is, ultimately, a defense of the institutional recognition of national identities. Moore's contention is that nations are moral communities characterized by bonds of solidarity and mutual trust, and that the attachment people feel to such communities is good reason to recognize national identity. But this requires a shift away from seeing nations as grounded in culture (as suggested by liberal nationalists, such as Yael Tamir, Joseph Raz, and Will Kymlicka)—for national identity should not be confounded with a common culture. Nationalists are concerned with preserving political communities, through the protection of jurisdiction, but this does not mean that they seek to preserve their cultures. This requires not the congruence of nation and state, but states that enable nationalist aspirations to be fulfilled—in part at least because they enable communities of identity to flourish. What is required is a state in which the different communities that comprise it cooperate with, rather than seek to control, one another. Equally required is the development of national and international institutions to uphold rights of self-determination. But, crucially, these would have to be institutions that upheld not so much particular norms of justice by which selfdetermination would be permitted, as procedure by which the legitimacy of a national community could be settled. The right to self-determination depends not upon the national community having the right values but upon its having its own identity—and one it seeks to preserve.

This is an argument of considerable merit, offered in a work that is as philosophically subtle as it is historically and politically well informed. The author engages with many of the major modern contributors to the literature on nationalism and secession, from David Miller (On Nationality, 1995) to Allen Buchanan (Secession, 1991), and offers criticism which is acute, and sometimes insightful—though always careful and fair.

Nonetheless, this does not mean that there is nothing in the book with which to take issue. One particular conclusion the author tries to defend that gives rise to a number of concerns is the constitutional right to self-determination. While attempting to strike a balance between institutional arrangements that make secession too easy and others that make it too difficult, Moore argues that a "constitutional right to self-determination, including a right to secession, is necessary because we do not want to trap minorities in states that they do not identify with or regard as legitimate" (p. 218). While this expresses what is surely a laudable principle (and one with which I have considerable sympathy), there is also the issue of the implications of such a principle for some states. Moore's contention is that not only would a right of secession clause in a state's constitution help guarantee

minority aspirations, but it would also offer the state "the best mechanism that [it] could employ to ensure the territorial integrity of the state" (p. 219).

Yet if we consider the case of Kashmir, a very different implication of a right to secession presents itself. Kashmir. as India's only Muslim-majority state, is not only dominated by a vigorous and violent independence movement but is also claimed by Pakistan—which asserts precisely the principle of self-determination that Moore defends. The advantage for Pakistan of any attempt to establish the wishes of the Kashmiris is that Kashmir may not only leave India but also fall under Pakistan's sphere of influence. (There is even a remote possibility of Kashmir's irredentists succeeding in reuniting the province with Pakistan.) The disadvantage to India is not only the loss of territory, or even the encouragement this might give to secessionists in other regions, particularly in the Punjab, but the threat to civil peace within India. Indian Muslims would now be in an even smaller minority, and very possibly the targets of nationalist, anti-Muslim, resentment. At worst, this could mean a bloodbath. If so, the best solution might be one that made the claims of would-be secessionists more ambiguous or uncertain. Drawing clear lines demarcating rights in international law may make it more, rather than less, difficult to resolve complex matters by political accommodations.

To suggest this is not to argue that the principles Moore defends are wrong, only that a clarification of ethical principles may not imply that any particular institutional conclusions follow. Or that institutional reform is desirable. That said, however, it would only be fair to point out that such practical political issues are raised by Moore in a final chapter that is self-consciously "speculative." While there is much to dispute or argue about in these pages, this is a mark of the author's boldness, rather than an indicator of any sort of naïveté. Anyone coming for the first time to the issue of the morality of nationalism would do well to begin with this work. Scholars already working in the field will find it a valuable and challenging contribution to their discussions.

Conscience and Community: Revisiting Toleration and Religious Dissent in Early Modern England and America By Andrew R. Murphy. University Park: Pennsylvania State University Press, 2001. 337p. \$45.00.

Patrick Neal, University of Vermont

Political theorists interested in liberalism often fall into one of two quite different camps. There are those (call them the "analytic" school) who engage in arguments designed to justify or criticize various accounts of justice, legitimacy, and the like, and on the other hand, there are those (call them the "historical" school) who aim at providing a rich historical account of the processes through which such concepts developed in the modern age. Rawls and Dworkin as opposed to Pocock and Skinner, if you will. In my view, the most interesting and ultimately fruitful work in political theory is done by those who practice a mixture of the two approaches. Two prime examples would be Jeremy Waldron and Charles Taylor. Andrew Murphy's first book is a highly interesting and very promising exemplar of this mixed approach. I have no doubt but that "pure" historians will question the novelty of his account of arguments over toleration in the seventeenth century, or that "pure" analysts will question the relevance of that account to the more analytical positions with regard to the contemporary concerns he stakes out in the latter portion of the book. But I found it to be one of the great strengths of his book that he does try to look at contemporary issues with an eye toward the historical context out of which they

emerged. I found my own understanding of contemporary normative arguments about toleration, religious freedom, and liberal public reason enriched and deepened by a reading of Murphy's clear and lively account of the seventeenthcentury arguments.

Murphy's book is divided into two parts. The first, much longer, part is the historical account of arguments for and against religious toleration in three particular cases. They are Massachusetts Bay, Pennsylvania, and England from the Civil War through the Glorious Revolution. In the second, much briefer, part, Murphy calls into question a number of features of contemporary liberal theory, especially in the person of John Rawls, in light of the earlier historical account. He is highly critical of Rawls's account of public reason in political liberalism, seeing it as more of a betrayal than an extension of the tradition of freedom of conscience begun in the seventeenth century. He is also skeptical of the idea that contemporary demands for equal recognition through the language of identity politics can be derived from or made compatible with the structure of the traditional liberal account of freedom of conscience. Without necessarily criticizing the appeals for equal recognition, Murphy usefully and persuasively shows that such appeals cannot be rightly seen as mere extensions of the right to conscience and toleration developed through the crucible of seventeenth-century politics. Indeed, as he shows, there is a deep analytical tension between the more or less negative quality of freedom from governmental coercion claimed by the traditional appeal to the right of religious conscience and the somewhat more positive notion of freedom presupposed in numerous contemporary calls for equal recognition and the affirmation of difference as such. I took Murphy's argument to demonstrate once again the truth of Isaiah Berlin's view that however much we may wish to believe that all good things are co-possible without loss, the truth is that liberty is not equality, and that sometimes they must conflict with one another.

In the historical sections of the book, Murphy emphasizes the way in which the practice of toleration gradually emerged as a consequence of particular historical events and pragmatic political choices (with sometimes unintended consequences) in various contexts. His aim is to undermine the idea that the rise of toleration as a practice manifested the unfolding of an ideal of liberalism that has reached its teleological culmination in our present era. Murphy's account of the often ironic twists and turns of actual seventeenth-century controversies is designed to reveal the oversimplification of such a Whig interpretation of the history of liberalism. His account also brings out the intensely religious character of so much of the seventeenth-century debate over toleration on both sides of the issue, a fact that challenges the idea that the toleration debate was simply one between enlightened, secular liberals and regressive, conservative Christians. In the course of articulating his historical account, Murphy does a very good job of bringing out the considerable force of the antitolerationist arguments in these controversies. It is easy today to dismiss the antitolerationists in Massachusetts, Pennsylvania, and England as nothing more than irrational barriers in the way of progress, but Murphy persuades that concerns for basic order and about the politically destabilizing possibilities of religious dissent in the early modern age were no mere pretenses for the exercise of selfish state power. Thus, for example, he is able to acknowledge the courage and historical significance of Roger Williams and Anne Hutchinson without having to make John Cotton and the other Massachusetts Bay leaders appear merely as cardboard villains.

It is common in the literature of political theory now to see toleration dismissed as "mere" toleration, and to see the pragmatic idea of a modus vivendi political arrangement that secures peace among groups with different modes of life treated as the poor relation to a more elevated ideal of political consensus built upon either moral consensus (communitarianism) or at least an overlapping consensus of similar moralities/religions (Rawls's political liberalism). Murphy does not seek to debunk these higher ideals, but he does try to remind us that it is practically imprudent, not to say foolish, to denigrate toleration and modus vivendi politics for falling short of those ideals, not least because the very possibility of the ideals is built upon the practical foundation provided by them. I think Murphy is right to think that the emergence of toleration in the seventeenth century was not the nascent beginning of a necessary process whose glory is abundant today, but a contingent achievement of both good fortune and political skill, an inheritance that we are fortunate to have been bequeathed and which we would do well to take better care of.

Forms of Power By Gianfranco Poggi. Cambridge: Blackwell, 2001. 256p. \$66.95 cloth, \$28.95 paper.

Regina F. Titunik, University of Hawaii at Hilo

The main themes of this book are prefigured in Gianfranco Poggi's two significant earlier works on the rise and character of the modern state: The Development of the Modern State: A Sociological Introduction, 1978, and The State: Its Nature, Development, and Prospects, 1990, (especially in the first chapter of the latter). In connection with his discussion of state formation, Poggi put forward the view that political power is one particular form of social power and is distinguished from other types of social power by its control of the means of violence. In the current work, Poggi undertakes the considerable task of explicating power in its various forms. He abstracts the concept of power from the historical context of his previous works and, with characteristic lucidity, details the various forms of social power and their interrelations.

Poggi distinguishes three forms of social power—political, ideological/normative, and economic. This tripartite division of social power recalls Max Weber's distinction of "class, status and party" and other similar conceptualizations of a trinity of power forms reflecting the physical, psychical, and material needs of human beings. Indeed, Poggi readily adopts this familiar and useful tripartite formulation and rests his particular distinctions on the kinds of resources that are controlled by power holders, that is, wealth, status, and rulership.

In the broadest sense, power, for Poggi, signifies the human ability to "make a difference" to the world (p. 3). Human beings necessarily transform external nature in order to sustain their existence (and are in turn transformed by the results of their activities). Social power is recognizable when this ability to make a difference is used "in order to control the ability to make a difference that another individual possesses qua human" (p. 9). Poggi examines the political, ideological/normative, and economic expressions of social power successively and considers the interactions between the latter two forms and political power. He also adds a concluding chapter on military power, which, though an aspect of political power, has become sufficiently distinct from other aspects of the political system to warrant separate consideration.

Political power, which represents the constant "point of reference" (p. 29) of the work, involves the threat of violence and the arousal of fear. This form of social power most starkly manifests the phenomenon of power insofar as the deepest human vulnerabilities are evoked and exploited—though, as was indicated by Thomas Hobbes (and is emphasized by Poggi), violence is threatened and fear "awakened" precisely in order to control violence and assuage fear.

It is through the exercise of political power, Poggi intriguingly observes, that the tension between equality and inequality becomes especially pronounced. All forms of social power, he thinks, necessarily embody a tension between basic human equality, on the one hand, and the asymmetries produced by power relationships, on the other. Social power, as indicated, involves making use of another human being's power to "make a difference." The power holder does not aim to extirpate or crush the human powers of the subordinate, but rather seeks to direct those powers to serve his or her own ends. Paradoxically, however, by endeavoring to control the other's uniquely human power to make a difference, the equal humanity of the other is implicitly recognized. One of the primary acts through which political power is deployed—communication of command—particularly exposes this paradox because the act of command relies on the equal humanity of the underling. The subordinate party is expected to understand (p. 32) the command. The act of command—albeit backed by the "or else" of force (p. 30)presumes a basic commonality between the subordinate and superordinate parties, a commonality or equality that necessitates elaborate justifications of the inequalities sustained by political power. Economic power, by contrast, operates not by issuing commands; it directs action by using constraints in such a way that the individual, still pursuing his or her own designs, is compelled to follow one path rather than another and thus "advance the power holder's interests" (p. 123). In view of the evident difference between political and economic power, an argument has been made that there is really "no such thing as economic power proper" (p. 125). Consistent with his overriding idea that political power is only one form of social power, Poggi convincingly refutes this argument with the recurring view that access to and control of resources is decisive in identifying the exercise of power.

Since human beings "make a difference" and are artificers of their own conditions of existence, a profound insecurity about the ultimate foundations of existence necessarily arises. Wielders of ideological/normative power control the resources of ideas and meaning that assuage this human anxiety, but, not unlike in the case of political power, also arouse this insecurity in order to be in a position to continuously relieve it. Religious power is the prime manifestation of this kind of power that controls and dispenses longedfor meaning. Creative intellectuals also provide cognitive maps that make needed sense of the world. Both forms of ideological/normative power benefit political power when their apparent access to spiritual and ultimate forces is used to exalt the political realm and cover it with a kind of sublimity. Bearers of ideological/normative power, in turn, benefit from support and other resources provided by political powers. It is important to note, however, that while various forms of power enter into mutually beneficial relationships, no harmonious reconciliation of these forms of power, according to Poggi, takes place. Competition and struggle characterize their dynamic interrelations.

Max Weber and Thomas Hobbes represent the most notable intellectual influences on this study. (Hegel, it seems to me, is also a presence, though his relevant account of the contradictions inherent in the "master/slave" relationship, among other things, is not cited.) Like Hobbes, Poggi affirms the fundamental equality of human beings. This view of the basic equality of human beings as the proper starting point for understanding political power is also shared by Max Weber (though this aspect of Weber's thought is insufficiently appreciated by many commentators). Weber, and Poggi following him, hold that political power, however necessary, is "artificially established" (p. 49) and thus represents a deviation from the more real, equal condition of

human beings. Because the power relationship is an aberrant condition, it requires "justification" or, in Weber's terms, "legitimation." While Poggi's arguments for seeing equality as the basic human condition are compelling, the notion of political power as "imposition" is, arguably, too narrow. It may be that political power, in the form of leadership, is sought out by the potential subordinates in order to pursue collective projects more effectively. This idea is only briefly considered by Poggi (pp. 49–53) and is, in my view, not adequately stated or refuted. The fact that the powerful have different interests from the powerless and often do not serve the collective good (p. 52) does not disprove the idea that human beings may naturally seek to set up and follow leaders.

This is an ambitious work that deals in an illuminating and comprehensive way with a notoriously difficult concept. Given the scope and complexity of the project, it is perhaps unfair to raise objections about what might have been covered more extensively. Still, I will note one significant issue that lingers on the edges of the exposition, demanding fuller attention. There is a diachronic dimension intrinsic to forms of social power and their interrelations, which Poggi clearly indicates by identifying some recent trends—globalization, for example—that change the relations between and within forms of power. The historical changes in the forms of power account for the necessity of distinguishing military power for separate consideration. Over time, the warrior has become disassociated from the political leader, a process that Poggi characterizes as the "civilianization' of government" (p. 46). Since, at present, one organizational segment—the military controls the implements of violent force, this group develops separate interests and enters into competitive and conflictual relations with other parts of the political system (p. 183). In the tradition of pluralist liberalism, Poggi generally prizes the conflict between and within forms of power and is anxious that, in the future, some forms of social power may be eliminated or various forms of power will be consolidated into a single hierarchy (p. 204). What I miss is a fuller account of how the institutional embodiments of social power are differentiated over time and of the broad mechanisms that account for the prospect that this process may reverse itself and the power forms merge into a hierarchy. In effect, I miss the elucidation of historical patterns that Poggi so ably accomplished in his previous works. But this is only a minor observation about what is altogether an important and impressive work.

Value, Respect, and Attachment By Joseph Raz. Cambridge: Cambridge University Press, 2001. 186p. \$55.00 cloth, \$19.00 paper.

William Corlett, Bates College

Widely known for the challenges he poses for the excesses of "me-first" individualism loosely associated with contemporary Western liberalism, Joseph Raz has grown accustomed to plumbing its depths for signs of humanity and goodness. His new book approaches the twin problem of pursuing universal values while acknowledging particularistic cultures, through a window opened in *Engaging Reason* (1999), where he unpacks the complexity of a "value-reason nexus" to conclude that valuable options are often pursued for incommensurate reasons. In what sense, he now asks, can this "nexus" be said to be universal? At the heart of this project lies an attempt to extend his earlier analysis of value in two related directions: toward human attachments, where Raz must show that particular engagements with value need not fly in the face of universality, and toward an abstract approach to universal respect, which nevertheless remains part and parcel of our contingent attachments.

Raz offers a delightfully accessible opening chapter that embraces both sides of the tension between universal and particular approaches to value. The attachments one forges with others are universal in the sense that everyone can in principle rely upon them and particularistic in the sense that one's attachments are one's own. This double suggestionthat value is "neither and both" self-created and immutableis explored in greater depth in the second chapter, where Raz tightens the knot between contingent human attachments and value's universality. He writes in ways that are determined to show that "reconciliation is possible" (p. 74). After defining value in an "inflationary" sense as "any property which (necessarily) makes anything which possesses it good (or bad) at least to a degree" (p. 43), Raz turns his back on attempts to unearth value's universality by bringing "to light a general feature of all values" (p. 59) and looks instead at approaching the universality of value through a "rejection of those false values about which rage past or present moral struggles" (p. 59). Objectivity begins to require an avoidance of wrongdoing instead of a pursuit of an immutable truth. Raz put it like this: "Since values are objective, they cannot be independent of social conditions" (p. 62), which leads him to suggest that contingency sets "a limit to the intelligibility of value" (p. 76). But if there is an "element of pure contingency at the heart of values" (p. 76), then Raz will have to show how it makes sense to speak of value's universality without relying on an Archimedean point or even a loosely overlapping consensus.

This he prepares to do in the third chapter, which works both to reinforce the point that universal values depend upon social relations and to set the stage for establishing the sense of universality that can survive this kind of social dependence. Raz accomplishes the first task by contesting the popular claim that human life has "an unconditional and non-derivative value" (p. 115). Arguing instead that our lives bear conditional value—that is, that they "are good because something else is, when the relationship between them is a necessary relationship" (p. 77n)—he needs here to distinguish "the value of people from the value of their remaining alive" (p. 115n). Setting aside the (intrinsic) value of life itself, Raz makes what we do or could do with our lives a fundamental part of why we value them. And so the stage is set for discussing the value of people.

But not so fast. Although he is prepared to argue that "respect for people... is a central moral duty" (p. 125), Raz's approach to universality requires spending more time with the abstraction "respect" than with real people, at least at first. By connecting the second chapter's inflationary sense of value to reasons for one's duty to respect what is valuable—for example, each other-the fourth chapter moves well beyond the way Raz views respect in Morality of Freedom (1986). Raz opens by isolating Kant's categorical approach to respect from its familiar housing in a phenomenal-noumenal binary, but remains sufficiently Kantian to claim that moral law is the object of respect; he quotes Kant as saying "the object of respect is, therefore, nothing but the law.... All respect for a person is properly only respect for the law (of honesty, etc.) of which the person provides an example" (p. 135). On this basis, Raz moves to distinguish the theoretical construct of a value in itself—a person, for example—from the more popular notion of treating people as ends in themselves and never as means, a distinction that even Kant, he explains, sometimes conflated.

Raz next advances "three stages of correct response to value": first, "psychological acknowledgment" of what is valuable and, relatedly, "expression of recognition of value in language"; second, "preserve what is of value"; and third, "engage with value in appropriate ways" (pp. 161–62). The

first two ways of relating to what is valuable—respecting it—are required universally to avoid moral wrongdoing, whereas the latter—engaging with it—is optional and thereby subject to contingencies. Even though "ultimately, our lives are about engaging with value," respect "is the right reaction to what is of value even when you do not value it" (p. 164).

Raz can finally apply his value-reason model to human beings. One has a duty to the moral law to respect fellow human beings. But there is plenty of room left at the third stage of the model for attachments in the world of contingency. One is doing wrong, for example, by denigrating a person from a different culture or failing to preserve it, but continuing to identify with an inherited culture is entirely optional. In the end, we begin to realize that respecting other people is good for those who do so. In a nutshell, Raz argues that "foundational moral values are universally valid in abstract form but they manifest themselves in ways which are socially dependent, and become accessible to us in ways which are socially dependent" (p. 8).

Those concerned with Western liberalism—whether critic, vanguard, or apologist-ignore the careful work of Joseph Raz at their peril. Readers new to Raz may find this newest volume a useful point of access before studying his more technical arguments. Those familiar with his work will certainly want to study his new distinction between the avoidance of wrongdoing and more optional life choices. And yet because this provocative work makes the autonomous agent its unit of analysis—in a sort of me-first methodology—respect for and engagement with others add to the risk of sliding back into precisely the individualism Raz seeks to enrich. This backsliding may reinforce his liberal credentials with some readers, but it stands at odds with his promising critique of excessive individualism. If the liberal tradition is ever to set its sights on what Iris Young's (2000) Inclusion and Democracy continues to call domination, it will have at least to begin defending its habit of methodological individualism. This requires engaging with the work of those less comfortable with (nonrelational) autonomy as a starting point. Raz's newest work on respect would have benefited, I think, from a studied engagement with the work of some "unusual subjects"-for example, Marilyn Frye's loving perspective (The Politics of Reality, 1983) or Young's democracy. Perhaps the most significant obstacle to a politics of respectful inclusion is a studied reluctance, when selecting "one's" unit of analysis, reviewing the relevant literature, and constructing abstract categories, to foreground and not lightly pass over the fact that we are always already in this life together.

Making Babies, Making Families: What Matters Most in an Age of Reproductive Technologies, Surrogacy, Adoption, and Same-Sex and Unwed Parents By Mary Lyndon Shanley. Boston: Beacon Press, 2001. 206p. \$27.00.

Julie Novkov, University of Oregon

Mary Lyndon Shanley's Making Babies, Making Families bravely wades into the difficult ethical questions of accommodating new reproductive technologies and diverse family arrangements within the framework of existing and possible liberal legal principles. The book grapples with definitions of parenthood and parental rights in the contexts of adoption, unwed fatherhood, gamete transfer, surrogate motherhood, and multiple parenting within the lesbian, gay, bisexual and transgender (LGBT) community. Shanley mines these situations in order to derive some workable ethical and legal guidelines for the state's exercise of its regulatory capacities with respect to families. In doing so, she reveals the tensions and possibilities inherent in the state's role in defining families at

a moment when many perceive traditional family structures as collapsing, for better or for worse.

For the reader interested in the policy-based bottom line, Shanley provides ample food for thought. Among other policies, she argues in favor of facilitating open and transracial adoptions, undermining the promotion of "as if" adoptive families (families that look and behave structurally as if the children were the biological offspring of their parents). In disputes between unwed biological fathers and other claimants to parenthood, she advocates focusing on the relational aspects of parenthood, in lieu of complete reliance on genetic ties. She argues strenuously against permitting the marketing of gametes, claiming that such a market represents an illegitimate extension of capitalist principles into an area ill-suited for their articulation, and that it has significant potential for racial and class-based exploitation. She objects to legal decisions enforcing contracts against surrogate mothers who decide after giving birth that they do not wish to relinquish their babies, although she would permit individuals to form such contracts. Finally, she recommends centering the child's standpoint and needs in untangling sticky question of custody and visitation arising in the context of "queer" families.

The point of her book, however, is as much how she reaches these conclusions as the conclusions themselves. She opens the book with the claim that "the traditional fabric of family law is unraveling," attributing this problem to rapid transformations in family relationships (p. 1). The argument of the book, however, seems to be more that the problem is located at the interface of law and family relationships. The problematic principles that she identifies repeatedly within contemporary family law are the extension of market forces into the family, the legal commitment to models of extreme individualistic liberties and rights within family disputes, and the near exclusion of considerations of children's needs and perspectives. She argues for supplementing or replacing these principles with factors derived from modern feminist theories of justice. These factors include meaningful equality for women (defined as a recognition of women's unequal status in the family, the workplace, and in civil society more generally), the significance of relationships and care as well as individual rights and liberties, and the centering of children in the disputes that swirl around them. Her work thus incorporates feminist critique and vision as grounding in order to derive concrete answers to tough policy questions.

The scope of the book and its elegant argumentation are striking. Any one of these topics could command a lengthy analysis, but by considering all together, Shanley is able to develop a more unified critique and set of positive principles than she could otherwise provide. Moreover, she does not present her prescriptions as ideal and perfectly just solutions, recognizing the pain inherent in these questions. She seems to see her task as that of taming the tangled network of relationships into recognizable legal statuses that will produce more just outcomes than those that modern family law is currently providing. She consciously places herself with the strand of feminist thinking that emphasizes experiential theory and the centering of relationships in place of celebrations of individual liberal autonomy. These commitments both make her work more grounded and underline her insistence that a onesize-fits-all appraoch to family law will not produce justice.

One might question, however, Shanley's background assumptions about why this crisis has emerged now. She clearly wants to reject the traditional patriarchal conception of the family as wage-earning male married to nurturing female living together with their mutually dependent biological children. She does not go far enough, however, in emphasizing the extent to which this model of family life did not represent reality for many families in the past and does not for

contemporary families. Multiple caretakers, ranging from grandmothers and other adult relations to associates within ethnic enclaves to slave laborers and paid workers to older siblings, have provided nurturance for young children. Families freely opened their homes to orphans and children whose parents could not take care of them. What is at least somewhat new is the extent to which the law has become the means through which family relationship are not only legitimized but also constituted. Historical research on the family suggests, for instance, that the legal formalization of adoption as the primary means of adding a nonbiological child to a biologically related family is a relatively recent phenomenon (see, e.g., Michael Grossberg, Governing the Hearth, 1985). This reading of the problem as a collision between historical practice and legal formulations also emphasizes the need for legal change but suggests that the problem itself is neither new nor primarily one of accommodating new reproductive technologies and family forms in the law.

One might also question some of Shanley's proposals. Most notably, will merely allowing children the right to know basic information about their biological roots really achieve a meaningful centering of children's needs and interests? In practice, such a reform could easily fall short of accomplishing any major reframings of children's positions with respect to the law, becoming merely another procedural requirement with little ultimate significance. Likewise, while Shanley is surely right to require the taking of children's needs into account, this approach cannot lead to results that are universally generalizable or painless for children and those who wish to parent them.

Nonetheless, Shanley's approach of centering children has the potential to change the way we think about family law and the regulation of relationships in positive and significant ways. The book is thus a major accomplishment in terms of both its potential for shaping policies and its significance as a work of applied feminist ethics.

Body/Politics: Studies in Reproduction, Production, and (Re)Construction By Thomas C. Shevory. Westport, CT: Praeger, 2000. 249p. \$59.95.

Robert H. Blank, Brunel University

Body/Politics is a well-researched book that brings together a significant range of topics to explicate the connections between changes occurring with the biological body and within body politics. The theoretical structure of the book is Marxist/ feminist with heavy reliance on critical theory for Thomas Shevory's legal analysis in some of the chapters. According to the author, the central thesis of the book is that "the process of technological change will be creatively destructive, opening new avenues for equality, diversity, self-expression, resistance to hierarchy and control, while also offering new means for domination, exploitation, oppression, and dehumanization" (p. 3). He thus rejects the more extreme stances of the "technoprogressives" who see nothing but good and the "technophobes" who see nothing but bad coming from these developments. He argues quite convincingly that the historical processes we face through these technological changes are dialectical and thus subject to human political intervention. In other words, if we so choose, we do have the capacity to shape technologies, though it is far from clear that we now actually have the will to do so.

Shevory is largely successful in meeting his stated aim of showing how contradictions within the current system of production manifest themselves in particular technological and ideological contexts. He is, however, less successful in meeting a second aim of providing "a form of resistance to a resurgent right, bent on sacrificing public and natural spaces in favor of short-term and shortsighted economic benefits" (p. 11). His analysis of schizophrenic Right with the "cyber" right faction of Gingrich on one side and the "patriot" right wing on the other, as reflected in their responses to new interventions in reproduction and resulting expansions in the domain of property and commodification, is interesting, although one could likely come up with similar conclusions about the political Left, feminists, and others. As the author himself clearly demonstrates, the issues raised by these new forays into modifying the human biology represent fundamental transformations in the way we think about our bodies, our rights, our property, and politics, and if so, I would argue they are thus unlikely to impact only on one segment of the political spectrum.

In order to argue his case, Shevory presents relatively detailed, and in some areas highly technical, case studies on such topics as surrogacy contracts, frozen embryos, the environment, biotechnology, and cosmetic surgery and other changes in appearance. Through these case studies he largely succeeds in his goal of providing concrete evidence of how body technologies are socially constructed and how they, in turn, have the power to reconstruct ideological positions and political practices. Although there is little new substantively in most of these chapters, together they do clarify the author's arguments and at the same time make for interesting reading, especially for readers who might not have had previous exposure to the material they cover. The chapter on (re)constructions of appearance, especially, I found most insightful, and I agree with Shevory that the virtual absence of this topic in the mainstream bioethics or public policy lit-

Most of the case chapters provide detailed conceptual and legal analysis. The discussions of rights in the chapters on surrogacy contracts and frozen embryos demonstrate the futility we face when attempting to create an abstract set of rights claims and the insurmountable problems that result when we try to reconcile such concepts within the context of these new technological capabilities. Likewise, the discussion in Chapter 6 of the changing conceptions of property brought about by biotechnology shows how property rights are continuing to subsume ever larger shares of life, thus leading Shevory to conclude that it is possible that someday everything will simply become property.

Unfortunately, as with many books published today, this book suffers from a lack of a rigorous copyediting process. Among the many coherence-type problems I found was the tendency not to follow through on lists of points. On page 65, for instance, the author says he will argue that surrogacy does this for several reasons, then states "First" but no others. Similarly, on page 69, he states that Raymond has criticized surrogacy on "four grounds: First"—but no Second, and so on. While these might be minor points, cumulatively to a reader such gaps are difficult to follow and frustrating, and they do divert attention from the author's arguments.

Another point of concern, which might also be related to editing at a different level, is that some of the case study chapters do not seem to be shaped by the themes of the book. Chapter 5, especially, seems out of place here. The book has the appearance of an attempt to fit separately written pieces into the whole after the fact with mixed results. Although I believe the author has done a relatively good job in tracing his argument and themes across the chapters, in some places it appears forced, and there remains a considerable unevenness in the book.

These caveats aside, *Body/Politics*, like its title, is an intriguing book that should be of potential interest to readers in political theory, public policy, and American politics. The

analysis is sound and in places highly detailed. Whether the reader agrees or disagrees with Shevory's specific conclusions (and I tend to agree), the discussion represents a competent analysis of an area that strikes at the heart of what we are, both as individuals and as members of society. As such, this book is a valuable contribution to a debate that might now be simmering but that in the near future is likely to reach the boiling point.

Revaluing Ethics: Aristotle's Dialectical Pedagogy By Thomas W. Smith. Albany: State University of New York Press, 2001. 325p. \$75.50 cloth, \$25.95 paper.

Jacob Howland, University of Tulsa

Like Socrates, Thomas Smith's Aristotle practices philosophy as a way of life. The *Nicomachean Ethics* is Aristotle's protreptic and therapeutic introduction to this way of life. It is not a didactic treatise but a teaching that aims at the improvement of its readers' souls. It therefore begins from reputable opinions (*endoxa*) and employs dialectical arguments—not the best arguments simply, but the best available for improving the lives of Aristotle's audience.

This approach to the *Ethics* has much to recommend it. It offers the most compelling explanation I have seen of the text's many contradictions. Smith shows that these contradictions (e.g., regarding whether virtue is one or many, whether honor or friendship is the greatest external good, or whether shame is a virtue) have a twofold root. First, dialectical pedagogy necessarily involves contradiction because it begins with inadequate opinions and moves toward more adequate modes of understanding. Second, endoxa are intrinsically contradictory because they always reflect an incomplete sense of human flourishing. Smith is especially attuned to this problem because he reads the Ethics with an eye to Aristotle's political thought. Our souls have already been formed by the regimes in which we have been raised. But because all actual regimes "are more or less defective and exhibit a partial sense of human excellence" (p. 17), Aristotle must confront what Smith calls the problem of "prior deformation."

What, then, are the guiding assumptions of Aristotle's audience? Smith approaches this question in Part I of his book. He argues that the *Ethics* is aimed at men who love not virtue but "noble action." For these men, nobility entails "a shining vitality that demands recognition by others" (p. 35). Their upbringing has led them to pursue what Smith calls "virtue-asvirility," and to valorize honorable actions and political power rather than moral virtue. This description of Aristotle's audience makes sense: What spirited young Greek could remain unmoved by the example of Achilles? And as Smith observes, it is Aristotle himself who, in the course of criticizing the devotion to honor and power (NE 1.5), first presents virtue as a candidate for happiness.

If Smith is correct, Aristotle is in his own way engaged in what Plato calls the "ancient quarrel between philosophy and poetry" (Republic 607b). His audience consists of risk takers whose love of noble action leads them to compete for zero-sum goods like honor, power, and wealth. Aristotle's task in the Ethics is to lead his readers from virtue-as-virility toward "virtue-as-equity," and to introduce them to sharable goods like friendship and knowledge. This will not be easy, especially because the practice of philosophy may strike readers as useless or even dangerous within the context of zero-sum competition.

In Part II, Smith provides a detailed account of Aristotle's "revaluation" of the virtues in the *Ethics*. The distinction in Book 1 between moral and intellectual virtue, as well as more specific distinctions between individual moral virtues, are not

Aristotle's own. Here again, Aristotle follows the endoxa, which undervalue the importance of thought with respect to action. Smith's analysis of the treatment of specific moral virtues in Books 3 through 5 of the *Ethics* accordingly aims to disclose Aristotle's dialectical attempt to transform reputable opinion in preparation for his reconsideration, in Book 6, of the role of thought in virtuous action.

Smith emphasizes the implicit yet essential role of thought in the virtues Aristotle discusses. The magnificent man, for example, is celebrated as much for his ability to judge what is needed by his community as for his openhandedness. What passes for generosity is furthermore most often an excessive attachment to external goods. (Contra Smith, however, excessive or extravagant gift giving must still be regarded as a vice.) In place of generosity as ordinarily understood, Aristotle points toward the spiritual generosity of Socrates. Indeed, Smith suggests that Socrates stands at the mean of other virtues as well, including truthfulness. This seems right, and, if anything, Smith does not develop these insights far enough. He misses Aristotle's suggestion that Socratic thoughtfulness is the key to genuine courage: Compare 1116b4-5 ("Socrates thought courage was knowledge") with the implicit reference to Socrates at 1115a17-18 ("perhaps one should not fear poverty or sickness, or in general anything that does not spring from vice and is not due to oneself").

Smith takes pains to show how Aristotle's account of justice differs from that of modern liberal thinkers. Aristotle's emphasis on the problem of political (de)formation helps us to understand that the liberal ideal of neutrality with respect to individual interests is unattainable. In any case, reflection on the limitations of legal justice discloses the need for the more fundamental virtue of equity (epieikeia). Equity turns out to be more fundamental than justice because "decent laws are precisely the rules of thumb determined by those who possess virtue-as-equity" (p. 153). Like the virtues discussed earlier, equity demands the cultivation of thoughtfulness. By the end of Book 5, then, Aristotle has prepared the reader for a radical reconsideration of the relationship between thought and action.

Aristotle begins this reconsideration in his discussion of practical wisdom or phronesis (the subject of the rest of Part II of Smith's book) and concludes it in his exploration of pleasure, friendship, and philosophy (the subjects of Part III). Phronêsis, Smith argues, does not involve the implementation of an abstractly formulated life-plan. It is rather the essentially "reactive" capacity to "determine the best course of action in the situations that have been handed to us" (p. 170). Because phronêsis involves an awareness of one's own failings and limitations, it opens one up to the satisfactions of friendship or philia (p. 268). Smith brings these insights to bear on the problem posed by Book 10 of the relationship between the life of contemplation and the life of action. We go astray if we approach this problem as a choice between two abstractly formulated life-plans. Phronêsis does not deal in abstractions; it "is actualized precisely when we judge aright amid the complexities of the situation given to us" (p. 258). In any case, contemplation and action are intertwined. Thought informs all action, and life itself is a kind of thoughtful wakefulness that is most fully actualized in the company of friends (pp. 173, 204). For that matter, the Ethics itself is rooted in philia: It is a supremely generous encouragement to the difficult and often misunderstood work of trying to become more virtuous (p. 224).

I have been able in this short review to touch only on the high points of Smith's comprehensive, engaging, and intelligent study. Suffice it to say that *Revaluing Ethics* is an important book from which all serious students of Aristotle's ethics and politics will profit.

The Ship of State: Statecraft and Politics from Ancient Greece to Democratic America By Norma Thompson. New Haven: Yale University Press, 2001. 256p. \$35.00.

Nature, Woman, and the Art of Politics Edited by Eduardo A. Velasquez. Lanham, MD: Rowman & Littlefield Publishers, Inc., 2000. 385p. \$80.00 cloth, \$24.95 paper.

Catherine Zuckert, University of Notre Dame

These books have similar aims and are written from a similar perspective. There are, however, important differences in content, emphasis, and form. Norma Thompson explicitly seeks to show that the Western intellectual tradition is not misogynist. One reason that it is not, she urges, is that it is not univocal. Within the tradition one can find several very different views of the character and relation of men and women. Introducing the volume he edited, Eduardo Velasquez states, "This collection of essays does not purport to give an answer to the question of what are 'nature' and 'woman,' at least not in an immediate, definitive sense. Rather, the comprehensive aim here is to reopen questions as to the 'nature of nature,' the 'nature of woman' with consideration given to the consequences of pairing some understanding of 'nature' with that of 'woman'" (p. xi). A collection of essays necessarily contains a variety of voices.

Thompson's Ship of State is an extended, elegantly written essay that displays great erudition. She covers the entire history of Western political thought—and more than the traditionally recognized theorists—from Homer to Gertrude Stein. She divides her consideration of the understanding of the relation and the significance of the relation between men and women or the masculine and feminine into three periods or "parts" concerning 1) the polis, 2) the state, and 3) democratic America. In her first two chapters, she argues that classical Greek authors saw the need for male and female traits to complement and balance each other in individuals as well as in communities. Homer in the Odyssey depicts such a balance within Odysseus and Penelope as well as in their marriage, Thucydides indicates the importance of the feminine by its absence, Aristotle argues that different individuals should serve the polity by performing different functions, and Plato balances male and female in the contrast between the "male drama" of the Republic and the explicitly feminine characteristics of Socratic philosophy.

Whereas the ancients advocated the need for a balance, Thompson argues, modern political thinkers emphasize the tension between the masculine and the feminine along with other extreme polarities. Machiavelli's works are full of antitheses-between princes and republics, foxes and lions, the great and the people: "What prevents these dichotomies from ensuing in hierarchies? Only subtlety in presentation" (p. 76). Rhetoric thus becomes extremely important to modern political theorists, who seek to find a balanced structure for the increasingly central control exercised over individuals by the state. Thompson defends herself in passing from critics who would accuse her of taking an essentialist view of the masculine and the feminine by pointing out that in her account of modernity, Edmund Burke "stands in as the paradigmatic 'feminine' writer, and Wollstonecraft as the sometimes 'masculine' one" (p. 76). In valorizing complexity and tradition as opposed to the simplicity of principle and the clarity of reason, Burke appears womanish. When Wollstonecraft urges women to become more virtuous, she keeps some of the original meaning and, therefore, the root in the masculine "vir." The tensions emerge full-blown in Mary Shelly's Frankenstein: "On one level of Frankenstein, Mary Shelley issues a feminist critique analogous to Burke's in the Reflections" (p. 105). By creating his monster in the laboratory, Victor Frankstein makes the female unnecessary.

On the other hand, what the monster comes to desire above all is feminine companionship. The balance is obviously awry and things go badly.

Rousseau and Tocqueville both try to right the balance by recognizing the equality of the sexes as parts of the human race, yet trying to reintroduce complementary traits and roles. They do not succeed, Thompson argues, because, in the end, they, their theories, and their writings cannot escape the leveling effects of democracy. Thompson defends Tocqueville from critics who point out that on the basis of his analysis, women never will achieve political or economic equality; he does so by reminding us that Tocqueville argues not for the equality but for the superiority of women: Women virtuously sacrifice themselves and their pleasures, rather than calculating their own interests like the men. Nevertheless, Thompson thinks the distinction Tocqueville attempts to draw between the roles and characters of the two sexes fails. It fails, first. because it is based merely on one passing phase of American history; it fails more fundamentally because he does not have the literary form or talent to resist democratic leveling. He writes a survey. The author who succeeds in establishing an identity for herself that differs from that which her male associates would impose upon her is Gertrude Stein. In praising Stein as the democratic Socrates, Thompson demonstrates that she or her analysis is not essentialist. However, what Thompson means by male and female, or what the forces and functions she thinks need to be distinguished and balanced in a polity are becomes unclear. Is she, in the end, talking about the relation between male and female in the tradition, or the superiority of literary to argumentative forms of writing? She praises literary works because they resist the democratic tendency to level everything and everyone to a common denominator and so to cover over, if not entirely to lose the complexity of, politics. This reader finds it difficult to believe, however, that political problems cannot merely be dramatized or even analyzed but actually solved through fictional works.

The essays in the Velasquez volume each focus on one author, or, in some cases, a few authors. The volume does not have a unifying thesis, although the essays all address a common problem or theme. Some of the authors, for example in the case of Jane Austen, explicitly disagree with each other. (Germaine Paulo Walsh argues that Austen has an Aristotelian view of character, whereas Inger Brodey contends that Austen is closer to Adam Smith.) In this space, I can only mention some of the pieces I found most striking. In the opening essay, Ronna Burger points out that the search for knowledge on the part of the woman apparently condemned in Genesis is what is praised in Socrates. Burger does not, however, consider the potential difference, if not outright contradiction, therefore, in the roots of the Western intellectual tradition. Likewise, Evanthia Speliotis points out that the apparent ground for the superiority of male to female in the household in the first book of Aristotle's Politics, greater physical strength, is the reason for the natural inferiority of the slave. Both of the natural relations in the household, Speliotis argues, are shown to be subpolitical and hence subrational. True political relations among equals involve ruling and being ruled in turn. But does Aristotle ever indicate that women can become citizens? Speliotis does not say. Matthew Crawford raises questions about the adequacy of Plutarch's defense of married love in the face of ancient philosophical pederasty. Melissa Matthes and Arlene Saxonhouse both suggest that the distinctions traditionally drawn between male and female roles and characteristics can be traced to force as much as, if not more than, to nature. Lee Ward disproves claims that John Locke supported a traditional notion of the natural and hence social and political inferiority of women

on the basis of an extraordinarily careful reading of a number of Locke's texts. Deborah Winkle brings out the ambiguous complexities in Rousseau's treatment of the natural, historical, and desirable relation between sexes in much more detail than Thompson. The collection ends with essays by Nicholas Capaldi on liberal political culture (Hegel to Mill), Denise Schaeffer on Nietzsche, Lesley Wheeler on Emily Dickinson, and Marc Conner on Toni Morrison—topics or authors Thompson ignored.

Whether one agrees or disagrees, the arguments presented in both volumes are wide-ranging and thought provoking. Both should be required reading for anyone exploring the basis and implications of sex and gender for human social relations and political order.

Liberalism Beyond Justice: Citizens, Society, and the Boundaries of Political Theory By John Tomasi. Princeton: Princeton University Press, 2001. 163p. \$55.00 cloth, \$15.95 paper.

Stephen L. Newman, York University

In a book published almost a decade ago, Ronald Beiner complained that contemporary liberalism suffers for its neglect of the Big Questions traditionally addressed by political philosophy. Preoccupied with narrowly conceived and highly formal questions of (procedural) justice, liberalism had no advice to give about how one should live. (See Ronald Beiner, What's the Matter with Liberalism, 1992.) John Tomasi's provocative new book takes this complaint seriously and attempts to remedy the defect in contemporary liberalism by moving it "beyond justice" to address the normative concerns of persons earnestly striving to lead good and worthwhile lives.

Tomasi considers modern liberal theory deficient insofar as most contemporary liberal theorists are willing to address social concerns only "in terms of justice and the legitimacy of state coercive action (or in terms of a narrow band of deliberative dispositions—e.g., the much ballyhooed 'sense of justice'—immediately attendant to those concepts)" (p. xv). Hence, an adequate theoretical defence of liberalism is taken to be identical to the project of justifying the authority of the liberal state" (p. xvi). But this narrow theoretical focus ignores the effects that liberal political institutions and practices inevitably have on the ethical outlooks of liberal citizens. Since there is much more to the moral lives of individuals than politics, and because the fit between a diverse citizenry's nonpublic moral views and the principles of political association is important to maintaining the stability of liberal regimes, liberals need to think seriously about why people such as we are would want to live in a society where the goal of contemporary liberalism—democratic justice has been legitimately achieved.

Liberals may be forgiven if they thought that the answer was obvious: Liberal justice offers a neutral political framework within which individuals who cannot agree on the meaning of life are able to live together peaceably, all of them free to pursue their own notions of how best to live (so long as they do not seek to impose their preferred ways of life on one another by force). Tomasi associates this position with "ethical liberalism," which treats the individual as the ultimate arbiter of what gives value to his or her own life. Ethical liberalism is said to rest on a particular conception of human moral personality, one that makes value formation a consequence of the individual's autonomous choices. Importantly, however, the ethical liberal point of view does not go unchallenged in modern society. Tomasi points out that the Romantic tradition is every bit as deeply rooted in Western culture; however, because Romantics do not affirm the normative ideal of individual autonomy, which seems to them a morally pernicious notion, they are hardly likely to accept justificatory political arguments that invoke an autonomy-affirming philosophy of life. Far from providing a neutral political framework, liberal institutions and practices will appear to them as morally subversive agents of change.

Respect for ethical diversity, which Tomasi places at the heart of the liberal principle of legitimacy, requires that all citizens be able to affirm liberal principles of political association for reasons that are fully convincing to them in light of their own more or less comprehensive moral views. In short, consistent liberals cannot require nonliberals to affirm a comprehensive liberal doctrine (such as ethical liberalism) as the price of admission to the liberal state. Tomasi understands Rawls's "political liberalism" as a response to the liberal legitimation crisis. By politicizing justice, i.e., by appealing only to people's shared political beliefs concerning the principles of justice. Rawls avoids having to make any substantive claims about the true moral nature of human beings. Instead, he anchors normative support for liberal justice in an overlapping consensus of moral viewpoints, each of which gives support to liberal political principles for good and sufficient reasons of its own. The only condition political liberalism imposes on citizens is that they "share the moral idea that humans are the kinds of beings who are owed reasons, in terms they themselves can accept, that justify coercive actions undertaken by the state with respect to them" (p. 9). While this limits the applicability of political liberalism to some finite number of social environments where reason-giving is the norm, it does not require any agreement concerning the best good for human beings.

In this sense Rawls succeeds at constructing a neutral scheme of justification; however, Tomasi insists that liberal political institutions and practices are not and cannot be neutral in their effects. This is because the language of liberal public discourse and the requirements of public reason have a tendency to infiltrate what he calls the "ethical background culture" of political liberalism, subtly pushing nonpublic moral beliefs in a liberal direction. He chides Rawls and other political liberals for treating this systemic ethical bias as inconsequential and insists that if political liberalism is to be truly accommodating of ethical diversity (and thus fully legitimate on its own terms), some way must be found of limiting the potentially homogenizing effects of liberal institutions and practices on the nonpublic sphere. It is here that Tomasi's argument is most original, and most controversial. He claims that political liberals have an obligation to be mindful of people's nonpublic moral commitments, which although not any part of public reason are, nonetheless, essential to their making a home in the world and thus immediately connected with their support of liberal institutions and practices.

Significant policy implications flow from this claim. Tomasi advocates that whenever possible public policies should be designed in ways that reduce the unintended effects of liberal justice on some citizens (without, of course, violating the rights of others). For example, liberal educators must be concerned "that they do not send a distorted or misleading message about nonpublic value as they go about preparing students for public life" (p. 93). This may require accommodating parental demands that public school students be educated about (though not in) particular religious traditions and made aware of how it is possible to reconcile political autonomy with their nonpublic moral commitments. More broadly, Tomasi thinks that liberalism needs to cultivate a deeper conception of citizenship, one that emulates the classical model by seeking to integrate the good citizen and the good person. "For any self-aware political liberal, any theory of good citizen conduct must include considerations about the way public values impinge on nonpublic spheres, and how those values can be put to personal uses there.... In a free society, the virtues of good citizens must be the virtues of (diverse) good souls" (p. 71).

Political liberals may not feel comfortable following Tomasi down this path. It is one thing to argue that genuine neutrality requires the liberal state to make reasonable accommodations for the protection of people's nonpublic moral beliefs; it is something else altogether to insist that liberals have an affirmative obligation to foster the nonpublic values that inform a morally diverse people's answers to the Big Questions of life. Political liberals will also find unsettling Tomasi's insistence that the need to accommodate ethical diversity places significant limits on the scope of redistributive social justice. In his view, redistributive measures turn out to have costs paid in terms of "the vanishing social space in which reasonable people might otherwise have perceived and responded to challenges of human social existence on their own, eudaimonistically directed terms" (p. 123). In other words, state intervention to address inequalities that may result from "the normal operation of free institutions" (p. 124) risks interference with the exercise of responsibilities toward others embedded in particular moral traditions. Fairness to these traditions and the ethical diversity they represent, Tomasi argues, reduces the opportunities for "social construction" undertaken in the name of justice. Perhaps. But there is a fine line in his argument between respecting the moral practices of social groups and providing incentives for potentially dissident members to stay where they are. Political liberals may well prefer to err on the side of potential dissidents by supplying them, as a matter of right, with the material resources that would ensure their independence.

**The Cambridge Companion to Hannah Arendt** Edited by Dana Villa. Cambridge: Cambridge University Press, 2001. 320p. \$55.00 cloth, \$20.00 paper.

Jeffrey C. Isaac, Indiana University, Bloomington

This is an excellent collection of essays about the political thought of Hannah Arendt. Its editor, Dana Villa, has assembled a first-rate group of scholars, many of whom are already well known for their contributions to Arendt studies. The volume is distinguished by the high quality of its contributions and by the effort of so many of its contributors to go beyond standard lines of exegesis to raise interesting questions and to press the boundaries of Arendt commentary. Arendt's work has received a great deal of attention from political theorists in recent years. The Cambridge Companion to Hannah Arendt makes clear the richness of her thinking, the range of her concerns, and the ability of her writings to inspire creative commentary and constructive political theory.

The book consists of an Introduction and six thematic sections. In his fine Introduction, Dana Villa offers an overview of Arendt's career and concerns, emphasizing the rootedness of her theorizing in distinctively twentieth-century problems centering around totalitarianism. Villa underscores Arendt's modernism and her continuing relevance to contemporary concerns, themes that recur throughout the volume.

In Part One, "Totalitarianism and Nationalism," Margaret Canovan explores the distinctiveness of Arendt's unconventional account of the totalitarian phenomenon, emphasizing its diabolical and relentless tendency to sweep away human agency; and Ronald Beiner considers Arendt's discussions of different forms of nationalism, pointing out that while Arendt well understood the capacity of nationalism to frustrate human rights and political freedom, she failed to think constructively about political solutions to these problems. In Part Two, "Political Evil and the Holocaust," Seyla Benhabib ana-

lyzes the complexities of Arendt's treatment of Eichmann, and Mary Dietz offers an ingenious account of Arendt's theorizing as a particular kind of response to the traumatic horrors of the Holocaust, focusing on the absence of the Holocaust theme from Arendt's most constructive work of political theory, The Human Condition. While Benhabib emphasizes the lessons Arendt sought to learn from Nazism and the Eichmann trial, Dietz suggests that Arendt's political theory sought a "recreative escape" through the construction of a "powerful imagistic symbol" of heroic action removed from contemporary concerns. Similar themes are broached in Part Three, "Freedom and Political Action," with George Kateb discussing the strengths and weaknesses of Arendt's "heroic" conception of political action, and Jerome Kohn emphasizing the forward-looking character of Arendtian freedom. In Part IV, "Arendt and the Ancients," these themes are pursued from yet another angle, with J. Peter Euben, Jacques Taminaux, and Hauke Brunkhorst interpreting, in different ways, Arendt's reappropriation of ancient Greek and Roman theory and practice.

Part Five, "Revolution and Constitution," is perhaps the most interesting section of all. In it Jeremy Waldron offers a judicious and powerful account of the centrality of institutions to Arendtian politics, and Albrecht Wellmer presents a Habermasian rendering of Arendt's On Revolution, emphasizing the importance to modern politics of moral universalism and technological dynamism-both shortshrifted by Arendt-but also emphasizing the centrality of the political agency and civic responsibility that Arendt gives pride of place. Wellmer and Waldron both insist that Arendtian politics is best understood as a supplement rather than an alternative to liberal democratic institutions. Finally, in Part Six, "Judgment, Philosophy, and Thinking," essays by Maurizio Passerin D'Entreves, Frederick M. Dolan, and Richard J. Bernstein consider Arendt's writings on the various modes of thinking, underscoring in different ways Arendt's emphasis on the importance of intellectual independence and reflexivity in politics. Bernstein's essay, in particular, wrestles with some deep ambiguities in Arendt's corpus, locating a tension between worldliness and solitude in her understanding of "thinking," and linking this to her difficulty in coming to terms with the lessons of the career of her mentor, Martin Heidegger.

Arendt's corpus has exercised an extraordinary hold on the minds of political theorists since her death in 1975. It is hard to generalize about the voluminous Arendt literature, but it is possible to identify distinct lines of argument. If early readings of Arendt often tended to embrace her classicism as a counterweight to the positivistic tendencies of behavioral political science, for the past decade or more, as political theory has come into its own as a field, Arendt has been read against some of the dominant idioms of contemporary political theory itself. This has led to the flourishing of civic republican, Habermasian, Foucauldian, Derridaean, and other readings of Arendt. These readings have allowed scholars to construct fruitful dialogues between Arendt and a range of approaches, in the process fleshing out Arendt and these approaches themselves. The Cambridge Companion to Hannah Arendt builds on this work. But it is also part of a broader recent tendency to move beyond it, following her own admonition to "think without bannisters" and outside of the box. Many of its commentaries are more than commentaries and more than efforts to extend conventional paradigms. They are efforts to probe Arendt in order to pursue difficult and relevant contemporary questions about the political meaning of evil, the nature of political agency, and the possibilities of democratic renewal. To this extent these essays are truly a fine "companion" to Arendt, for they help us not simply to

understand her but to do what she rightly thought we need to do—to think for ourselves about what we are doing.

The Platonic Political Art: A Study of Critical Reason and Democracy By John R. Wallach. University Park: Pennsylvania State University Press, 2001. 468p. \$65.00 cloth, \$25.00 paper.

Aristide Tessitore, Furman University

Not only is the practice of a genuinely Platonic political art compatible with a commitment to democracy, but, according to John Wallach's ambitious book, it furnishes a needed critical resource that can help tap the unfulfilled potential of democracy at the present time. Wallach's unconventional thesis emerges from his critical historicism, a method that attempts to carve a mean between the relatively ahistorical readings of Popper, Strauss, Arendt, Derrida, and Rorty (among others) and the radically historicist readings more typical of classicists and ancient historians (pp. 21-23). Whereas the latter tend to subordinate Plato to the historical and political forces of his time, the widely disparate interpretations of the former cohort view him as either "authoritarian" or radically "self-mocking." In either case, Plato is portrayed as an antagonist to the freedom and equality of democratic life. To release the Platonic political art from the grip of these influential but debilitating interpretations, Wallach seeks to navigate between the ahistorical elevation of theory (logos) and the historicist subordination of theory to practice (ergon), focusing instead on the dissonance of the logos/ergon relation itself.

Wallach explains that Plato's political art was forged in response to a welter of problems concerning power, ethics, and critical discourse in democratic Athens, all of which came to a head in "the honorable yet problematic life, and memory of Socrates," something he dubs "Plato's Socratic Problem" (p. 43). Socrates' failure to reconcile the exercise of virtue with the requirements of political life (depicted especially in the contrasting perspectives of Apology and Crito) became the central feature of Plato's Socratic problem, one that led to a new and distinctively philosophic conceptualization of the political art as an attempt "to understand and promote the potential for harmony between a critical ethics and the power of politics, between the ergon of democracy and the logos of justice" (p. 234).

The longest part of the book is devoted to an elucidation of Plato's political art. Plato begins with critical explorations of Athenian conventions in the aporetic dialogues (culminating in Protagoras and Gorgias), gives comprehensive and positive expression to his art in the Republic, and later applies it to practical themes of political leadership and constitutional law in the Statesman and Laws, respectively. Wallach incorporates generally accepted writing chronologies for the dialogues, but dependence upon theories of Plato's "intellectual development" has been displaced by the centrality of Plato's Socratic problem. The heart of this section-indeed, of the book as a whole—is a 116-page analysis of the Republic. Wallach contends that the Republic is misread when it is taken as a blueprint for political reform or dismissed as merely utopian; the genuinely Platonic connection between logos and ergon resides in the "inevitably problematic effort both to identify genuine justice discursively and philosophically and to exemplify it practically and politically" (p. 311). Moreover, Plato's pursuit of justice is marked by "the persuasion of education" rather than by the coercive or authoritarian imposition of violence. With these arguments in mind, Wallach takes on antidemocratic interpretations of the Republic. He maintains that the dialogue as a whole is not primarily directed against democracy but evidences a more radical project, one that rejects "the necessary connection between any existing political order... and the definition of justice" (p. 279, emphasis added). Rather than provide an ideal resolution for the problem of justice, Plato articulates an enduring problem, one that emerges from his attempt to grapple with the immediate historical conundrums dramatized in his "Socratic problem." It is this dynamic and open-ended interpretation of the Platonic political art that enables Wallach, in the final part of his book, to suggest ways in which that art might benefit contemporary debates about the relationship between critical reason and democracy.

Readers of Wallach's book will encounter an earnest Plato, one ardently devoted to the constructive project defined by his Socratic problem. But it is a Plato without humor and a Socrates stripped of the characteristic irony that both engaged and alienated his contemporaries. Indeed, the only time that irony becomes thematic is on the concluding page, where Wallach rightly notes "the remarkable irony" of his argument: A political art distinguished by its critical stance toward ancient democracy can become a democratic asset in the current postliberal age. Wallach intentionally plays down Socratic or Platonic irony, apparently fearing a movement of interpretative regress that threatens constructive philosophic claims (p. 90). He turns instead to the seemingly more solid ground of history but, in so doing, (ironically) runs the risk of distorting a truth about the historical Socrates that may be inseparable from his critical legacy. With respect to Plato, the possiblity of infinite regress is constrained by the artistry of the dialogue form he helped perfect.

This points to a second lacuna in Wallach's study, the almost complete absence of sensitivity to literary genre. In fact, Wallach wishes to bypass both the vagaries of literary interpretation and the apolitical appropriations of analytical philosophy. His halfway house, however, leans to the analytic side in its neglect of irony and literary drama, something he justifies with the claim that "philosophical arguments...count for more than their embodiment by characters" (p. 90). Dramatic elements are not entirely neglected but are valued as evidence for the historical problems that Plato attempts to resolve (p. 91), an approach that raises a more general question about the adequacy of the critical historicist method itself. Whereas it is readily apparent that our understanding of Plato is enriched by knowledge of history, it is by no means obvious when a particular argument should be considered historically dependent or historically transcending. Wallach invokes the latter perspective in the crucial case, arguing (correctly in my view) that the critical political theory of the Republic was not developed primarily in opposition to Athenian democracy, but with reference to injustices that suffuse "every existing political order" (p. 234). The reader is left to wonder how one ought to distinguish historical contingencies that constrain Plato's formulations from aspects of Plato's art that transcend the particular practical circumstances within which they were originally conceived. This judgment seems no less susceptible to the kind of regress that Wallach decries with respect to interpretations that engage the ironic and/or literary dimensions of Plato's art. Wallach also appears to allow partisan passions to intrude upon his project in a most unPlatonic way. Key points in his interpretation of the Republic (neither blueprint nor utopia; not a critique simply of democratic Athens but of all existing regimes) have been anticipated by Strauss and Bloom, whom he cites only to dismiss, derisively caricaturing their work as antipolitical or conservatively aristocratic.

Notwithstanding these difficulties, Wallach's book is clearly written, encompasses an impressive breadth of historical and

philosophic material, and strenuously engages a mountain of recent and not so recent scholarly debate about Plato. It also contains several subtle and insightful ways of framing particular issues within the *Republic* and relating them to Plato's other dialogues. Those who find Plato's literary genius or use of irony to be inseparable from his political

art will find this book unsatisfying. However, in the measure that Wallach succeeds in problematizing a widespread tendency to read Plato through the analytic or radically historicizing lenses developed especially during the last century, his book deserves serious consideration and makes an important contribution.

## **American Politics**

Black and Multiracial Politics in America Edited by Yvette M. Alex-Assensoh and Lawrence J. Hanks. New York: New York University Press, 2000. 404p. \$55.00 cloth, \$21.00 paper.

Michael K. Brown, University of California, Santa Cruz

The waves of immigrants arriving in the United States over the last 20 years, largely from Latin America and Asia, have settled in a few states—mainly California, New York, Texas, Florida, Illinois, and New Jersey—and in big cities in those states. Like the migration of African Americans to northern cities in the twentieth century and the suburbanization of whites, this demographic transformation is remaking urban politics. Black and Multiracial Politics in America, a collection of original essays, addresses the implications of this change for "the practice and process of black and multiracial politics in American society" (p. xiii). The authors seek to forge a new link between the study of black and the study of multiracial politics.

This anthology is dedicated to the proposition that the black—white paradigm "no longer appropriately characterizes American racial politics." Not all of the essays speak to this question, but those that do raise two important issues. One question concerns the meaning of race in American politics, whether recent demographic changes fundamentally alter the color line. The second question is whether the relationship between the new immigrants and African Americans will turn on conflict or cooperation.

Some of the essays in this book suggest that racial divisions between whites and nonwhites remain salient to American politics despite immigration. Pie-te Lien and Margaret Conway demonstrate that blacks, Latinos, and Asian Americans are all far more likely to support affirmative action, albeit for very different reasons, than whites, who disproportionately oppose such policies. And Pie-te Lien shows that race is still consequential to voting. She writes, "All the nonwhite groups—Asians and Latinos especially—had much lower registration and voting rates than Whites" (p. 207). It is well known that voting rates for Latinos and Asian Americans are much lower than those for other groups because far fewer are eligible to register. Almost half of Asian Americans and two-fifths of Latinos are not citizens and therefore are disqualified. This is changing, particularly in California in the wake of the antiimmigrant ballot initiatives of the 1990s. Even so, racial differences in voting remain after accounting for differences in education, income, marital status, and union membership of eligible voters.

Since race matters for the new immigrants as well as African Americans, the interesting question is whether the divide between whites and nonwhites will lead to multiracial political coalitions or whether competition for resources, access, and political power results in new patterns of ethnic conflict, especially between blacks and the new immigrant groups. If the studies in this book are any guide, the answer

depends as much on how blacks respond to the new immigrants as on the reaction of whites. One factor influencing African Americans' response is the continuing significance of black racial consciousness, particularly a strong nationalist outlook. In one of the most interesting essays in the book, Errol Henderson argues that Black Nationalism waxes or wanes depending on macro political phenomena, specifically war, a repressive political climate, and whether the country is preoccupied with foreign or domestic affairs. Wars sharpen the discrepancy between black sacrifice abroad and oppression at home, inducing African-American militancy and white intransigence. In these circumstances, black leaders championing integration lose out to nationalists.

Henderson's valuable effort to chart the oscillations of Black Nationalism is not wholly convincing, mainly because World War II and the Korean war do not really fit the pattern. There are also secular changes that matter. In their fascinating study of the Million Man March, Joseph McCormick II and Sekou Franklin find that racial consciousness remains the most salient feature of African American political identity today even among putative integrationists. They are far more race conscious than the integrationsts of the pre-1965 era and "far more concerned," McCormick and Franklin write, "with reforming the economic, political, and social order and removing racial impediments to their progress than with mere racial integration per se" (p. 331). McCormick and Franklin think that either black consciousness could lead to efforts to form new political coalitions or it could intensify nationalism and impede the development of nascent multiracial coalitions. Whether it leads to coalitions or to separation depends in part on the ethnic and political consciousness of other groups. Unfortunately, we learn very little in this book about the political identity and consciousness of most Latinos or Asian Americans. This is one of the major weaknesses of the collection.

Several essays address the difficulties of building multiracial coalitions. Raphael Sonenshein argued some time ago that biracial political coalitions depended in part on an alliance between groups who were mutually excluded from political power and influence but who shared political goals and ideology. Blacks, Puerto Ricans, and Afro-Caribbeans all tread the same side of the color line and could be expected to endorse similar policies. For two reasons, however, multiracial coalitions are difficult to build and sustain. One of the paradoxes of contemporary black politics is that African Americans now have political power in many cities but remain a marginal group, victimized by white racism. José E. Cruz found that resentment and racial ambivalence governed the relationship between blacks and Puerto Ricans in Hartford, Connecticut, and frustrated efforts at cooperation. Black elites were reluctant simply to give up power to a new group, who, not surprisingly, insisted on appointing members of their own group to agencies and elected offices.

The other reality shaping the development of multiracial political coalitions is the transnational identity of many of the new immigrants. Whatever ostensible political objectives they might share with blacks, Reuel Rogers argues that

Afro-Caribbean political identity is shaped by a "sojourner mentality [that] fuels the 'myth of return." (p. 39) Maintaining their ties to families and friends in their home countries enables Afro-Caribbeans to think that exit may be preferable to voice. Rogers is right to point out that both pluralists who preach assimilation and those who think that the new immigrants will become just another minority group wrongly ignore the power of a transnational political identity.

This collection of essays could not be timelier. Although some of the studies are peripheral to the major themes and thus less interesting, scholars pondering the implications of recent immigration for ethnic and racial politics would do well to look at this collection of essays.

American Labor Unions in the Electoral Arena By Herbert B. Asher, Eric S. Heberlig, Randall B. Ripley, and Karen Snyder. Lanham, MD: Rowman & Littlefield, 2001. 207p. \$69.00 cloth, \$19.95 paper.

Glenn Perusek, Albion College

For more than a generation, as the authors rightly point out, the impact of organized labor on electoral politics has been neglected in scholarly literature. Indeed, only a tiny minority of social scientists explicitly focuses on organized labor in the United States. Although the impact of the social movements of the 1960s appeared to heighten awareness of the importance of class, race, and gender, class and its organized expression, the union movement, has received less attention, while studies of race and gender have flourished.

Thus, a systematic study of the impact of organized labor upon electoral politics, historically grounded yet centered upon contemporary outcomes and prospects, is to be welcomed. This work, the product of a decade-long study of organized labor in electoral politics, relies on American National Election Studies for national data. But in research funded by the Center for Labor Research at Ohio State University, the authors conducted four original surveys of elections in Ohio (1990–96), sampling union members and the general population. In addition to being a succint statement from a behavioralist perspective of the trajectory of American labor in politics since the 1950s, this work's distinctive contribution is the careful analysis of these surveys.

The study is set against the backdrop of a long process of erosion of the power of organized labor in the United States, as well as the political and organizational turn taken by the AFL-CIO in 1995 to arrest this decline. The authors have a strong sense of the transformation of the socioeconomic circumstances of organized labor. In the 1930s to 1950s period, the typical union member lived in an urban/industrial center, near the factory, in a neighborhood with many co-workers. In this environment, the union hall was an integral institution in the community, "the site of frequent meetings, wedding receptions, weekend dances, and summertime potlucks. Factory, family, union, and neighbors were intertwined" (p. 35). But the postwar period, of course, brought suburbanization and membership dispersal, as well as transformations of the American economy that resulted in membership decline, with a membership that was more white collar, self-identified as "middle class," and less committed to traditional strategies for achieving organizational goals.

While union density declined throughout the postwar period, the official labor movement adopted a status quo political orientation. Traditional union political strategy minimized expenditures on education and mobilization, particularly of members whose beliefs differed from the organization. Tar-

geting key races for political action committee (PAC) contributions, and then lobbying those elected to office, was easier than the painstaking process of working with the rank and file to solidify them behind the Democratic Party or a comprehensive issue agenda. Even though this system achieved few political victories for labor in the post-Taft Hartley era, it was able to protect organized labor from greater political defeats so long as the Democratic Party enjoyed majorities in Congress. As narrowly efficient as this strategy was, it bred organizational complacency. When Democratic control of Congress ended, labor was forced to reevaluate the traditional strategy. The Sweeney administration of the AFL-CIO has emphasized aggressive organizational campaigns, political mobilization of existing members, and an increasingly sophisticated use of electronic media to improve organized labor's image to the general public.

With the election of the John Sweeney as president of the AFL-CIO, organized labor sought renewal through a renewed focus on organization of new members, although it engaged in increasingly sophisticated electoral activity as part of a comprehensive strategy. Sweeney openly spoke of the danger that organized labor would be consigned to permanent irrelevance in the United States if unable to organize new members. The authors disagree with Sweeney's advocacy that organized labor renew itself by becoming a social movement representing universal interests, suggesting, definitionally, that social movements operate outside "normal institutional channels" and employ "illegitimate, disruptive tactics" (p. 3). Their judicious formulation treats organized labor as a "peak association" primarily concerned with advancing the interests of their own members, but capable of speaking for the interests of nonmembers as part of broader coalitions.

The book, however, is not centered upon organized labor as an interest organization advocating a policy orientation in the legislative arena. Instead, it is organized labor's work in elections, and the related activities of membership education and mobilization, that form the primary concerns of the volume. After examining the historical, demographic, and sociological transformations that have diminished union power in the postwar period, the authors explore members' attitudes toward unions (Chapter 3), traditional political strategy (Chapter 4), political strategy in the Sweeney era (Chapter 5), union political activists (Chapter 6), and election day outcomes (Chapter 7).

This research confirms the standard wisdom of behavioral studies that "party identification is the ultimate variable" (p. 41); in the case of organized labor, party identification and ideology are the strongest predictors of support for unionendorsed candidates. In other words, membership in a union alone washes out as a factor in vote choice, once controlled for party identification. Does this make labor irrelevant in American elections? Hardly. The authors convincingly argue that deeper, long-run education and mobilization do make organized labor a factor. Election campaign mobilization is less important than long-run education: "Committed members are more likely to look to the union for cues and to follow those cues" (p. 151). This seems to confirm the Sweeney administration's view that organizing new members, educating members and the general public on the positive social and economic benefits of unionization, and political strategy work hand in hand in the difficult task of revitalizing American unionism. It also points in the direction of studies on the formation of liberal ideology and Democratic Party identification, studies that in all likelihood will need to rely on different methodologies than those employed in this able expression of behavioralist research.

Superintending Democracy: The Courts and the Political Process Edited by Christopher P. Banks and John C. Green. Akron, OH: University of Akron Press, 2001. 396p. \$39.95.

The Votes That Counted: How the Court Decided the 2000 Presidential Election By Howard Gillman. Chicago: The University of Chicago Press, 2001. 301p. \$27.50.

Robert W. Langran, Villanova University

Superintending Democracy is a very fine collection of articles about the role of the judicial branch and our electoral system. It is an especially timely book in view of the Supreme Court's ruling in Bush v. Gore. However, the book does not focus on that one decision. Rather, the articles run the gamut and cover all the times the courts and electoral politics intertwine.

In the opening article, not only do editors Banks and Green discuss the theme of the book and how the remaining 11 articles fit that theme but they set forth a model to examine just how much of a role the courts do play. They look at the degree of intervention and whether the subject matter involves political resources or political actors. Then the next five articles use the political resources area.

The article by Banks has a myriad of cases that discuss the Supreme Court's response to political corruption, i.e., bribery, conflict of interest, campaign finance (with much emphasis on Buckley v. Valeo, the integrity of the ballot and franchise, political participation, and partisan parties. The author gives the Court praise. The John Bonifaz, Gregory Luke, and Brenda Wright article gives arguments why Buckley should be revisited in light of the massive campaign spending in federal elections, whereas the Joel Gora article likes Buckley's linkage of campaign spending with free speech. Each will be persuasive for its adherents. The Trevor Potter article looks at the Supreme Court's decision on disclosure in campaign finance reform, arguing that the Court will be more inclined to uphold disclosure laws for larger organizations than for individuals. The Barbara Perry article tackles the racial gerrymandering problem and how the Court has tried to steer a moderate path here.

The six articles concerning political actors starts with coeditor Green's look at the Supreme Court and political parties, beginning with a classic anecdote from one of his students about parties. Green fears that the Court may become too involved with intraparty disputes, a highly political matter. The David Ryden article looks at political reform and concludes that the Court has done poorly here with regard to minor and new parties, with the Timmons case a classic example. The David O'Brien article examines the Court's role in political patronage, stressing that it has not ended it despite allegations to the contrary. The Katy Harriger article focuses on the Whitewater and Iran-Contra controversies, arguing that independent counsels in both cases encountered problems in this investigation due to legal limitations. The Steven Tauber article shows how great the influence of the NAACP Legal Defense Fund was, is, and will be with regard to minority voting rights law. Finally, coeditor Banks closes with a look at Bush v. Gore, concluding that the Court did overstep its bounds here in its attempt to superintend democracy.

As for the Gillman book, it is a meticulous study of the 2000 presidential election and the role played by various people and institutions once Election Day was history. It differs from other books on the subject in that it gives an in-depth look at all the events that led to the Supreme Court's Bush v. Gore decision, so much so that the book is not only a fascinating read but also an excellent resource tool. After setting out the plan of the book, Gillman proceeds to show why Democratic voters in Palm Beach County had lawsuits filed in their behalf (his description of the "butterfly ballot" is illuminating)

and why Volusia County filed a lawsuit against the Florida secretary of state (later joined by Palm Beach County). Contrary to what many people believe, the Bush campaign filed the first lawsuit (for an emergency injunction to try to halt manual recounts), which was denied by a U.S. District Court judge and the Court of Appeals. The Florida Supreme Court would also not halt them, but after a lower Florida judge allowed the secretary of state to ignore late recount results, the Florida Supreme Court unanimously held that she must accept them and extended the deadline (although it later refused to compel Miami-Dade County to restart its recount, and it upheld a lower Florida judge's ruling that he had no authority to order a new election in Palm Beach County).

This is where the Bush campaign decided to appeal to the U.S. Supreme Court, and three days after hearing the argumants, it unanimously vacated the decision and asked the Florida court to clarify whether its decision was based exclusively on Florida statutes, which subsequently they said it was. The U.S. Court of Appeals then ruled 8-4 that the manual recounts were valid. As all this was occurring, separate cases were heard by lower Florida judges about the way absentee ballots were handled in two counties by Republicans, but were allowed, and the decisions were later upheld by the Florida Supreme Court. Meanwhile, the separate case of Gore v. Harris saw a 4-3 Florida Supreme Court order an immediate commencement of a statewide recount of so-called undervotes, the Court of Appeals deny Bush's appeal, but the U.S. Supreme Court 5-4 issue an emergency injunction to halt it. That same day, a U.S. District Court judge held that the Florida Constitution was not violated by the acceptance of absentee ballots after Election Day, said decision later upheld by a three-judge panel of the Court of Appeals.

That brings Gillman to a full discussion of the oral arguments before the U.S. Supreme Court in *Bush* v. *Gore*, followed the next night (December 12) by the Court's 5–4 decision holding that the manual recount violated the equal protection clause due to the standard for reviewing ballots, which allowed for too much variation. Thus ended the election, because Gore conceded the next day.

The book would be valuable enough if it ended here, as it has so much detailed information. However, Gillman now proceeds to give his analysis, and he comes to the conclusion that the Court's decision was wrong: It was a usurpation of judicial power, and even though it ended a period of uncertainty about next president, it was classic partisan decision making. Acceptance or rejection of that conclusion should not be the determining factor of the book's importance, which lies in its thorough examination of all the legal maneuverings surrounding this historic election. Both the Banks-Green and the Gillman books are worthy contributions to the literature on the role played by courts in electoral processes.

Continuity and Change in House Elections Edited by David W. Brady, John F. Cogan, and Morris P. Fiorina. Stanford: Stanford University Press, 2000. 297p. \$55.00 cloth, \$22.95 paper.

Patricia Conley, Northwestern University

For years, congressional elections were ignored or treated as fairly straightforward and predictable. The Democrats controlled the House. Incumbents nearly always won. Voters chose the candidate who would deliver the local goods. The magnitude of the Republican victory in the 1994 midterms set politicians, journalists, and scholars on a search to find an explanation that would place the election in the proper context. Was 1994 an outlier or the beginning of a new era? This volume places the 1990s in the context of the past 40 years of

House elections and provides a solid foundation for gauging whether 1994 was the culmination of long-term trends or a dramatic break with the past.

The book is an outgrowth of a conference sponsored by the Hoover Institute after the elections of 1994 and 1996, aimed at explaining how the Republicans could have captured the House of Representatives and retained their majority, despite Clinton's sizable reelection victory. First, what best explains the Republican takeover in 1994? A nationalized congressional campaign? Redistricting? A large number of Democratic retirements? Some chapters look at structural changes that provided opportunities for Republican gains over time; other chapters focus on more immediate causes of victory. Second, what are the factors that affected a member's reelection chances in the 1990s? Roll call voting or district service? The book suggests that candidate ideology and policy behavior played an important role in the congressional elections of the 1990s. In most chapters, the 1994 election is not viewed in isolation, but in the context of time-series data going back 20 to 40 years.

The early chapters outline long-term trends and structural changes that led to the Republican majority in the House. Gary Jacobson suggests that "the question is not so much why the Republicans finally won the House in 1994 but why it took them so long to do so" (p. 11). During the past 40 years, the incumbency advantage has declined and the number of contested House races has increased. In recent years, there has been a greater congruence between presidential and House voting. Jacobson argues that these factors, along with an increase in the quality of Republican challengers and voluntary retirements among Democrats, combined to give the Republicans their majority in 1994. Charles Bullock documents the increase in white voter support for Republican candidates in the South, where the Republican Party has gained the greatest number of seats. David Epstein and Sharyn O'Halloran analyze the effects of majority-minority redistricting.

Later chapters focus on the nationalization of the 1994 election. Congressional elections are typically viewed as lowsalience, local events. But in 1994, the Republican House leadership offered their "Contract with America" as a platform for all Republican candidates and ran against the politics of President Bill Clinton. The public was more aware of which party controlled the House in 1994 than in any election year since the mid-1970s when this type of data was first collected. John Hibbing and Eric Tiritilli show that in 1994, disapproval of Congress actually mattered-attribution of blame to the Democratic Party hurt Democratic incumbents. David Brady, Robert D'Onofrio, and Morris Fiorina discuss nationalization by examining how well House elections are predicted by the previous presidential vote. They provide an interesting account of the ups and downs of the local and national components of the House vote since 1954, and show that the national component of the vote was indeed on an upswing in

Several authors take issue with the notion that congressional elections are not oriented around policy. The steady increase in the ideological polarization of political parties in the House has made it easier for parties to be viewed as collectives and held responsible at the polls. Both Robort Erikson and Gerald Wright and also David Brady, Brandice Canes-Wrone, and John Cogan argue for the importance of policy by providing evidence that members who stray too far from their districts' ideological position are punished at the polls. Brady and his coauthors speculate that members may stray from their districts on roll call votes in exchange for appointments and perks offered by presidents and party leaders. David Leal and Frederick Hess examine the role of issues by interviewing the campaign staff of challengers in

several states in 1994. They find that Democratic challengers were less eager to campaign on the issues, even when their party was generally viewed as more competent on a particular issue. They argue that Republican emphasis on the issues, particularly crime, could help explain the magnitude of their victory in 1994.

The book provides persuasive evidence that the elections of the mid-1990s were not merely an anomaly. Congressional elections have changed. After reading this book, it would be hard to argue that congressional elections are purely local affairs. The public appears to treat members of Congress as men and women of style, pork, and substance. As for political predictions, the book suggests that the factors that led to the Republican takeover do not offer the Democrats hope of a dramatic return to power in the near future. In addition, Stephen Ansolabehere and Jim Snyder show that good committee assignments and membership in the majority party lead to much greater success in fund-raising, particularly political action committee donations. Thus, the Republican majority is potentially reinforced by incumbency advantages in raising money.

Although the major explanations for Republican victory are compelling, it is difficult to glean the relative weight of explanatory variables because each chapter focuses on a separate subset of explanations. One chapter documents changes in the South; another concentrates on the effects of congressional disapproval. Further, several authors impute policy motivations to voters when evaluating congressional candidates, yet only one chapter uses individual-level survey data to discuss the reasons and motivations of voters; other chapters use aggregate, district-level data. Senate races would be a helpful and interesting contrast. More attention could be paid to whether theories of divided government would be modified by what we have learned about recent congressional elections.

Yet despite these concerns, this edited volume is a major contribution to the literature on congressional elections. The chapters present solid empirical work and fit well together. In addition to providing a thoughtful analysis of the election of 1994, the editors have put together a volume that will give the reader an overview of the major trends, empirical measures, and theoretical questions that motivate this field of research.

The Politics of Breast Cancer By Maureen Hogan Casamayou. Washington DC: Georgetown University Press, 2001. 191p. \$60.00 cloth, \$19.95 paper.

Carol S. Weissert, Michigan State University

This book aims to explain why funding levels for breast cancer research suddenly achieved extensive media coverage, as well as both attention and action from Congress and the White House, in the period between 1990 and 1993. Maureen Hogan Casamayou's answer: the effective mobilization of legions of angry women and their allies by entrepreneurial leaders in a new breast cancer coalition. She tells the story of how these women came together, charted strategy, and succeeded in expanding federal funding.

In fact, the book covers more than this rather narrow time frame and provides an engaging and informative description of the history of funding for cancer research, the political activities surrounding that history, and the role of women legislators in bringing the issue of research parity to the policy agenda—all happening before 1990. In fact, as Casamayou notes, women's grassroots groups have been active against cancer for many years. For example, in 1937 a coalition of women's groups drummed up support for federal cancer legislation. Congressional hearings on breast cancer were first

held in 1976. Breast cancer has long garnered research funding, which in 1987 was larger than research related to any other type of cancer.

The actors (or actresses) in Casamayou's story are engaging and smart. Too many women die from the disease, but their contributions are many. Indeed, the contribution of this book is primarily in the story it tells of three breast cancer issues that played out prior to the announced time frame of the book: surgery options for breast cancer victims, mammography screenings, and funding for research on breast cancer.

Casamayou clearly and concisely documents the frustration of women in the 1970s when they sought alternatives to radical surgical treatment of breast cancer. When one medical writer sought to get a diagnostic biopsy prior to surgical removal of her breast, 19 surgeons turned her down. In the following years, a modified radical mastectomy and other surgical offerings became widespread. The efforts to increase access to mammography also took place in the 1970s. and mammography screenings greatly increased in the 1980s. Grassroots lobbying played an important part in the passage in the late 1980s of federal legislation requiring Medicare coverage of routine mammography screening. The original requirement was part of the 1988 Medicare Catastrophic Coverage Act that was later repealed. It was revived as part of the fiscal 1991 budget-reconciliation bill, even though it had been in neither the House nor the Senate bills.

In the late 1980s, women legislators in the Congressional Caucus on Women's Issues were raising questions about breast cancer research and other issues, such as the poor representation of women in clinical trials in National Institutes of Health-funded research. Senator Tom Harkin of Iowa, whose sister had died from the disease, was a strong supporter of increased funding for breast cancer research, and he was the initiator of the "ingenious device" by which Department of Defense money could be directly allocated for this purpose. As Casamayou notes, "It is indeed ironic that one of the most prestigious and traditional male-oriented government departments, the DOD, is disbursing funds for breast cancer research" (p. 161).

While this background is useful and provides extremely vivid examples of how legislative and individual entrepreneurs can affect policy in major ways, Casamayou's primary concern is the nationally and regionally organized efforts to affect policy in the early 1990s. She focuses on the National Breast Cancer Coalition (NBCC), which was formed in 1991 with the express purpose of political advocacy. The coalition built on the work of earlier advocates by organizing massive petition drives and marches, encouraging congressional hearings, and using the media to help tell the breast cancer "story." The NBCC was active in political campaigns; in the late 1990s it organized a voting registration drive and sponsored a national poll illustrating the importance of breast cancer to the American voter.

Casamayou describes the activities of the new NBCC, highlighting their mobilization and publicity efforts. While she asserts that the early 1990s are a distinctive and remarkable period in the history of grassroots mobilization, her own story highlights how this mobilization actually built on and expanded earlier efforts. The NBCC did provide an organizational framework for political advocacy—performed in earlier years by more loosely coupled groups and organizations focused primarily on funding issues. But the similarities far exceed the differences.

Casamayou makes the point that the success of the breast cancer-prevention advocates (pre-1990 and later) is because of their "collective entrepreneurship." But she does not cite the literature on collective entrepreneurship and indeed

never fully specifies how she is defining the term. Further, her "evidence" is pretty weak. She makes the (interesting) point that entrepreneurs in the area have had personal experience with breast cancer, but her documentation is flawed by a lack of clarification of how she is "counting." In one table, she counts the number of entrepreneurs in grassroots and national organizations but does not explain how entrepreneurs are defined and what it means that the Kentucky organization has two leaders (entrepreneurs) who had breast cancer. Similarly, the table does not explain why seven state organizations were selected. A second table supporting the idea that collective entrepreneurship took place has only a few of the states from the earlier table and little explanation for how the "shared experience" explaining their involvement was defined.

Another quibble is with the organization of the book, which early on mentions groups by initials and individuals by name. none of whom are identified. There is also some confusion caused by the author's skipping around in chronology—with some earlier events explained later in the book rather than in more obvious introductory sections. In addition, the espoused focus of the book on the 1990-93 period seems forced and inappropriate. Some of the most interesting events described in the book occurred before or after that period. She notes that the NBCC "fairly claimed much of the credit for the enormous increases in breast cancer research in the 1990s" (p. x), but the NBCC was not even formed until mid-1991. And the book does not provide a table showing the growth of funding for breast cancer—a mystifying omission given that explaining the growth in breast cancer funding is a major aim of this book.

Finally, the author doesn't adequately make the case that it is the national political advocacy group that is the true success story here. She undercuts her own case by showing how individual, congressional, and grassroots efforts started almost two decades before 1990, efforts which were very successful and paved the way for the NBCC—a latecomer to the policy world. Nevertheless, the book provides a very useful telling of a very interesting story of grassroots and congressional advocacy. It outlines the strategies, motivations, and personal stories behind this effort. The analysis of collective action on the part of the NBCC was a secondary and more disappointing aspect of the book.

Civil Rights and Public Accommodations: The Heart of Atlanta Motel and McClung Cases By Richard C. Cortner. Lawrence: University Press of Kansas, 2001. 240p. \$29.95.

Joseph Stewart, Jr., University of New Mexico

Mention Richard Cortner's name and political scientists think of "stories" of court cases well and thoroughly told. Cortner's latest effort is another superb contribution to this line of work. In this work he focuses on the two cases in which the constitutionality of Title II of the 1964 Civil Rights Act (CRA) was tested—the *Heart of Atlanta Motel* case and the "Ollie's Barbeque" case.

Title II was the most hotly debated part of the CRA, but, probably because of the relative ease of implementing its provisions compared to subsequent civil rights policy in voting rights, school desegregation, equal employment opportunity, or open housing, it has been neglected in recent scholarship. This inattention is doubly ironic given the fact that one of the most infamous of the Supreme Court's cases, *Plessy v. Ferguson* (1896), was a public accommodations case.

Cortner begins by setting background for and the context of the passage of the CRA. The constitutional and strategic issues are immediately obvious. Where does Congress get the power to legislate against racial discrimination in public accommodations? How can privately owned business enterprises be *public* accommodations? Does the Fourteenth Amendment's equal protection clause apply? Should Article I's Commerce Clause be dispositive? Would the Supreme Court be willing to overrule the *Civil Rights Cases* (1883), which struck down the previous Congressional attempt to outlaw racial discrimination in public accommodations—the Civil Rights Act of 1875?

Having set the stage, Cortner details the progress of each of the cases. The contrast is also immediately obvious. The Heart of Atlanta Motel is clearly and admittedly covered by Title II and houses a restaurant that had desegregated. Thus, the government (read: Solicitor General Archibald Cox) can take the offensive. (Recent attendees of the APSA convention might find it interesting to know that the motel stood on the current site of the Atlanta Hilton & Towers.)

Simultaneously, in the same city, Lester Maddox defended (literally, with pickax handles) his Pickrick restaurant against desegregation (and parlayed the accompanying fame into the Governorship and Lt. Governorship of Georgia, in that order). The FBI had thoroughly investigated this case, and the government was well prepared to defend this case at the Supreme Court. Because, however, Maddox declined to appeal his initial court loss, the first restaurant case came from an out-of-the-way barbeque joint in "Bombingham," Alabama—Ollie's Barbeque—which had not been the target of any enforcement action. Ollie McClung, Sr., according to Cortner, found the inspiration for his opposition to the CRA not in racism, but in religion. To the government's discomfort, the case was more tenuously connected to interstate commerce, the grounds upon which Congress had at least implicitly based the legislation. Interestingly, in both cases, both opponents of the CRA vowed to obey the Supreme Court's decision.

Cortner is at his best as he details the legal arguments in each of the cases and judicial deliberations of the cases combined. "Details" is not an idly chosen verb. Cortner's research into presidential files, oral histories, Department of Justice Civil Rights Division files (of the Heart of Atlanta case but not the McClung case, the files of which are lost), and files of participating attorneys is obvious. Cortner recalls both old (New York v. Miln, 1837) and more contemporaneous (Bell v. Maryland, 1964) public accommodations cases. His insights on the arguments and the rationales for those arguments of the Heart of Atlanta and McClung attorneys and the Justices is superb—the result of careful, time-consuming, and meticulous scholarly work. We know more about the politics of litigation and of Supreme Court politics because of this work.

So what? Cortner again does a superb job of explicating the importance of these cases for Commerce Clause and civil rights law. One might be tempted to say that these cases ended an era. After all, the Court has issued only one significant decision applying the public accomodations section since 1964 (Daniel v. Paul, 1969 [upholding the application of the public accommodations provisions to a privately owned recreation area outside of Little Rock, AR]). Cortner, however, demonstrates the continuing relevance of this litigation by comparing it to the "mini-revival of the doctrine of dual federalism" (p. 195) and the Court's willingness to impose limits on the use of the commerce power as a basis for legislation, signaled by the Court's rediscovery of the Tenth Amendment and its creative readings of the Eleventh Amendment. The account is current through the spring 2000 decision in U.S. v. Morrison (the Violence Against Women Act case).

Cortner's latest book is valuable on several dimensions. Even those scholars and teachers who have taught these cases for years will learn something from Cortner's account. Quite

simply, no one before has gone to the effort to amass so much information in one place about these important and interesting cases and the people involved. Scholars and teachers will already know the basics of judicial process and the nature of litigation that are presented herein, but their students, who do not, will learn what they need to know in the context of real cases, vividly depicted by Cortner. Thus, this volume would be a superb supplement in judicial process, constitutional law, civil rights, or American government courses. It should be read by anyone interested in these topics or teaching these courses.

Taking Aim: Target Populations and the Wars on AIDS and Drugs By Mark C. Donovan. Washington, DC: Georgetown University Press, 2001. 148p. \$50.00 cloth, \$19.95 paper.

Steven A. Peterson, Penn State, Harrisburg

One recent approach to the study of public policy has been policy design. And one component of this is the concept of target populations. Perhaps the strongest case for the importance of target populations as a focus for research has been advanced in the work of Anne Schneider and Helen Ingram. They have argued that target populations help to shape the construction of public policies. If target populations are politically weak and have negative constructions (for instance, drug users and drug dealers), then policies will tend to be harsh and punitive—penalties rather than benefits. In part, this serves political purposes, since one would get "political points" for being harsh with those who have little power and are perceived as "bad" people. In the process, bad policy may result, since the construction of target populations and policies aimed at them may have little to do with actually solving complex social problems.

Mark Donovan's book, Taking Aim: Target Populations and the Wars on AIDS and Drugs, begins where Schneider and Ingram leave off. His analysis of target populations adds an extra dimension—the nature of the problem being addressed. As a result, this book becomes a modest but useful step forward in the literature on target populations and policy design.

First, a brief description of the book. The first chapter simply explores the concept of target populations, building on the work of Schneider and Ingram. Donovan defines target population thus (p. 4): "Target populations are groups of people delimited by some shared characteristics who are identified through legislative language as the recipient of a benefit, a burden, or special treatment under federal law."

Donovan notes the importance of the political ambition of elected officials in dealing with target populations. He also emphasizes the key role of social problems. In the end, policy is a function of the interaction of target populations and social problems, with political ambition of elected officials and the structure of political institutions also coming into play.

Chapter 2 elaborates upon the political context, noting the importance of institutions, especially committees and committee hearings and floor debate, on the politics of target populations. Hearings and other venues provide opportunities for political leaders to "explain themselves" regarding policy choice—including how target populations are to be treated and why.

Chapters 3 and 4 are case studies of target populations: first, drug policy, and second, AIDS policy. Many in the target populations of drug users and AIDS victims are negatively constructed—and without much power. Thus, not surprisingly, political discourse can be harsh against such groups, with penalties assessed against them. Examples include the

clever use of politicizing the target population of AIDS victims by Jesse Helms and how he put opponents into a bad political position by his framing of the targeted people with AIDS (PWAs). However, Donovan notes that within each target population we find subpopulations, such as veterans who become drug users. Political leaders make fine-grained calculations and may treat different subgroups within a target population differently for political purposes (e.g., veterans who are drug users end up treated differently than other subpopulations of drug users).

The end result, as the rest of the book shows, is that sometimes segments of negatively constructed target populations are treated positively by Congress, receiving benefits rather than punishment. The Ryan White Act, for instance, provides benefits for some components of the AIDS population, based on the positive construction of innocent victims, such as hemophiliacs. This discussion is a modest advance over the original conceptualization of target populations by Schneider and Ingram.

A key case study is needle exchange. This is a program that has some rational linkage with reducing the spread of AIDS among intravenous drug users. But the "war on drugs" makes it, politically, extremely difficult for policymakers to accept this program as a policy choice. The construction of target populations is one important element in this political decision.

All in all, this is a useful volume that advances discourse on target populations. A number of commentators have observed that the policy design literature often has an abstract, ungrounded flavor to it. One aspect of policy design, though, does appear to provide an opportunity for solid empirical research, and that is the focus on target populations. What Schneider and Ingram did at a conceptual level, Donovan does at a more grounded level: He demonstrates the importance of the concept for explaining federal policy. Especially noteworthy is his use of content analysis to examine committee hearings and floor debate in order to see what themes emerged and how these were linked to target populations and policy problems, as members of Congress grappled with how to create policy on drug use and AIDS.

This book will be useful to readers who are interested in the formation of public policy, who are interested in the nature of policy design—especially as policy design is linked to target populations, and who study the nature of the linkage of social problems with policy solutions. In the final analysis, this book makes a nice, albeit limited, contribution to the literature.

## Married to the Mouse: Walt Disney World and Orlando By Richard E. Foglesong. New Haven, CT: Yale University Press, 2001. 251p. \$27.95.

Susan E. Clarke, University of Colorado at Boulder

This account of the development of Walt Disney World in Florida is an engaging contribution to the growing literature on tourism and urban politics. The many pleasures of reading this book include learning that Disney World was initially slated for St. Louis, that Henry Kissinger declared that Epcot would enhance world peace more than this shuttle diplomacy, that Disney prepared a proposal for a HUD planning grant for Disney World, and that even Walt Disney thought that Disneyland Anaheim was tacky. Foglesong meticulously details more than three decades of negotiations among the Walt Disney corporate conglomerate, the city of Orlando, and Orange and Osceola counties in Florida over the location and development of Walt Disney World and its spinoff theme parks. Not surprisingly, the Mouse wins most of the battles.

To Disney, "both capitalism and democracy were problematic," in Foglesong's felicitous diagnosis. Each resulted in more fragmentation than the Disney corporation considered tolerable; to resolve this dilemma in Florida, the Disney corporation constructed a land development model with highly centralized administration and control, embedded in fused private and public powers. Disney negotiated not only for tax breaks and infrastructure development subsidies in Florida but also for institutional arrangements that granted Disney developments autonomy from local and state political control. These institutional privileges and "immunities," rather than tax incentives per se, are at the heart of the Orlando deal. It promised growth in exchange for privatization of governmental authority and deregulation of conventional land use and zoning controls. The Orlando area boomed with the location of Disney World: It remains one of the fastest-growing urban areas in the United States, job growth is explosive, and an enormous tourism infrastructure of hotels, entertainment attractions, and commercial development continues to unfold. The price of this growth, however, is equally staggering: Tourism brought low-wage jobs, overloaded local services and transportation facilities, and created substantial affordable housing shortages.

For Orlando and the surrounding counties, the Disney deal proved remarkably lopsided. Tax breaks reduced the local tax revenues that might have contributed to meeting the costs of explosive growth. The establishment of Reedy Creek Improvement District as a special-purpose district governed by Disney allowed the Mouse to control development as well as crowd out other local governments in bidding for bond financing for the Disney World infrastructure. Disney's informal influence operated through lavish perks for local and state officials, well-funded lobbying, a clientelistic pattern of contracts with planning organizations, engineering and construction companies, and legal firms throughout the region, and a readiness to enter into lawsuits with anyone appearing to stand in the way of the corporate mission. And in an early and prescient move, Walt Disney himself insisted that the Disney World project spill over government boundaries to ensure interjurisdictional competition for Disney favors.

Early on, the Orange County Commission (p. 73), labor unions (p. 86), and public planners (p. 91) contested the Disney initiatives. Indeed, when opponents mobilized to voice their concerns, Disney often made strategic concessions to preserve its favorable image and public support. These occasions were infrequent, however, the concessions were modest and public officials rarely pursued their advantage in negotiations over an obviously immobile investment. Most local elected officials sought growth, local political structures were underdeveloped, the media remained syncophantic, and local taxpayer and downtown business organizations found it difficult to mobilize challenges to Disney's legal and fiscal powers.

But as Foglesong astutely notes, "legal powers exist in a political context" (p. 114); changes in the political context eventually undermined the seemingly hegemonic Disney control. In 1985, the state began to implement growth management legislation requiring "concurrency" in private development and public facility provision; this meant that Disney would have to negotiate with local communities if it continued its aggressive development plans. Disney's corporate decision to move beyond hotel and entertainment development and to launch Celebration, a planned residential community development, outside its own Reedy Creek special district, triggered a growing chorus of discontent from Celebration residents and taxpayers in surrounding communities. And over the years, the Disney presence itself set in play changes in local economic and political conditions that encouraged

resistance from citizen groups and the occasional civil servant, such as Osceola's Property Appraiser, willing to stand up to the Mouse. Even though political factors and conflict became more important over time, there is little evidence of an alternative vision or strategy for the area. Foglesong sets out some options in his conclusion—building on the emerging high-tech sector rather than offering further incentives for tourism, constructing a human capital agenda, establishing a living wage policy, and supporting revitalization of downtown Orlando—but there is little reason to anticipate that the necessary leadership or constituencies for these agendas will emerge. This inability to anticipate the conditions under which these agendas might become important hints at some of the weaknesses of the study.

Foglesong's narrative underscores the importance of documenting the postwar urban development experience while many of the key players are still available. This is ultimately a descriptive rather than an analytical or theoretical account of these processes. While this is a significant accomplishment, the many claims to loftier theoretical goals mar the effort, not because they are inappropriate but because they are not used to frame and interpret the analysis. The study is sprinkled with references to regimes, regime transition, growth machines, path dependency, and human capital agendas; but this is primarily a story about a clever and complex land development deal in Florida rather than an analysis using these concepts to understand better the political processes involved. Few readers will see this as a case study assessing "the significance of Walt Disney World for city-building and urban governance" (p. xi), much less be persuaded of Disney's intellectual interest in urban planning ideas. Nor are private decision making, privatization, and deregulation unique to Orlando and as remarkable as Foglesong's emphasis suggests, although the scale at which these occurred is noteworthy. Similarly, Foglesong declares that a regime perspective, with its emphasis on political factors, provides "a better understanding of the dynamics of the Disney–local relationship" (p. 189) but falls short of linking the details to the theory.

Instead, Foglesong uses the metaphor of love and marriage to frame his work. Each chapter is titled accordingly, ranging from "Seduction" to "Conflict" to "Therapy." This comes across as precious rather than insightful; using this framework stymies any attempt at theory-building. This is most apparent in the final chapter ("Therapy"), one of the strongest in the book. Foglesong's observations about the Disney World experience are intriguing but disconnected; references to regimes and other concepts appear as afterthoughts in a book structured around a rhetorical device rather than a theoretical argument. In the absence of an analytic logic, alternative explanations, or counterfactuals, the reader is left to sort out the meanings and implications of being Married to the Mouse.

## Tabloid Justice: Criminal Justice in an Age of Media Frenzy By Richard L. Fox and Robert W. Van Sickel. Boulder, CO: Lynne Rienner, 2001. 225p. \$55.00 cloth, \$22.00 paper.

William C. Green, Morehead State University

We live in a tabloid era defined by *The National Enquirer* and *The Star*. How has it affected popular confidence in the criminal justice system? Richard L. Fox and Robert W. Van Sickel's study examines the mass media's tabloid news coverage of high-profile criminal cases that involve violence and race, gender, and social class issues. This news coverage, they argue, sacrifices the media's educational function, misinforms the public about the operation of the criminal justice system, and contributes to the public's lack of faith in criminal justice.

The authors argue that the 1990s are a unique period in tabloid news coverage of criminal trials and investigations. Chapter 1 introduces seven cases—William Kennedy Smith, Rodney King, Erick and Lyle Menendez, O. J. Simpson, Louise Woodward, JonBenet Ramsey, and William Jefferson Clinton—that serve as vehicles to explore the mass media's use of criminal cases as entertainment. Chapter 2 details how the mass media became tabloidized with the blurring of the mainstream media and tabloid press and the emergence of television news magazines. Then it explores how the tabloidized media increased the amount and immediacy of its coverage of criminal cases. Chapter 3 examines the rise of the new media of cable television news, talk programs, and the Internet, which, the authors argue, has increased the tabloid coverage of political and legal news. Chapter 4 presents the findings of the authors' 1999 national poll conducted to assess the criminal justice effects of tabloid media coverage. Their poll results reveal a high level of familiarity with the seven tabloid cases and low levels of confidence in the criminal justice system and in police, judges, and juries. Chapter 5 turns to the national poll's examination of the racial, gender, and class impacts of tabloid media coverage and finds that the seven cases diminished confidence in the criminal justice system's treatment of blacks and women and of all defendants regardless of their economic status. The findings also reveal that blacks and women viewed these cases as lessening their confidence in the criminal justice system, but there were no differences on the basis of wealth.

In sum, the authors find that commercial interests now drive the mass media's focus on criminal trials; that the mainstream media are increasingly employing tabloid techniques in reporting criminal cases; that cable television, talk radio, and the Internet are critical elements in fostering a tabloid justice environment; that faith in the criminal justice system has decreased as public awareness of high-profile criminal cases increases; and that tabloid coverage reinforces racial, gender, and economic cleavages (pp. 187–90).

Tabloid Justice suffers from two faults. First, there is only a tenuous connection between the social constructionism theory the authors discuss at the outset (pp. 5-7) and their analysis of the data on tabloid news coverage. Largely absent is any sustained attention to larger historical, political, economic, and cultural changes driving the transformation of television news. Over the past 30 years, they claim that there are three "distinct" periods (1968-74, 1975-89, and 1990-) in which television news coverage has changed, but they fail to define their "social and political importance" criteria for these periods and they fail to include all the cases from Table 2.5 (p. 69) in their analysis of the 1975-89 period. If they had included Patty Hearst, John Hinckley, Bernard Goetz, and Jim Bakker, all identified in Table 2.5, they would not have been able to conclude that the media focused on "more individual and personal types of crimes" and less on crimes of broad social and political importance (p. 68). When they turn to the 1990s, they assert that it is a distinctive decade in which media coverage increased largely due to an increasingly frenzied climate of tabloid journalism fostered by their seven tabloid cases, but they do not provide any criteria for the choice of their seven cases (p. 30), nor do they explain findings contrary to their argument. In their discussion of Table 2.10, they tell us that 60 Minutes and 20/20's coverage of tabloid cases did not increase, but they do not explain what the table tells us: The coverage by these two television newsmagazine programs decreased by 2%.

Second, the authors create a straw man, the media as civic educator, and then bewail the fact that news coverage does not live up to their expectations. The news to which they want the media to give continuing coverage is information about

events that do not often touch our personal lives directly: diplomatic visits, tree-spiking environmentalists, and campaign finance reform. Yet the authors cannot demonstrate that their straw man's tabloid coverage of criminal trials and investigations has lessened popular faith in the criminal justice system or its police, judges, or juries. In fact, they admit that they cannot confirm their second and most critical of three hypotheses: "Public exposure to tabloid cases has diminished confidence in the criminal justice system" (p. 127). All they can establish is a "relationship between an individual's general confidence in the system and how the system worked in each of the cases" (pp. 134-35), and not the direction of this relationship. Even this conclusion is thrown into doubt by the failure of the first question of their national poll to focus solely on the media: "When you learn of the verdict in a criminal case, whether it is in the news or through talking with friends and family, how confident are you that the criminal justice system made a correct decision?" (p. 202). These observations also apply to their analysis of race, gender, and economic status. The authors are unable to tie levels of confidence based on these demographic groups to a tabloid style news coverage of criminal cases. In sum, Tabloid Justice may have established a case based on reasonable suspicion. but not on probable cause.

By Popular Demand: Revitalizing Representative Democracy Through Deliberative Elections By John Gastil. Berkeley: University of California Press, 2000. 275p. \$48.00 cloth, \$18.95 paper.

Christopher Wlezien, University of Oxford

A growing chorus of academics, journalists, and politicos alike bemoans the state of American democracy. The symptoms are well known. Public trust in government has declined over time, the stock of social capital has shrunk, and turnout remains low. Some observers even argue that politicians now are less responsive to public opinion on various issues. Perhaps understandably, there is increasing pressure for reform of the electoral process, including campaign finance, the conduct of campaigns, media coverage of campaigns, and election rules themselves. In *By Popular Demand*, John Gastil joins the call for reform, but in an original and provocative way.

The book begins on familiar territory: the tenuous state of representative democracy in the United States. Gastil states: "There are two fundamental problems in American politics. The first is that most Americans do not believe that elected officials represent their interests. The second is that they are correct" (p. 1). That is, there is a democratic deficit in the United States and a serious one at that. The problem to Gastil is that elections fail to ensure the accountability of elected officials. This failure of elections ultimately reflects "underdeveloped public judgments, superficial voter evaluations of candidates, and the shallow pool of contestants for elected office" (p. 33).

Gastil marshals a lot of the empirical literature that implies or might imply that public opinion is largely uninformed and incoherent and that most voters are largely incapable of making decisions based on policy preferences. He highlights incumbent reelection rates to argue that sitting politicians have effectively stifled competition among candidates, which leaves voters with little choice on Election Day. The confluence of these factors, according to Gastil, has produced the misrepresentation, nonvoting, and distrust that we currently observe in the United States. Civic neglect has taken root.

Gastil considers various radical and conventional reforms of the process that have been proposed over the years and finds them wanting. They will not meaningfully change a thing, he argues, because the real problem is with the public's voice itself. It simply is not clear to politicians what the public actually wants, partly because most of us have little information and partly because we speak in a cacophony of voices. Measured public opinion thus is of little guidance to elected officials. As Gastil writes: "Officeholders cannot represent the public's policy judgments to the decision-making body until the public presents those concerns to them" (p. 111). He argues further that revealing this public voice requires active deliberation among citizens: They must be brought together to discuss issues face-to-face.

Deliberative forums have been used in the United States for some time now and Gastil nicely traces the history, from early efforts to promote civic education to more recent attempts to conduct deliberative polls. He finds much to recommend these forums but concludes that a full-fledged deliberative democracy is not feasible. This is understandable. It nevertheless is possible, he argues, to use deliberative methods to reveal a meaningful public voice on various political issues. Specifically, he proposes using "citizen panels." Here a representative sample of the public would be brought together to deliberate on the issues of the day, aided by the testimony of various partisan and expert witnesses. This would serve to reveal a public voice on political issues. Then, to actually reflect these preferences more broadly, and in a politically meaningful way, summary information about the conclusions of the panels would be made available to the voting public, say, in the League of Women Voters' guides. Gastil goes even further in some formulations and recommends putting the information on ballots themselves. By doing so, voters would have ready access to the considered opinions of typical people on the important issues of the day. They would be armed and dangerous, at least for incumbent politicians. This could serve to fundamentally revitalize representative democracy in the United States, according to Gastil.

What Gastil is proposing clearly is provocative and warrants consideration. Let me put aside practical issues, such as picking issues for citizen panels to consider, putting together and running the panels, and summarizing the results of the deliberations, let alone getting this information on ballots. These are for others to sort out. My concerns are more basic: the existence of a real problem in modern American democracy, whether more information about issues and candidates is the solution, and what deliberative elections might actually accomplish.

In contrast with Gastil's characterization, a good amount of research shows that representative democracy in the United States actually works quite well. We have learned that the American public has meaningful preferences for policy, at least in certain areas, and acquires reasonably accurate information about candidates' positions (and policy itself) in these areas. We also have learned that voters use this information when evaluating politicians and, perhaps most importantly, that elected officials represent public preferences in policy. Some research even suggests that politicians quite literally respond to changing preferences over time. Gastil does not reflect this literature, at least not much of it. As a result, his portrait of American political life is not quite right. It is not that things are perfect. It's just that the sky is not falling.

This is not to gainsay the value of providing additional information to voters. After all, with more, presumably representative, information, there is reason to suppose that people's opinions will change. Of course, this is most likely where people have little information to begin with. With more information, opinions about extending "most favored nation" status to China, for example, are likely to change. So are opinions about approaches to regulating water pollution. This is not surprising. Neither is it surprising that most people know

little about these issues to begin with. They are not salient to many voters. But why then would they vote on the basis of these issues? What difference would the added value of deliberation actually make on Election Day? This is of fundamental importance, as Gastil himself claims—the electoral incentive being the most reliable motivation for politicians. He does consider the electoral connection in a very general way toward the end of the book, and is surprisingly tentative in his expectations. One ultimately cannot help wondering what deliberative elections can accomplish, even in the best of circumstances.

Perhaps there is reason to experiment, which Gastil encourages us to do in his concluding chapter. Perhaps we will learn that deliberative elections can have a beneficial effect on the quality of voters' judgments, the responsiveness of politicians, and public trust in government itself. I am not optimistic, however. All Gastil really offers us here is hope. The book is interesting, to be sure. It also is well written. It just does not add anything to what we already know. Then again, that is not what Gastil sets out to do, and he has given us something to think about.

Justice & Nature: Kantian Philosophy, Environmental Policy, and the Law By John Martin Gillroy. Washington, DC: Georgetown University Press, 2000. 443p. \$70.00 cloth, \$34.95 paper.

Kerry H. Whiteside, Franklin & Marshall College

That environmental problems such as groundwater contamination, global warming, and loss of biodiversity pose mounting political challenges is now widely admitted. The meager progress in reversing these trends calls into question the adequacy of policy instruments conventionally used to address them. Gillroy maintains that the environmental policy failure stems from its grounding in economic reasoning. An alternative paradigm of Kantian inspiration is his proposed remedy.

The market paradigm that informs cost-benefit analysis and current environmental legislation makes efficiency the primary measure of sound policy. Through a "thin theory of autonomy," that paradigm valorizes a society in which individuals exercise freedom in the form of choices that aim to give them opportunities to achieve, in relation to their initial endowment of goods, the highest index of satisfied preferences. In contrast, Gillroy proposes a thick theory of autonomy that discriminates morally among preferences. It recognizes that endowments are unequal and that individuals have a moral claim on the material and cultural resources that are necessary for them to become capable of truly free choice. It takes account of the human ability to revise preferences in light of a fuller understanding of personal potential and community well-being. And it understands that the functional integration of living and nonliving components into evolving natural systems generates noninstrumental value worthy of human respect. Securing at least a minimal "baseline" of conditions that support the autonomy of both humans and nature should become the standard of a just polity (p. 280).

In building this alternative paradigm, Gillroy contributes to scholarly debates in an unusually wide range of disciplines. Philosophers will discover a nuanced reconstruction of Kant's moral and political philosophy. Gillroy credits Kant with greater moral flexibility and more attention to communitarian concerns than is commonly acknowledged. Policy analysts should be drawn to Gillroy's contention that the strategic situation driving many cases of environmental risk-taking is not a prisoner's dilemma, but an assurance game: a situation in which citizens would prefer to cooperate to protect collective goods, provided that the state acts to prevent others

from taking advantage of them. Environmental ethicists will be struck by Gillroy's view that Kant would recognize a duty "to respect and preserve nature's functional integrity as an evolutionary and homeostatic end-in-itself" (p. 189).

That is a highly controversial claim. In The New Ecological Order (1995), Luc Ferry maintains that Kant's emphasis on freedom as the source of a being's inherent worth excludes intrinsic value from nature's causally determined order. Yet, demonstrates Gillroy, Kant did call for harmonizing humanity and nature, and he saw something inherently wrong in "destroying all order in nature" (pp. 184-189). Critics may still challenge the idea that functional integrity constitutes intrinsic value. Surely functionally integrating the parts of my computer does not give those parts inherent worth. For Kant, our moral duties toward other people are grounded not in our functional interdependence with them, but in each person's existence as a rational self, who can guide his or her own behavior in a principled way. Simply instrumentalizing people is wrong because it overrides the very capacity that commands respect. Ecosystems, even if they are "self-regulating" in a sense, do not regulate their actions by principle. So it remains unclear why instrumentalizing them is intrinsically any more wrong than dismantling my computer for spare parts. Perhaps the wrongness stems from the disruption of life or perhaps there is something about the nonhuman origin of certain homeostatic processes that makes them especially valuable. But Gillroy develops neither argument. It remains open to question whether the Kantian language of inherent worth is adequate to the task of describing an ethic of respect for things that we must continue, at some rate, to chop down, to domesticate, to eat.

This book illustrates the promise and the pitfalls of *a priori* moral theorizing in environmental affairs. Promisingly, it does a fine job of grounding the intuition that the significance of some goods, including natural ones, is distorted unless we devise political processes protecting them from commensuration, aggregration, and trade-offs. From a strictly pragmatic perspective, polluting an aquifer and providing bottled water to local inhabitants can seem morally equivalent to preventing groundwater contamination in the first place. Those who reject such equivalency will be attracted to Gillroy's "Ecosystem Design Approach."

A pitfall of a priori theorizing, however, is a tendency to envision policy as the direct implementation of moral imperatives, without pausing to ask whether the prescribed approaches are ratified by political experience. Gillroy tends to favor regulatory regimes that rely on centralized, state-sponsored, scientifically informed decision-making processes (e.g., pp. 311, 342, 378). Meanwhile, he is content to leave unspecified the level of aggregation-individual life form, species, ecosystem, biosphere—at which safeguarding "nature's" intrinsic value becomes imperative. As a result, the potential scope of bureaucratic discretion in Gillroy's world of anticipatory regulation is breathtaking. He would require that "all risk-producing activity causing collective damage to environmental security be justified as supporting moralbaseline needs before it can continue" (p. 145). Since virtually all human activity disrupts some manifestation of "nature, just about any imaginable economic enterprise might be subject to ex ante regulation. Students of bureaucratic behavior might wish that Gillroy had considered evidence that dysfunctions such as regulatory capture, corruption, and stultifying inertia can compromise the effectiveness of such centralizing approaches.

But more analysis is not really what would most increase the appeal of this book. It already contains so much material that its Table of Contents is longer than the present review. If its audience were more precisely targeted, this volume could be more approachable. Gillroy hopes for readers as comfortable contemplating Kant's Realm of Ends as perusing Supreme Court opinions on environmental impact statements or digesting academic debates over the concept of Kaldor efficiency. Those with more specific interests will find their patience tested at times. Quite justifiably, most will read this book selectively. Parts of *Justice and Nature* will then rightly find their way into many graduate-level seminars on environmental policy and environmental ethics.

The Limits of Policy Change: Incrementalism, Worldview, and the Rule of Law By Michael T. Hayes. Washington, DC: Georgetown University Press, 2001. 204p. \$60.00 cloth, \$21.95 paper.

Robert F. Durant, University of Baltimore

"There remains," writes Michael T. Hayes in his provocative new book, "a pressing need to educate the publicspecialists and nonspecialists alike—on what politics can accomplish, and at what speed" (p. 189). To this end, Hayes challenges what Thomas Sowell (A Conflict of Visions, 1987) calls the tenets of "articulated rationality" (i.e., rationalcomprehensive ideals) in the policy process. He vigorously asserts that the benefits of incrementalism (viz., its focus on "partisan mutual adjustment," its understanding of "the importance of checks on the arbitrary abuse of power," and "its ability to draw on the dispersion of knowledge throughout the political system" [p. 8]) exceed its costs (e.g., delay and incoherent policy outcomes). Moreover, on balance, "partisan mutual adjustment produces better [emphasis added] policy outcomes than any attempt at rational-comprehensive analysis" (p. 8).

Grounded in the "anti-rationalist" tradition (e.g., Hayek, Law, Legislation, and Liberty, 1948), Hayes begins by reviewing the reasons why rationalists (i.e., those predisposed toward "large-scale policy experiments," "logical coherence" of thought, and "perfect solutions to problems" [p. 29]) presumably err. Among other things, they underestimate human fallibility, hold naive faith in reason alone to address public problems (as opposed to the "systemic rationality" afforded by tradition, custom, and political bargaining and compromise), and overestimate what government can accomplish. These errors, in turn, produce failed results, disillusion citizens, and accrete presidential and bureaucratic power at the expense of Congress.

Hayes, however, is no apologist for incrementalism. In lamenting the biased pluralism it produces, he argues, first, for federal policies (e.g., tax subsidies and campaign finance reform) to "mobil[ize] interests that currently are unorganized and thus unrepresented in the policy process" (p. 162). Thus, rather than wanting to *lessen* conflict among interest groups (a common reform prescription), Hayes wants to *heighten* it by expanding the types of contestants participating. Second, to combat interest group pluralism and constrain bureaucratic discretion, Hayes joins Lowi (*The End of Liberalism*, 1979) in promoting policymaking premised on the "rule of law" (i.e., making laws that apply equally to everyone and do not discriminate against or privilege particular groups).

After stressing how evaluations of incrementalism are colored by personal views of human nature and what is achievable through politics, Hayes is at his analytical best in Chapters 3 through 9. Using case analyses of the Clean Air Act (CAA) of 1970, the Personal Responsibility and Work Opportunity Act (PRWOA) of 1996, and the Clinton health care initiative in 1993–94, he offers a series of typologies for sorting out the dynamics of the policy process. Included are typologies of philosophical worldviews (Chapter 3), policy

processes (Chapter 4), public policies (Chapter 5), policy environments (Chapter 7), and policy outcomes (Chapter 9).

Especially useful is how Hayes puts contemporary policy controversies into the context of enduring philosophical debates (among adaptive conservatives, utopian visionaries, nostalgic conservatives, and meliorative liberals). Valuable also is his identification of key contextual factors (and their interaction) that animate those debates. He identifies, for example, how different policy demand patterns (conflictual versus consensual) lead to different reactions by Congress (e.g., nondecisions, delegative policies, and allocative policies). Highlighted throughout is how interest group inequalities contribute to these disparate congressional reactions.

Likewise, Hayes offers insights (some counterintuitive) that beg testing, elaborating, and refining in future research. For example, in classifying policies by how consensual or conflictual their objectives are and how well- or ill-understood their proposed solutions might be, his analysis both refines and challenges conventional thinking about mass public arousal (e.g., Charles O. Jones, *Cleaning the Air*, 1975). Absent a convergence of consensual objectives and expectations, for example, Hayes argues that mass public arousal leads to dramaturgical incrementalism (i.e., symbolic policies—e.g., nuclear freeze legislation in the 1980s—that may or may not address the problem), rather than nonincremental policy change.

Despite these strengths, however, Hayes ultimately fails to make a persuasive case either that the benefits of incrementalism exceed its costs or that it produces better policy outcomes than rationalist strategies. They certainly may, but he offers neither an explicit empirical standard for testing these theses (i.e., "better" in what sense and measured in what way?) nor systematic comparisons of these disparate types of policy approaches in practice (e.g., comparing environmental policies produced at different times or places using rationalist versus antirationalist processes). Rationalists, moreover, will dismiss his litany of their "shortcomings" as a caricature rather than a serious treatment of their aims, assumptions, or approach to policymaking. Skeptics, too, will note that large-scale and initially nonincremental programs like Social Security, Medicare, and the Marshall Plan did work; did not produce citizen disillusionment; were devised with political acumen rather than "naïveté"; and were not premised on assumptions of human infallibility.

Nor is Hayes's case for the superiority of incrementalism helped by leaving key concepts undefined (e.g., what constitutes adequate "deliberation," "incremental versus non-incremental change," and "public arousal" versus "public anxiety"). This conceptual ambiguity places judgments about "better policy" squarely within the eye of the beholder. For example, his own "rule of law" proposal will strike some as utopian, naive, and misguided. Nor is his argument helped by conceptualizing rational-comprehensive and incremental decision strategies as mutually exclusive in practice. The former can be a potent "input" into the latter, qualitatively altering policy discourse, options, and outcomes.

Readers more sympathetic to nonincremental policy needs, processes, and possibilities also are unlikely to believe that Hayes has adequately presented or effectively countered their arguments (and counterarguments to incrementalism) as robustly as he could. For example, he curtly dismisses in a paragraph (p. 96) the theses that periodic bursts of nonincremental policy change do occur (e.g., Frank Baumgartner and Bryan Jones, Agendas and Instability, 1993). Even more broadly, one wishes that Hayes had explicitly related his arguments to contemporary reconceptualizations of interest group, policy process, and bureaucratic dynamics and motives.

Recent scholarship, for example, challenges "capture" theories of agencies and images of unresponsive bureaucrats (B. Dan Wood and Richard Waterman, Bureaucratic Dynamics, 1985), notes the rising success of postmaterialist over materialist values in the policy process (Jeffrey Berry, The New Liberalism, 2000), and heralds the power of ideas (Paul Sabatier and Hank Jenkins-Smith, Policy Change and Learning, 1993). Yet Hayes's arguments rest largely on tenets of interest group liberalism that these reconceptualizations modify or challenge.

These shortcomings and oversights, however, do not lessen the importance of addressing the problems of incrementalism that Hayes summarizes. Nor do they make his contributions less important for policy specialists and nonspecialists to engage seriously. If they do, the educational aims of *The Limits of Change* will be realized.

Who Speaks for the Poor?: National Interest Groups and Social Policy By R. Allen Hays. 277p. New York: Routledge, 2001. \$75.00.

Declarations of Dependency: The Civic Republican Tradition in U.S. Poverty Policy By Alan F. Zundel. 178p. Albany: State University of New York Press, 2000. \$50.50 cloth, \$17.95 paper.

Douglas R. Imig, University of Memphis

The new monographs by R. Allen Hays and Allen F. Zundel are welcome additions to our effort to understand the processes by which Americans make social welfare policy. Hays's work looks at the set of interest groups that testified before Congress on poverty policy during the 28-year period from 1970 to 1997, a period characterized by both incremental change and major upheaval in poverty policymaking. Zundel's work examines the rhetorical frames that have driven major social welfare reform efforts over the past century and a half.

In Who Speaks for the Poor? Hays provides a close examination of those who gave testimony before Congress during the 1970s, 1980s, and 1990s on three critical sets of issues: housing, food stamps, and cash assistance. Hays answers his title question by showing that a "chorus of voices" participate in drafting major legislation affecting the poor (p. 4). But of the dozens of groups that testified before Congress, almost none are made up of low-income people. Instead, the interests of the poor are represented by proxies, including intergovernmental lobbies, public and private sector service providers, and public interest and good government groups. After reviewing who testified on these dimensions of social welfare policy, the final sections of the work are devoted to a call for more direct participation by the poor in politics and for more community organizing around social justice.

Hay's project provides much-needed insights into the configuration of organizations that testified on key pieces of legislation during a critical era in the history of American social welfare policy. Over these 28 years, we saw both expansions in social welfare spending (e.g., through Nixon's block grant programs) and profound retrenchments (most notably, the abolition of entitlements to assistance through the 1996 Personal Responsibility Act). Hays's analysis sheds light on the ways that major shifts in the direction of policymaking influence the actions of individual groups (p. 16), as well as the influence of policy shifts on the composition of policy communities (p. 35). The work is largely silent when it comes to identifying which voices were most significant in engineering the fundamental shift itself in the overall direction of American social welfare policy during this period, or the mechanisms through which that shift occurred.

Ultimately, Hays attributes major policy shifts to "forces outside the arena of interest group struggle" (p. 139), and proposes a number of potentially critical factors. These include the weakening of labor unions and a shift to post-Fordist modes of production (p. 59), the growth of well-funded conservative think tanks in the 1970s and 1980s (p. 61), and shifts in party control of Congress and the White House (e.g., p. 80). It would be helpful if the work offered a theoretical construct for understanding the ways in which these factors influence the policy space available to alternative visions of effective social welfare policy. We are left to wonder if these contextual factors work in consistent ways across time in shaping the debates surrounding policymaking.

Additionally, the work is largely silent on other voices contributing to social welfare policy, other venues for action, and other types of political engagement. Presenting testimony and lobbying Congress are only a few of the strategic choices available to advocates. The volume mentions the wave of antihomelessness protests that were launched during the early 1980s, but the author doubts that protest would have had much effect in the late 1990s, given the Republican majority in Congress (p. 232). Yet much of the mobilization in the early 1980s came in direct response to the polarizing rhetoric of a strong Republican president. Similarly, the current surge in anti-globalization protests has emerged in direct response to a strong pro-business and anti-labor political climate. If Hays ultimately intends the volume to be a call for more direct participation in politics (p. 9), it would have been useful to analyze the effectiveness of a broader range of mobilization efforts with differential transaction costs.

In Declarations of Dependency, Zundel argues that U.S. poverty policymaking bears the imprint of a "civic republicanism," in which small farm owners are held up as models of civic virtue because they are tied to the communities in which they live, are motivated by foresight, and-through thrift and hard work—are able to achieve economic independence (p. 122). The author argues that both the public and policymakers continue to attribute these civic virtues to small landowners, despite the shrinking place for small-scale agriculture in the U.S. economy (p. 121). Zundel traces the influence of this civic republican tradition through the Homestead Acts, through homeownership programs for the poor, and to more recent proposals to expand the productive assets of lowincome people through microcredit associations, tax-exempt capital development accounts, and employee stock purchase plans. Zundel's work makes a compelling case that the image of the homesteader continues to permeate antipoverty policy, and that the durability of this image appears to be independent of the actual legacy of the homesteading acts.

Most of the best land offered to homesteaders, for example, was taken very early in the nation's history (p. 39), and the majority of the remainder was not suitable for farming. Further, there were a great many instances of fraud, with businesses filing false claims and then stripping the lands of their timber or mineral resources before abandoning them. Congress also used the acts to deed an additional 100 million acres to those already granted to the railroads (p. 40).

In spite of the uneven policy implications of the Homestead Acts, Zundel demonstrates that the frame surfaces again and again: for example, in land reform schemes (e.g., the 1937 Bankhead-Jones Farm Tenant Act) and in proposals to promote homeownership by the poor (e.g., the 1919 "Own Your Own Home" campaign designed by the Department of Labor and the National Association of Real Estate Boards).

As with the Hays monograph, Zundel's work hints at the overarching importance of social and political factors in explaining the rise and fall of these individual reform movements. He notes that policy proposals depend on open "windows of opportunity," which can result from contentious politics (p. 49), patterns of partisan control of political institutions (e.g., the "stunning Republican takeover of both houses of Congress" [p. 97]), levels of issue salience and media attention (p. 112), and the presence or absence of powerful allies (pp. 112–13), as well as shifting employment patterns (p. 40).

But, again, these factors are mentioned largely in passing, and the work does not offer a coherent theoretical framework for understanding the ways in which these contextual factors influence patterns of policymaking, the reception that various policy proposals will receive, or the conditions under which challengers—employing this or some other frame—will gain policy concessions.

Without such a framework, the monograph is unable to explain why certain policy entrepreneurs have been comparatively successful at employing this frame in particular historical eras. If Zundel is right that the frame itself is enduring, then a significant part of the story concerns the conditions under which policy proposals in this tradition have captured the public imagination and leveraged political concessions, and the conditions under which they have not. What should we make, for example, of the short history of Reconstruction efforts to make public lands available for homesteading by freed slaves in the south (p. 39)? Certainly this effort fell directly within the civic republican tradition, and gained strong backing from Radical Reconstructionists in Congress. The reasons behind the weak implementation and ultimate reversal of this set of policy proposals might provide analytical heft to Zundel's argument by suggesting the boundaries of the power of the civic republican frame.

The analysis would also benefit from a consideration of the terms under which other dimensions of "deservedness" have come to dominate discussions of poverty and of effective social welfare policy. The narrative is largely silent, for example, on social welfare policies built upon attributions of civic virtue associated with military service (Theda Skocpol, Protecting Soldiers and Mothers, 1992), or participation in public or civic work (Harry C. Boyte and Nancy N. Kari, Building America, 1996; Daphne Spain, How Women Saved the City, 2001).

Ultimately, these two works are useful additions to the literature in the field, and are interesting companions to each other. They offer different perspectives on critical inputs to the same policy processes—during overlapping time frames—and provide two distinct vantages on the relationship between effective and vigorous citizenship and social welfare policymaking. Finally, taken together, these works make a striking case for the need for more integrated efforts to build a theoretical understanding of the mechanisms that link dimensions of social and political context to the routines and processes of incremental public policymaking.

Adversarial Legalism: The American Way of Law By Robert A. Kagan. Cambridge, MA: Harvard University Press, 2001. 339p. \$49.95.

Ronald Kahn, Oberlin College

Robert Kagan has three main objectives in writing this book: to demonstrate that the American systems of criminal and civil law, social welfare, and environmental regulation are dominated by "adversarial legalism," to critique and explain why it has taken hold in the United States, and to make proposals for reform in light of findings in the United States and the advanced capitalist nations of Europe, the Commonwealth, and Japan.

Drawing upon his own research and other previously published single nation and cross-national studies, Kagan suc-

ceeds in demonstrating that the United States, compared to these other nations, is dominated by adversarial legalism in its criminal and civil justice systems and its implementation of social welfare and environmental policy. Kagan argues that adversarial legalism is the term that best describes American legal systems and policy implementation because they are dominated by costly, stressful, and inefficient litigation fostered by politicized lawyers who rely on detailed prescriptive legal rules and formal processes of contestation. These result in plaintiffs in civil suits making outrageous demands for damages, prosecutors proposing long prison terms resulting in plea bargaining, and corporations and public interest groups using the courts to secure their interests from government and those with fewer resources failing to pursue their interests.

A superb critique is offered of the process of adversarial legalism in the United States. Kagan views adversarial legalism as a functional, more negative, equivalent to large central legal and regulatory bureaucracies of trained experts and judges found in these other democratic, capitalist nations. The major drawbacks of the process of adversarial legalism in the United States include legal malleability, uncertainty, and unpredictability and time-consuming delays that impose economic and social costs on people who can least afford them and benefit those with resources to enter the legal and regulatory process. He demonstrates forcefully that adversarial legalism impedes and increases the costs of bringing and settling civil and criminal disputes, securing economic development, and providing benefits to welfare recipients and improving the environment. He also argues that the process of adversarial legalism fosters adversarialness between business and labor, between government and citizens, and among corporations and levels of government. Adversarial legalism encourages unclear legislation, so groups and citizens must go to courts to secure benefits and protect their interests, and fosters legislatures to expand the right to sue government, corporations, and professionals such as doctors. This has a chilling affect on the establishment of less costly, user-friendly, informal bureaucratic and court processes.

Kagan reviews the elements of American political structure and culture that further adversarial legalism. Kagan argues that adversarial legalism is fostered by the following structural aspects of the American political system, compared to these other nations': far more fragmented, decentralized, nonhierarchical, and political courts and bureaucracies, with different outcomes likely at the national, state, and local levels of government; and strong interest groups, weak parties, and a weak state, rather than the strong central state, bureaucracy, and neocorporatist cooperation among interests such as labor and business found in other capitalist democracies.

Kagan argues that American political culture spawns a legal culture that views law, courts, and regulation, as malleable, fallible, and the product of continuing political battles rather than the application of universal standards through rational decision making. Lawyers' engagement in adversarial legalism and the rejection of compromise and cooperation among parties in a dispute is caused by a fundamental tension between a political culture that expects government to protect citizens from serious harm, injustice, and environmental dangers ("total justice") and a second set of values that emphasize a mistrust of concentrated power in government that requires limits on government authority. As a result, lawyers convince the public that adversarial legalism is the process needed to fight injustice and arbitrary government.

Kagan is less successful in arguing that the United States would be better off without adversarial legalism and with a system of civil and criminal justice and social welfare and environmental regulation that is found in Europe, the Commonwealth nations, and Japan. Part of the reason for this

is that Kagan moves back and forth between process and outcome-based standards of evaluation when making comparisons. In his analysis of criminal and civil court systems, Kagan defines injustice, in process terms, as the condition when parties feel compelled to abandon legally justifiable positions to avoid the costs and uncertainties of adjudication. When Kagan discusses the implementation of social welfare laws, he introduces an outcomes standard of evaluation. Kagan writes, "It [adversarial legalism] has not proved capable of producing significant effects on levels of, or gaps in, benefits and services" (p. 175).

Unfortunately, the small-n cross-national case studies Kagan relies upon to make the argument against adversarial legalism and for a European nation-like legal system do not provide systematic evidence of whether, and under what conditions, the poor, government, and corporations are the winners and losers overall. Nor can such studies explain whether inequities are the result of the negative aspects of the adversarial legalism as a process, differences in political structure, or different political cultures. The studies that Kagan draws upon simply do not provide systematic evidence of distribution differences among institutions and citizens in the United States and compared to these other nations. The linkages among process, structure, and political culture are not clear enough to make such determinations.

Nor is evidence presented of process and outcome injustices in the criminal justice, tort, and regulatory systems of the nations of Europe, the Commonwealth, and Japan, to which the United States is compared. Therefore we cannot assess the process and outcome injustices in these nations with less adversarial legalism when we make comparisons with the United States. For example, we need to assess the impact on legal certainty, stability, and justice in England that is caused by the power of the House of Commons to change civil liberties, civil rights, and criminal procedures overnight and the impact of European Union courts and bureaucracies on the English legal system and regulation process when comparing the United States and Britain. These problems raise questions whether the American criminal justice and tort law system and social welfare and environmental regulation systems come up as short as Kagan suggests when they are compared to other advanced capitalist nations' systems.

Finally, Kagan has not demonstrated that adversarial legalism is the primary cause of injustice whether measured in process or outcomes terms. With regard to social welfare, Kagan admits, "Adversarial legalism is not the cause of the grudging and incomplete character of the American social welfare system. It can more properly be viewed as a consequence—the response of politically liberal lawyers and judges to a political system that has not provided a nationally uniform, broad-based regime of social and health insurance, public housing, and generous employee benefits" (p. 175). However, Kagan argues that the response by the political system to social welfare policies is due to a political culture that spawns an individualistic, not a collectivist, vision of individual needs and agency. If this is so, then reducing the effects of adversarial legalism in individual decision-making processes, while the political and (resulting) legal culture remain unchanged, may produce little substantive change. It may, perhaps, ensure more justice as that is defined in process terms, but less outcome justice.

Moreover, we would have to discount expected declines in legal advocacy and resources for groups involved in such advocacy with the introduction of central legal bureaucracies and other efforts to reduce adversarial legalism in the United States. However, Michael McCann provides clear evidence that fear of lawsuits and legal advocacy, the core elements and structural consequences of adversarial legal-

ism, resulted in increased allocations by government with regard to equal pay for women in Washington state (Michael McCann, *Rights at Work: Law and the Politics of Pay Equity*, 1994). Would this economic redistribution have occurred if adversarial legalism were abandoned and we placed our trust in a political system dominated by what Theodore Lowi has called "interest group liberalism?"

If we do not know whether process and outcome injustices are primarily caused by the political structure or culture, then we cannot know whether changes in political structures and processes will produce declines in either type of injustice. Therefore, it is hard to determine whether the reforms that Kagan advocates, such as establishing better-trained, centralized legal bureaucracies at the state level and introducing a loser-pays system into tort law, would reduce or increase injustice. Perhaps more research on the linkages among political culture, political structures, and legal and policy implementation systems in the United States and other advanced capitalist nations would provide a firmer foundation on which to make a determination whether replacing adversarial legalism with legal structures and processes from other advanced capitalist democracies is the best course to follow.

**Dreams of a More Perfect Union** By Rogan Kersh. Ithaca, NY: Cornell University Press, 2001. 358p. \$39.95.

Robert W. T. Martin, Hamilton College

Rogan Kersh's ambitious and well-researched book traces the history of the concept of American national "union" from the middle of the eighteenth century to the end of the nineteenth century, when the concept lost the peculiar force it had had and fell out of use (more or less replaced by such concepts as "nation," "country," and, especially, "America"). The analysis demonstrates how the concept of national union has been used in exclusive as well as inclusive ways. The subject is an important one, especially to an America united by terrorist threats. And it is a topic made more conspicuous in the last decade by our ongoing discourse over multiculturalism. So the concept of national union is perhaps less obscure and more relevant than Kersh suggests (p. 3). Connections to the recent work of Rogers Smith (Civic Ideals, 1997) are also apparent. Still, the term itself has been out of favor for about a century now, so Kersh's study is a welcome effort to get us thinking about a relatively novel topic.

In breaking new ground here, Kersh's excellent and wideranging book speaks to a number of audiences. Scholars of American political development will learn much from the book, and those who study multiculturalism will find intriguing the twists and turns taken by the concept of national union. Dreams of a More Perfect Union will interest conceptual historians with its well-researched example of conceptual growth and decline. All of these audiences, and lay readers of American history, will benefit from this book. Many may find themselves wanting even more, their appetites whetted, but that is to be expected. Tracing such a broad and important topic over a century and a half is a monumental task that naturally raises more questions than any one book—no matter how well crafted—can hope to answer.

Kersh examines the rise and eventual decline of the concept of national union, mapping its impressive staying power, even to the verge of—and immediately after—the Civil War. Readers follow the concept's emergence in the middle of the eighteenth century, and its brief fading in the face of Tory praise of transcontinental union in the 1760s. We then see how the concept grew in importance, despite the vast cultural (not to mention practical) distances between regions during the early nineteenth century. In many ways, the concept itself

was the glue that bound the country together. Yet national union all but disappeared in the 1890s. Radical Republicans and African Americans abandoned the term after their egalitarian vision of a moral union was widely rejected by white America. And then the word was co-opted by an emerging labor movement.

To trace this underappreciated history, Kersh uses a powerful mix of methodologies and levels of analysis. First, there is the qualitative investigation of exemplary central figures, such as Madison, Webster, Douglass, and Lincoln. This analysis is then augmented by a broader reading of less elite writings in newspapers and other popular sources. This is all pretty standard; but Kersh adds to the mix a more systematic study of the proportional use of the concept in a sample of representative newspapers. The outcome of this methodical analysis is a number of graphs charting the ebb and flow of national union's political and rhetorical salience. As a result, Dreams of a More Perfect Union is more historical in temper than many conceptual histories, which tend to focus almost exclusively on important philosophical contributions and advances. If the work is less dramatic than a study of bold innovations, it is more historically precise, detailing even periods of relative conceptual stasis.

A number of important findings emerge. For example, Kersh occupies a well-supported middle ground between those who see early American thinkers as mere borrowers of the European tradition and those who view American thought as wholly unique. The indefatigable liberal/republican debate is shown to miss a great deal about the American visions of national union. Another contribution should be mentioned as well: Conceptual historians are here given a rich new example of conceptual demise from which to learn. They might, however, wish he had drawn more substantial connections to existing approaches to conceptual history (pp. 282–83).

Kersh's empirical sample and content analysis is methodologically innovative and quite valuable. His sampling technique involved studying representative newspapers' issues for the fifth day of January, April, July, and October (every other year, 1750–1900) and calculating the proportional use of the concept of national union per newspaper page. A number of adjustments were required to fill out the samples (pp. 20, 305), so the result is only "an informal sense of union across time and place" (p. 20). But that is enough to demonstrate the power and longevity of union as the conceptual tool for understanding American federalism. For instance, although profound transformations after the Civil War remade America, it was still conceived of—in both North and South—not as a nation, as many scholars suggest, but as a union.

These and other significant findings supported by Kersh's methodology are generally augmented by his careful use of even the most recent research that touches on any aspect of this broad study. One notable exception to this attention to the scholarly literature involves the concept of the public sphere. Kersh analyzes at length James Madison's notion of affective union and demonstrates its powerful influence throughout the nineteenth century. Yet Madison's vision of the union was not built solely on affect, but even more so on public reason engendered by political discourse. Saul Cornell's (1999) The Other Founders documents some Anti-Federalists'—and later Madison's—understanding of the role a vibrant public sphere could play in unifying the country. Similarly, although Lance Banning's (1995) Sacred Fire is cited to support Kersh's unionist reading of Madison, Banning's stress on Madison's liberal republicanism and vision of the public sphere is ignored. Ultimately, the role of an animated public sphere as a unifying force in the polity seems underinvestigated.

Dreams of a More Perfect Union closes with brief reflections on the prospects for American national unity and an assessment of whether religion or a sense of patriotism might be the source for our future civic bonds. In his surefooted way, Kersh then turns to Walt Whitman as the preeminent American theorist of unity in diversity. The questions raised are all the more pressing in light of the recent flag-waving that reassured a terrorized Union; and if this ambitious and informative study cannot answer all of them, it does provide the basis for approaching these crucial challenges in a sophisticated, well-informed, and intelligent way.

Hitching a Ride: Omnibus Legislating in the U.S. Congress By Glen S. Krutz. Columbus: Ohio State University Press, 2001. 183p. \$60.00 cloth, \$22.95 paper.

C. Lawrence Evans, The College of William and Mary

In recent decades, roughly 25 percent of major bills considered by the U.S. Congress have been omnibus measures—large, often unwieldy, legislative vehicles that touch on multiple policy areas. The 1981 reconciliation bill, which included much of President Reagan's economic agenda, is perhaps the best-known example. But many important policy proposals, from crime control to welfare reform, have passed as part of omnibus legislation.

Critics argue that these megabills undermine deliberation and that the practice should be curtailed. For one, members of Congress are seldom able to secure separate votes on the component parts of an omnibus measure because of chamber rules, leadership pressure, and ignorance about what these massive bills actually contain. The omnibus strategy also reduces the policy discretion of the executive branch. A president can either veto the entire package, including must-pass items that the administration supports, or sign into law a grab bag of unrelated items, perhaps including major legislation opposed by the administration.

There is, however, another side to the omnibus story. On Capitol Hill, the passage of legislation is complicated by overlapping committee jurisdictions, budgetary constraints, a crushing legislative workload, rampant obstructionism, and, according to some, our national tendency toward divided government. By streamlining the legislative process, the omnibus strategy provides congressional leaders with a valuable tool for overcoming gridlock and competing for power with the president. According to this view, omnibus legislating is an important institutional adaptation to the practical difficulties of lawmaking in the contemporary Congress.

What factors explain the rise of omnibus bills in Washington? How do the consequences of omnibus legislating vary, depending on the scope of the measure, the context of consideration, and the issue areas under focus? What strategic calculations determine when and how congressional leaders will construct an omnibus measure, as well as the response of other legislators and the president? Are bills in certain issue areas particularly likely to be considered via the omnibus? On balance, does the strategy strengthen or weaken the legislative process? Scholars seeking answers to these and related questions should begin with Glen Krutz's excellent book on the topic.

This book is an important addition to the literature for a number of reasons. First, the author stakes out important new territory for systematic analysis. Prior to this study, no one had developed a workable definition of what constitutes an omnibus bill, and generalizations about the practice have been based mostly on anecdotes, such as the 1981 reconciliation measure. Krutz's definition—rooted in the scope and length of a bill—makes good intuitive sense, and it can be

operationalized, generating valuable insights about Congress. The 1981 reconciliation bill, for instance, was not a turning point in the emergence of the omnibus practice. Instead, the percentage of omnibus measures (among major bills) grew gradually during the 1950s and 1960s, began to increase sharply during the mid-1970s, and then leveled off during the 1990s. It is interesting to note that the rise in Senate individualism and obstructionism that occurred during the 1970s corresponds nicely with Krutz's time series, helping to explain why congressional leaders increasingly resorted to the omnibus strategy.

A second strength of the book is the author's attempt to relate omnibus usage to leading theories of legislative behavior. Krutz distinguishes between two broad categories of theory. Purposive explanations, which he also labels "political" and "micro-level," emphasize the strategic calculations of individual members. Included here are the distributive and partisan theories of Congress. Organizational explanations, in contrast, are characterized as "macro-level," and place a greater emphasis on institutional adaptation and chamber efficiency. Krutz posits that both categories of explanation are necessary to understand omnibus legislating. He develops a hybrid conceptualization that yields a number of hypotheses about the factors associated with omnibus usage. For the most part, these hypotheses are supported by data, providing further evidence that no single theory can explain the central elements of Congress.

Third, the author compiles extensive new data about omnibus legislating. For instance, he marshals evidence about more than three thousand bills that received serious consideration by Congress from 1949 through 1994, and conducts a multivariate analysis of the factors influencing whether or not these items were considered via omnibus packages. Purposive factors help explain these data. Partisan theories, for example, generally imply greater minority party obstructionism when the majority party is relatively small and divided and the minority party is relatively large and unified. Overcoming such obstructionism is a key motivation behind the omnibus strategy. As expected, Krutz finds that individual bills are more likely to be added to omnibus measures when these conditions are met. However, organizational explanations, such as issue fragmentation and the size of the budget deficit, also have a statistically and substantively significant relationship with omnibus usage. In other chapters, the author conducts multivariate analyses of the incidence of omnibus bills by Congress, the impact of omnibus usage on legislative productivity, and the consequences of the strategy for congressional or presidential dominance over legislation.

Fourth, and most important, *Hitching a Ride* provides scholars with highly useful guidance for further research. The logical structure of Krutz's conceptual framework should be further developed. He argues that the construction of omnibus bills derives from two sets of strategic interactions: between congressional leaders and rank-and-file members and between Congress and the president. But the precise nature of these interactions—from actor goals and informational endowments to procedural constraints and the bargaining sequence—are not really spelled out in this book. The economics literature about commodity bundling and recent theoretical work by political scientists on legislative bargaining should inform scholarly efforts to build on the conceptual groundwork in this study.

Moreover, the rules that structure the consideration of omnibus measures vary somewhat from bill to bill and over time, and these differences receive only passing attention in this book. Reconciliation measures, for instance, provide the most consequential forum for omnibus legislating, and they are qualitatively different from the other megabills that Krutz

considers. (Reconciliation occurs via expedited procedures, and no filibusters are allowed.) We need more empirical research about the impact of structural arrangements on the construction of legislation, including omnibus packages. In this very impressive book, Glen Krutz provides us with a model for how such research should be conducted.

The Great Divide: Religious and Cultural Conflict in American Party Politics By Geoffrey Layman. New York: Columbia University Press, 2001. 435p. \$49.50 cloth, \$22.50 paper.

Ted G. Jelen, University of Nevada, Las Vegas

Analysts of religion and American politics have been awaiting this book for some time. In *The Great Divide*, Geoffrey Layman brings together two strands of research in American political behavior in an elegant, systematic fashion: the study of party system change (often described as the literature on "party realignment") and the analysis of religion in politics in the United States (long something of an esoteric speciality within political science). While Layman is not first to address the connection between the pew and the precinct, his impressive effort is at this point the authoritative source on religion and contemporary party politics.

The volume can be described rather simply. Using a variety of secondary data sources, Layman shows that the Republican and Democratic parties have become more internally homogeneous, and more distinctive, with respect to a variety of issues relating to traditional morality: abortion, women's roles, pornography, gay rights, and others. These changes have been taking place since the late 1960s and are manifested in the attitudes and behavior of political elites and mass publics. While the changes do not rise to the level of a "critical realignment," the manifestation of a "culture war" between traditionalists and progressives is a classic illustration of gradual party system change through "issue evolution."

This volume has at least two outstanding strengths. First, Layman provides a rather comprehensive description of recent changes in the party system, which incorporates analyses of both mass and elite political behavior. He convincingly demonstrates that the attitudes of political elites (delegates to national nominating conventions and members of Congress) and mass publics vary together, and he makes a plausible case for the direction of causality. Layman argues that changes in the basis of party cleavages are generally initiated by strategic candidates and leaders who stand to benefit from new alignments. Voters, in Layman's account, generally react to the changing cues provided by political leaders. Layman's description of recent changes in party cleavages is thoroughly grounded in the literature on party realignment, which makes the work quite relevant and accessible to political scientists.

A second strength of this book follows from the first. For several reasons, this is a book by a political scientist for political scientists, which means that Layman's analyses are quite accessible to readers who are not specialists in the religionpolitics subfield. As such, Layman has provided an important service to scholars who may be quite willing to acknowledge the importance of religion to contemporary party politics (a connection which by now seems virtually self-evident), but who, quite understandably, do not wish to devote the balance of their careers to the operationalization of religious variables. Scholars who specialize in the study of religion and politics will find relatively little new here but will surely admire the clarity and breadth of Layman's vision. Analysts of party politics in the United States who wish to take into account the role of religion will find their task made much easier by Layman's contribution.

To illustrate, at the conceptual level, Layman provides an excellent, self-contained description of the difference between the "ethno-religious" account of religious politics (in which membership in a particular religious tradition is paramount) and the more recent "culture wars" literature (in which a progressive-traditionalist cleavage cuts across denominational lines). In a clear, yet nuanced, analysis, Layman shows that the culture wars cleavage is becoming the dominant religious division in contemporary American politics, but that vestiges of the older, community-based alignment persist among African Americans, some white Roman Catholics, and Jews. Methodologically, Layman provides a plausible ordinal measure of religious orthodoxy that is based on denominational affiliation and church attendance. This measure is carefully validated with attitudinal measures from more recent surveys, and it permits Layman (as well as other scholars) to perform time-series analyses using surveys that contain fewer religious variables. The work contains extensive methodological and statistical appendices, which provide sophisticated analyses for those interested in the details of Layman's empirical research without detracting from the readability of a very well written volume.

While The Great Divide contains no glaring weaknesses. it seems appropriate to point out a couple of limitations to Layman's impressive effort. First and most importantly, this is a book about party politics, and readers are advised to generalize his analyses to other aspects of American religious politics with appropriate caution. For example, Layman's relatively simple index of doctrinal orthodoxy is quite useful in explaining variations in the attitudes and electoral behavior of voters and political elites, but it may be less helpful in other settings. If one is interested in explaining attitudes toward objects of the Christian Right (such as support the Christian Coalition or Pat Robertson), or in accounting for variations in the pro-life movement, the empirical picture might be somewhat more complicated. Other works (such as Clyde Wilcox's earlier book, God's Warriors, 1992) have shown that the interest group politics of doctrinally conservative Protestants are often fragmented by arcane (at least to those outside the evangelical tradition) doctrinal disputes or interdenominational rivalries (a phenomenon termed "religious particularism" by sociologists of religion). Layman shows that political parties in the United States do aggregate interests (or, more accurately, values), and this characteristic of American parties simplifies the task of the researcher enormously.

Second, Layman's work contains relatively little in the way of explanation of the independent variable: religious beliefs and values. Why the cleavages subsumed under the "culture wars" rubric are manifested in the party system (in contrast to social movements or religious revivals) is an important question that awaits further analysis. His explanation—that these religiously-based values cleavages were exploited by strategic political elites—is quite promising, but ultimately incomplete. Why did political entrepreneurs find such fertile ground in the politics of morality, and how did this set of issues displace others on the political agenda? Layman offers some anecdotal evidence (most specifically, in the activist base of the McGovern campaign in 1972), but a more complete explanation of the social changes that made possible the political change described in the book remains to be completed.

All this is simply to suggest that the work to relate religious memberships, attitudes, and behavior will continue. Layman has provided an excellent account of recent changes in the American party system, which will be indispensable as religion continues to command the attention of political scientists.

Elements of Reason Edited by Arthur Lupia, Matthew D. McCubbins, and Samuel L. Popkin. Cambridge: Cambridge University Press, 2000. 344p. \$64.95 cloth, \$22.95 paper.

Scott de Marchi, Duke University

Rarely is one invited to see the ingredients that go into the sausage, and if one plans only to eat sausage, this is an ideal situation. But the only way to *make* sausage is to take a close look at these ingredients, blemishes and all. Despite modeling shortcomings and disagreements that are evident among the authors, *Elements of Reason* is a remarkable book, both for its instructional value and the insight it offers into one of the most important problems in the social sciences.

Models of human decision making underlie almost all research problems, and currently, the debate is framed as a dichotomous choice between rational choice models on the one hand and bounded rationality models on the other. To the extent that Arthur Lupia, Matthew McCubbins, and Samuel Popkin expose this dichotomy as false, and provide an infrastructure for building better models, this book is a muchneeded contribution. It seems to me that studying this book, blemishes and all, is far more worthwhile than engaging in the silly debate about whether humans satisfy the axioms of rational choice theory. Given how many instructors assign Donald Green and Ian Shapiro's Pathologies of Rational Choice Theory (1996), there is a real need for a book that seriously discusses the potential for better models; Elements of Reason is by far the best such offering to date.

As noted, the first benefit provided by this book is instructional. Many of the chapters summarize and extend important research traditions within political psychology. Norman Frolich and Joe Oppenheimer discuss the role of ethics in decision making; Shanto Iyengar and Nicholas Valentino examine political advertising and source credibility; Wendy Rahn relates public mood to decision making; Milton Lodge and Charles Taber extend the on-line tally model to account for affect; Popkin and Michael Dimock investigate how different levels of information condition reasoning about international policy; and Mark Turner presents findings on conceptual blending. These chapters would benefit any advanced undergraduate or graduate class that examines decision making.

The other benefit of the book is to provide building blocks for new models of decision making. In the tradition of Herbert Simon, the editors seek nothing less than models that explain human choice. Given this goal, the best way to evaluate the success of various research agendas is to compare the predictive power of their models. In particular, proposed models should be compared to rational choice theory, which in many respects is the baseline model for the social sciences because of its claims of generality. This positive goal is in contrast to past research that simply aims to discredit rational choice, and the contributors of this book deserve praise for making this argument forcefully.

It is worth repeating that rational choice has been widely accepted in large part due to analytic simplicity. Any model of human decision making must provide two working parts. First, one needs an instantiation for the problems that humans confront. In rational choice, this instantiation is most often an extensive form game with explicit utility functions. Second, one needs a solution concept and an algorithm that "solves" a given problem; rational choice theory typically utilizes Nash equilibrium as the solution concept and backwards induction as the algorithm.

An enormous amount of research has focused upon whether humans can actually frame problems correctly (i.e., can we satisfy information requirements?) or apply the appropriate solution concept (i.e., can we satisfy computational

requirements?). It is abundantly clear that humans fail at both aspects of decision making as defined by rational choice. Further, a fair reading of the cognitive psychology and artificial intelligence literatures suggests that rational choice is not even a good approximation of how humans solve problems.

The problem is that it takes something to beat something, and that is what Green and Shapiro, and other critics of rational choice theory, have failed to recognize. The important point made by the editors of this volume, and more forcefully by Arthur Denzau and Douglas North in their chapter, is that the counterclaim to the above, that is, that humans are in many ways limited or less good than homo economicus, is also wrongheaded. Denzau and North point out that humans typically make choices in difficult environments with limited information; in fact, our performance in even relatively simple games, such as go or poker, defies scientific understanding. Computers have had some success in chess, but games of slightly more complexity stymie the best computer opponents.

This is important because computers are the best embodiment of rational choice theory I can think of—they instantiate games in extensive forms and solve them using variations on backwards induction (e.g., alpha-beta pruning). We thus find ourselves in a world where very powerful rational choice entities (i.e., computers) cannot drive to work, cannot play poker, and cannot really match human behavior in most simple activities, much less something as complex as running a political campaign or passing legislation in Congress. Denzau and North, along with the editors of this volume, argue that we need to stop mocking the afflicted and instead build better models. Additional guidance on this point is presented in a chapter by Philip Tetlock, where he argues that humans are cognitive managers, rather than misers, who cope with trade-offs and taboos in a sophisticated way.

There is, however, discord on this central issue across different chapters of Elements of Reason. In an astonishing chapter, Paul Sniderman critiques his own research program on heuristic use, and proposes that much of the heavy lifting humans require to make choices is instead accomplished by institutions. In many ways, Sniderman's argument follows that of Simon, who claimed that the algorithms underlying choice are not sophisticated, and that complex environments condition choices such that humans only appear sophisticated. Thus, humans cannot on their own steam use heuristics to simplify choices. Rather, political parties and other institutions simplify choices, creating the illusion of citizen competence. The mistake here is that we have existence proofs that Simon and Sniderman's account is incomplete. Humans perform extremely well at impossibly difficult problems, absent any guidance from the environment or institutions. Further, moving the spotlight to institutions is a shell game. Institutions are created and maintained by elites, who are simply a different set of actors making decisions in ways we do not

James Kuklinski and Paul Quirk follow Sniderman's lead in criticizing the political-heuristics and collective-opinion research. They correctly argue that much of the work in political heuristics falls into the category of "just-so stories"—we lack models that describe how heuristics are learned, modified, or stored in memory, and so instead, political psychology resorts to semiplausible reconstructions that fail not only on the grounds of cognitive plausibility but also on utility. Given their pessimism, it is surprising that the answer Kuklinski and Quirk propose is derived from findings in evolutionary psychology. This substitutes one set of just-so stories for another. Instead of clever heuristics, we have untestable stories

of how hunter-gatherer society conditions current political choices.

I have highlighted one area of debate with the pages of *Elements of Reason*, though there are others of equal import. This volume is engaging for the simple virtue that debate of this kind furthers research in a way that is seldom witnessed in the sanitized accounts presented in journals. *Elements of Reason* makes a considered argument for building better models of choice, and makes an enormous contribution by providing a shared framework for evaluating these models. Further, the contributors to this volume present work that points to several promising directions for future research. Disagreements strengthen the book by providing researchers with insight into questions that are still contentious.

Elements of Reason raises more questions than it answers, and all the authors, to varying degrees, fail to provide models that implement their ideas. Without precise models, rational choice theory will continue as the default model of decision making. An unanswered question in astronomy or metaphysics is that if the universe is expanding, what is it expanding into? Elements of Reason poses a similar question for social science: If rational choice theory is contracting, what has been left behind? We need answers to this question, and Elements of Reason makes important strides in providing them.

Political Consultants in U.S. Congressional Elections By Stephen K. Medvic. Columbus: Ohio State University, 2001. 224p. \$50.00 cloth.

Darrell M. West, Brown University

Political consultants have become an omnipresent part of the election landscape. Almost no prominent campaign emerges without a group of paid advisors who raise money, poll, design ads, and craft messages for the candidate. Yet despite the extensive visibility of campaign consultants, few empirical studies exist that attempt to measure the impact of this important player in American elections.

In his new book, *Political Consultants in U.S. Congressional Elections*, political scientist Stephen Medvic seeks to fill this gap in the literature. He focuses on two questions: what consultants do and how successful they are. Using case studies and empirical data, he looks at voting, fund-raising, and media advising. Unlike some others who have studied this phenomenon, he suggest that consultants are not as harmful to our political process as some observers have argued.

His major approach is what Medvic calls a theory of "deliberate priming." In this perspective, the author says that candidates emphasize specific themes to alter voter standards of candidate evaluation (p. 51). It is a process that is deliberate and self-conscious on the part of consultants. Through polls, focus groups, and ads, campaigners seek to alter the content of political races in ways advantageous to themselves. Appeals are made not to all voters, but to a subset of the electorate that is available to the candidate.

The book draws on a meticulously compiled general election data set. Taking advantage of federal laws requiring disclosure of campaign expenditures in federal races, the author develops a data set that includes the names of all consultants paid in two or more specific congressional elections (a criteria developed to weed out part-time consultants). Among other things, the data set included variables measuring the type of consulting service provided, the candidate's party, sex, incumbency status, previous elective office, the district presidential vote, the perceived vulnerability of the seat, the votes cast per candidate, the total votes cast in the race, wins

and losses, expenditures, and contributions (broken down by source).

Using these data, Medvic is able to develop a comprehensive look at congressional races in 1990 and 1992. Not surprising, winners were more likely to hire consultants than losers and to employ larger numbers of consultants per race. Media specialists and pollsters were the most likely consultants to be hired, followed by generalists, fund-raisers, and direct mail specialists. Interestingly, Democrats were more likely to hire consultants than Republicans. However, winning challengers were more likely than losing challengers to rely on consultants. There was no gender gap in reliance on campaign advisers.

The last part of the book seeks to measure the successfulness of consultants on election fortunes. To undertake this analysis, the author separates incumbents from challengers due to the well-recognized advantages incumbents bring to the electoral process in many areas. Using ordinary least-squares regression, Medvic models the incumbent's percentage of the vote by various campaign factors including whether or not each party's candidate employed a consultant.

The results reported in Chapter Five demonstrate that having a consultant significantly helps them run competitive campaigns. According to the analysis, challenges could reduce their opponent's vote by 2.7 percentage points merely by hiring a consultant. Since these results are independent of campaign expenditures, it suggests that consultants have an independent effect on election campaigns. In open seat elections, Medvic finds even more dramatic examples of consultant influence. Using multivariate models, he shows that Republicans in the early 1990s were able to raise their vote by 16 percentage points through employment of consultants.

Medvic deserves credit for undertaking a thorough, careful, and detailed study of the use and impact of campaign consultants. Although many observers make normative judgments about these hired guns, few inform their opinions with data analysis. In what surely was a laborious data collection effort, Medvic gets high marks for attempting to reach systematic generalizations about a subject that rarely goes beyond anecdotes.

The major thing I would have liked to see is some explication of the results beyond the 1990–92 period studied. In 1994, for example, House Republicans stormed the gates and took control of the House and Senate. What role, if any, did consultants play in this reversal of electoral fortune? It would have been interesting for Medvic to extend his analysis to this and later time periods to see if the patterns he found stood up or were idiosyncratic to periods of Democratic control of the House. If the latter were true, for example, it would point to contextual factors that are important for congressional elections.

In addition, I would have liked to see more development of the normative argument found in the closing chapter. In that chapter, Medvic suggests that consultants are not nearly as harmful to American democracy as frequently alleged. It would have been interesting for the author to speculate more generally about his results and explain why consultants should not be feared. Some, for example, blame consultants for the negative and misleading tone of election campaigns and the rising costs of gaining office. In what ways do his results speak to those fears and how do they refute them?

I would suggest that scholars interested in campaign effects take a close look at this book. The author tackles a difficult question and reaches some conclusions that are unconventional. His thesis deserves serious attention by campaign observers.

The Race Card: Campaign Strategy, Implicit Messages, and the Norm of Equality By Tali Mendelberg. Princeton: Princeton University Press, 2001. 320p. \$52.50 cloth, \$17.95 paper.

Vincent L. Hutchings, University of Michigan

Tali Mendelberg's *The Race Card* offers a methodologically rich and convincing account of the impact of subtle race cues in contemporary American politics. Although her thesis is a controversial one, Mendelberg develops a careful and cogent argument that racial attitudes can have a substantial effect on candidate evaluations—provided that candidates craft a racial appeal that appears to be about something other than race. She argues that the success of implicit antiblack appeals, ones juxtaposing visual references to race with ostensibly nonracial verbal messages on issues such as crime or welfare, are due to four "A" factors: ambivalence about racial stereotypes, accessibility and priming, awareness of one's reliance on racial attitudes, and the ambiguity of the racial cue.

According to Mendelberg, white Americans' ambivalence on racial matters springs from their simultaneous commitment to the norm of racial equality and their persistent acceptance of negative antiblack stereotypes. Thus, racial appeals are likely to be most persuasive when they evoke a racial reaction without appearing to violate this norm. Mendelberg relies on the extensive social psychological literature on accessibility and priming to show that it is through this mechanism that racial messages influence voters. That is, although many whites have internalized negative racial stereotypes, these attitudes are not necessarily brought to bear on political judgments absent some racial cue provided by political elites. Awareness of the racial intent behind political cues is important for Mendelberg because it can prevent the activation of antiblack attitudes. As she points out, a growing body of evidence suggests that attitudes can be primed without the conscious awareness of the individual. Indeed, socially undesirable attitudes on issues such as race may be especially susceptible to priming when the individual is not aware that he or she has been affected.

Finally, Mendelberg argues that political cues with an ambiguous racial message are likely to be more effective than explicit appeals (i.e., appeals where words such as "black" or "race" are used). This is because, when confronted with ambiguity, voters tend to rely on their own attitudes in order to make sense of the political world. If, as Mendelberg suspects, this applies to race-based appeals, then candidates will be most successful when their messages imply racial meaning without conveying it openly.

Perhaps the most notorious use of implicit racial appeals in contemporary politics is the Republicans' use of the "Willie Horton ad" during the 1988 presidential campaign, and much of Mendelberg's book is devoted to this issue. Anyone familiar with the 1988 campaign will recall that Horton, a black man serving time in Massachusetts on first-degree murder, assaulted a white couple, stabbing the man and raping the woman, during a weekend pass. Republicans used this tragic episode to argue that the Democratic presidential nominee, Massachusetts Governor Michael Dukakis, was soft on crime. Many also believe they used it to send a not-too-subtle message about the Democrats' stand on race.

Although not the first to provide an in-depth account of the Horton ad and its subterranean linkages to the Bush campaign, Mendelberg does provide a theoretically grounded assessment of when the Horton message should have been most successful. Utilizing a detailed content analysis of the period, she points out that although Horton's race and that of his victims were routinely provided in the press, the news media—and presumably the white public—did not interpret

this appeal as racial for most of the campaign season. It was not until late October when the Reverend Jesse Jackson, and later Democratic vice-presidential candidate Lloyd Bentsen, accused the Republicans of crafting a racist appeal that the news media skeptically aired this interpretation.

According to Mendelberg's theory of racial priming, the Horton ad should have been most successful in activating racial attitudes vis-à-vis candidate evaluations before Jackson accused the Republicans of racism, thereby transforming an implicit racial message into an explicit one. In order to test this theory, Mendelberg examines survey data during each of the three media phases of the Horton campaign: when the message received little attention; when attention became far more prominent, but remained "implicit;" and when the strategy was accused by Jackson of being racist, and hence became "explicit." Consistent with her theory, she finds that whites' attitudes on the Racial Resentment scale are most strongly associated with Candidate evaluations during the first two phases, but not in the third. In fact, the effects are substantively and statistically insignificant in the final phase of the campaign. Mendelberg concludes in this chapter that in order to counter the Republican strategy of race priming, the Democrats would do well to follow the example set by Jesse Jackson.

Mendelberg is well aware that the results from these analyses are not definitive. Clearly, the impact of racial attitudes on candidate evaluations did decline just as the Horton campaign shifted from an "implicit" stage to a more "explicit" one. Still, analysis of survey data does not allow her to rule out the possibility that some other, unmeasured factor accounts for this decline. In order to confront this possibility, Mendelberg designed a series of clever experiments set in either Michigan or New Jersey. Essentially, she randomly assigned her subjects to conditions either where they viewed news accounts of one candidate making an explicit appeal to racial attitudes (e.g., "Hayes says that people, especially African Americans, take advantage of welfare at the expense of hard-working taxpayers") or where they viewed the same candidate making merely an implicit appeal (i.e., visual references only).

The author deserves considerable credit for the ingenuity and care that went into her experimental designs. In addition to designing her entirely fictitious news accounts, Mendelberg also selected her subjects randomly from the phone book and then exposed them to the stimuli in their homes. Virtually no one in this subfield has gone to greater lengths to ensure that a study occurred under the most realistic conditions possible. In spite of all this effort, however, the results from these experiments do not resolve all of the unanswered questions from her survey analyses.

Mendelberg's experiments generally show that explicit appeals are far less successful at priming racial attitudes than are implicit appeals. Moreover, consistent with her theory, these effects seem to be driven by concern with norm violations and awareness of the racial content of the political message. One peculiar result from these experiments, however, is that racially liberal subjects who are not concerned when they are informed that their views violate the norm are far *more* likely to support the racially conservative candidate. This result does not fundamentally undermine the author's argument, but it does suggest that we need to know more about how and why norm violations moderate racial priming.

My greatest concerns with the author's experiments have less to do with what they show than with what they do not reveal. In my view, Mendelberg never directly tests the strengths and weaknesses of her core advice to Democrats: that the appropriate response to implicit racial messages is to unmask them. By showing that explicit messages are less effective—

although, significantly, not ineffective—she has shown that many whites will reject such crude appeals. However, I suspect that many readers will find that a candidate engaging in an explicit racial appeal is not the same as another candidate who labels an implicit appeal as racist. Indeed, as Mendelberg herself argues, the power of implicit appeals lies in part in their very ambiguity. This ambiguity makes it difficult to successfully label an implicit appeal as racist, particularly as the sponsoring candidate is likely to contest this charge. Also, I wondered whether Jackson's apparently persuasive effort to undermine the Horton ad was actually due to Jackson's accusation or Bentsen's. This raises the question of what types of Democrats (e.g., black or white, liberal or moderate, male or female, etc.) can successfully raise the charge of racism without the fear that it might backfire? Also, how successful will this strategy be in the South? In fairness, Mendelberg cannot be criticized for failing to address all of these questions, but they seem like an appropriate starting place for those who will wish to build on her work. Until these questions have been answered, I think the jury is still out as to whether unmasking implicit racial appeals is necessarily a winning strategy

With these important caveats aside, Mendelberg's book should be regarded as a major contribution to the field of race and politics. The theory is well grounded in the literatures of political science and social psychology, the supportive evidence is carefully analyzed and methodologically diverse, and the conclusions drawn are generally persuasive. Although Mendelberg's thesis will undoubtedly be regarded as controversial in some circles, her book goes a long way in providing compelling evidence that race, and racial attitudes, still matter in contemporary American politics.

Learning by Voting: Sequential Choices in Presidential Primaries and Other Elections By Rebecca B. Morton and Kenneth C. Williams. Ann Arbor: University of Michigan Press, 2001. 184p. \$55.00.

Lonna Rae Atkeson, University of New Mexico

While most elections in the United States are simultaneous (with all voters casting their ballots on the same day), there are elections, such as the presidential primary system, in which voters cast their ballots over an extended period of time. Sequential voting poses an interesting puzzle for scholars of voting behavior, particularly given the information flow of elections, but also the strategic considerations of what is effectively an iterated process over time. Presidential primaries are essentially a sequence or series of state party races that begin in early February and last until June of a presidential election year. Although not precisely the same as the presidential primary process, mail-in balloting or early voting, whereby some voters, especially stronger partisans, choose to cast their ballots prior to election day, offers another example of sequential voting in the United States.

As Rebecca Morton and Kenneth Williams argue, the advantage and unique feature of sequential voting is that voters later in the process have more information about the candidates, including horse race information, delegate totals, candidate trait, ideology, and policy information because of the preceding electoral events. This advantage may give later voters the opportunity to make more informed and perhaps even better decisions than they would have otherwise. On the other hand, sequential voting has potential negative consequences. Specifically, states or voters that go early in the process may have an undue influence on the electoral outcome, influencing that process in ways that undermine its representativeness and fairness. If this is so, then simultaneous elections are better because they equalize voter influence and maximize the

chance that the better-known candidates will win. Morton and Williams are interested in tackling the normative questions of this debate, assessing through the use of formal methods and experimental design the strengths and weaknesses of each voting system.

Morton and Williams do a decent job of describing the history of the presidential primary system and document the increase by states in front-loading, the move from a later primary date to an earlier date in order to have a greater influence on the outcome. As a result of front-loading, they argue, primaries are now virtually simultaneous elections. They also do a nice job of describing the history of "early voting," also known as absentee or mail-in voting, and attempt to build a case that makes it equivalent to the process of sequential elections found in the presidential nominating system. In Chapter 4 they do a thoughtful and interesting review of previous formal models of simultaneous and sequential voting.

Chapter 5 is where the real meat of their argument and analysis begins. As good formal modelers, they begin by outlining their assumptions and the implications of those assumptions on voter behavior. Their model assumes three types of candidates and voters: liberal, moderate, and conservative (though subjects know candidates as only x, y, or z). Information is constant in their analysis, but it is limited. Voters know about only one candidate and on the basis of that information must consider appropriate strategic choices. In the sequential model, voters in later contests have an additional piece of information: They know the outcomes of the earlier contests. In one case (designated high information), these later voters know how liberal, moderate, and conservative voters voted, and in the other case (designated low information), voters only know the aggregated outcomes of earlier voting.

To test their model, the researchers created a computerized election environment for subjects, providing them information about the candidate types, the payoffs, including information about how voter types rank the candidates, and the number of voters in each voter type. Subjects are also placed in risk-averse or risk-seeking groups based on payoffs. In the sequential experiment, "later"-voting subjects receive the additional information in the two cases described. The authors then test nine hypotheses about voter behavior within this constrained information environment, and the results are not always successful.

First, their best models test hypotheses related to simultaneous voting and are most applicable to a three-candidate, low-information general election race. These models, then, are especially useful in understanding local elections where there are often multiple candidates and little information. Their iterative model, though interesting and insightful, may not apply well to our understanding of presidential nominating campaigns. The reason is that this model and its payoff structure do not take into consideration that the presidential nomination campaign is only the first step in the selection process and that strategic considerations about the general election campaign may have an influence on voter behavior during the nomination campaign. In addition, their experiment misses the fundamental intraparty nature of a nomination campaign, how it is uniquely different from a general election campaign during which candidates can send clear cues about rational voting behavior. The electorate in a nomination campaign is not as ideologically diverse as it is in a general election campaign. Voters in a nominating campaign may have several good choices, and the different payoffs among candidates may often be very small or in some cases nonexistent, unlike a general election campaign in which the ideological and policy payoffs are clear.

Second, in their sequential game, the authors do not consider the fact that the presidential nominating game changes significantly over time as candidates withdraw from the race. These withdrawals are not reflected in the payoff structure. What happens in a nomination game is that eventually the race becomes largely a two-person, instead of a three-person or more, race. Thus, the winnowing aspect of the presidential nominating game is, at best, only partially represented by aggregate information about earlier voting decisions.

Third, the authors really try to stretch their theoretical framework by arguing that early or absentee voting is similar to a sequential race. In fact, it currently is not, and theoretically it is unlikely to evolve into a sequential process. Early voting results are not revealed to the electorate and cannot be used as a basis of information for election day voters. This factor diminishes the applicability of the iterative game to this process.

Despite these criticisms, this book serves as an important first step in considering the normative implications of sequential and simultaneous elections on voter behavior. It would be of most interest to election scholars, but also has some use for those teaching graduate method classes. In particular, I found Appendix A a good, though brief, introduction to formal modeling and experimental design. I also found the design of the experiment, its payoffs, and inherent assumptions very interesting and would like to see more use of experimental designs by political science researchers.

Disjointed Pluralism: Institutional Innovation and the Development of the U.S. Congress By Eric Schickler. Princeton: Princeton University Press, 2001. 356p. \$65.00 cloth, \$22.95 paper.

David C. King, Harvard University

For those of us who watch Congress and steep ourselves in its history, there are a handful of theories purporting to explain how and why Congress changes. Political parties behave like cartels gathering power at another's expense. Election-minded members shape Congress to ease the passage of pork-barrel bills and to trade votes. Congress often seems designed to encourage legislators to become policy experts, and their expertise is protected by deference to committees that fairly closely represent the interests of the whole House or Senate. For at least the last 15 years, and in the name of New Institutionalism, full-throated fans of various theories have been arguing over which one is "right."

In Disjointed Pluralism, Eric Schickler looks at the history of Congressional rules, committee structures, and Congressional leadership through the various lenses of theory. He emerges with an argument that none of the prevailing theories is really right all the time and none of the theories is really wrong either. That criticism is not new or by itself very helpful, but Schickler does everyone better in inducing a theory about how various interests engage in a continual interplay over congressional power.

The "pluralism" in Schickler's title is a bevy of "collective interests" that might spur innovations in Congressional design. These include political parties, chamber-centered interests, individual power bases, policy interests, and reelection interests. No one cause of Congressional change is predominant, and "disjointed pluralism portrays institutions as multilayered historical composites that militate against any overarching order in legislative politics" (p. 17). Furthermore, "congressional development is disjointed in that members incrementally add new institutional mechanisms without dismantling preexisting institutions and without rationalizing the structure as a whole" (pp. 17–18).

Schickler makes four claims about how Congressional institutions change, and each is successfully defended in case studies and through careful empirical work. First, several collective interests (or theories that have typically been offered) are in play each time there are important changes in Congressional institutions. Second, advocates of change in Congress appeal to multiple interests by, for example, fashioning temporary coalitions among believers in strong parties and members pursuing reelection. Third, new institutions typically layer on top of preexisting ones, so that exploring Congressional rules and procedures is not unlike an archeological dig, appearing "more haphazard than the product of some overarching plan" (p. 15). Finally, the whole system is dynamic in that changes promoting one collective interest (say, the desires of policy experts) provoke contradictory reforms from other collective interests.

Just as there is no overarching plan in the design of Congress, Schickler's theory itself seems disjointed and at times patched together from a plurality of interesting explanations, path dependency among them. I suspect that the book will not be remembered for its theory, unless the notion of path dependency can be more explicitly developed in subsequent articles. And I risk making an especially nitpicky comment here: The book would have been better labeled simply by what comes after the colon—Institutional Innovation and the Development of the U.S. Congress.

Why?

Schickler's theory reads more like an *ad hoc* explanation, but as a nuanced, rigorously researched and theoretically *informed* description of Congressional reforms, *Disjointed Pluralism* is a tour de force. Schickler covers reforms in four periods, 1890–1910, 1919–32, 1937–52, and 1970–89. The result is the best and most comprehensive work on Congressional reform since Joseph Cooper and David Brady were writing sweeping histories 20 years ago.

Schickler's research is exhaustive but never exhausting to read, and he blends case studies with logit analyses in ways that should be a lesson to us all. *Disjointed Pluralism* is now, and for some time will be, the definitive analysis of the history of congressional reforms since the 1890s. There are some jarring surprises, which Schickler argues convincingly. Notably, Schickler shows that in the late 1800s and early 1900s, an era of strong parties, partisan interests did not singularly drive Congressional reforms. Multiple interests, as in all other eras, were very much in play.

If Congressional reforms emerge from a mixture of collective motives, reelection interests play a minor role. Schickler categorizes 42 reforms, beginning with the adoption of Speaker Reed's rules in 1890, yet "there is surprisingly little evidence that members' shared reelection interest has driven development in the four periods examined" (p. 255). That conclusion may jar students of Mayhew's 1974 book (Congress: The Electoral Connection), but Schickler is a Mayhew devotee (and his former Ph.D. student at Yale). Indeed, throughout the four periods, Congressional changes seem driven by policy interests, the creation of individual power bases, a tug-of-war with the executive branch, and the flux of power between the parties. And as Schickler shows, when one constellation of interests makes a change, there is an almost-inevitable path-dependent reaction from the forces that lost in the previous reforms.

Disjointed Pluralism is, wisely, not teleological, but in arguing that new institutional structures are evermore layered on top of the old, Schickler misses an opportunity to explain when and why older edifices are explicitly exploded. Schickler is right that "the effectiveness of institutional change has repeatedly been compromised by the need to accommo-

date a preexisting authority structure that privileged other interests" (p. 252). But the word repeatedly in that sentence should not be read as "inevitably."

The development of legislative institutions does tend toward complexity and layering, but on occasion whole lines of precedents and whole sections of the rules are jettisoned entirely. This is most likely to happen early in a legislature's history, as we are seeing today with the Russian Duma, the Ukrainian Rada, and so on. Perhaps this dynamic would have been more evident in Congress had Schickler's analysis begun with the late 1700s instead of the 1800s.

That is too much to ask, I know, because Eric Schickler's attention to detail and careful analysis of the last 100 years is a wonderful achievement in itself. Thanks to *Disjointed Pluralism*, full-throated fans of various single-cause theories will have a lot to talk about.

The War Against the New Deal: World War II and American Democracy By Brian Waddell. DeKalb, IL: Northern Illinois University Press, 2001. 236p. \$39.00.

Donald R. Brand, College of the Holy Cross

This book argues that the transition from the New Deal to a mobilized wartime economy during World War II restored corporate hegemony in collaboration with a state apparatus dominated by military elites. The purported losers in this transition were New Deal reformers committed to a planned economy and an extensive social welfare state, and groups like labor and small business whose interests were represented by reform elites. Organized chronologically, Waddell's account traces the development of the military-industrial complex from the War Industries Board in World War I to what Waddell asserts is a neocorporatist pattern of governance that had become established by the late 1940s and early 1950s. For the intervening years, he devotes attention to the trade association movement of the 1920s, the National Recovery Administration in the early 1930s, the New Deal turn to Keynesian economics, Harry Truman and the Marshall Plan, and the National Security Act of 1947; but the book focuses on the three periods associated with mobilization for World War II. These three periods are prewar mobilization from September, 1939 to December, 1941; the institutionalization of wartime mobilization from early 1942 through early 1943; and the battles over postwar reconversion that began in 1943 and continued into the immediate postwar era.

Waddell has synthesized some of the existing secondary literature and supplemented it with material from published government sources to provide a coherent interpretation of the relationship of the New Deal to wartime mobilization; but his book will not, and should not, persuade anyone skeptical of his initial premises. He utilizes evidence selectively, cites literature that supports his thesis while ignoring literature that opposes it, and does not independently verify or evaluate assertions found in congressional committee reports.

One example of his selectivity is that there is surprisingly little attention to labor and labor unions in the war years. Instead, Waddell focuses on the plight of small businesses and their disadvantages vis-à-vis oligopolistic firms in securing lucrative government contracts. Labor unions only appear when they are playing second fiddle to big business in war production agencies or being asked to accept wage restraints white business profits mushroom. Doris Kearns Goodwin's (1994) No Ordinary Time presents a very different picture of the wartime years. She argues that "even as he reached out to business during the war years, Roosevelt insisted on preserving the social gains of the previous decade." Specifically,

his "partnership with business was not forged at the expense of American labor" (p. 608). Supporting her argument, she notes that labor unions added six million new members in the war years and that they emerged from the war with unprecedented organizational strength; and that many in labor made significant wage gains, notably automobile workers, who doubled their incomes because of labor shortages. Waddell should have addressed her thesis; he should have provided an alternative explanation for some of the facts and data that she provides to support her claims. Instead, he ignores her; he does not even include her book in his bibliography. Similarly, he ignores the claim made by Jordan Schwarz in *The New Dealers* (1995) that the New Deal disbanded the War Resource Board to preserve civilian control over defense preparations and to preserve New Deal principles under new circumstances.

One of the strengths of The War Against the New Deal is Waddell's recognition that the struggle between New Deal reformers and big business was genuine and fundamental. The New Deal was not simply rationalizing capitalism, and its efforts to enhance the regulatory capacity of the American state posed a serious threat to the interests and prerogatives of business elites. While Waddell appropriately recognizes that opposition to some of the regulatory agenda of the New Deal could unite big business, it is a mistake to portray big business as a homogeneous class with unified interests. Waddell acknowledges that business leaders must overcome collective action dilemmas if they are to pursue shared interests effectively, and he acknowledges ideological differences between corporate liberals and laissez-faire conservatives; but he underestimates other conflicting business interests. For instance, he does not explore the important sectoral differences that fragment business unity. He pays particular attention to steel, aluminum, and copper because these raw materials were rationed during war mobilization and the industries associated with them tend to be highly oligopolistic, but he ignores what happened in less regulated, less oligopolistic sectors of the economy like textiles. He does not adequately distinguish the interests of firms producing defense materials sold to government as the sole consumer from the interests of firms producing materials that could be sold to consumers. He needs to supplement his general analysis of government—business relations with industry case studies to provide a richer, more empirical account of the war years.

Waddell concludes that the "military-corporate alliance triumphed" and the state was stronger "at the cost of compromising and diminishing America's democratic character." (p. 3). He concludes his account of the evolution of civilianmilitary relations with Truman and the enactment of the National Security Act of 1947, but his sweeping conclusion would seem to require some explanation for Truman's firing of Douglas MacArthur in 1951. This was a major political episode in the Truman presidency, and it seems to testify to the preeminence of civilian over military control in the immediate postwar era. The claim that the militaryindustrial complex had "diminished America's democratic character" would also entail some demonstration that America's defense policy and defense spending in the postwar years did not reflect the preferences of democratic majorities responding to the growing, real threat of the Soviet Union. Waddell provides no evidence to refute this claim, just as he provides no evidence to refute alternative interpretations of the fate of reform aspirations in the wartime years. He makes no converts because he preaches only to the converted.

## Comparative Politics

Unemployment in the New Europe Edited by Nancy Bermeo. Cambridge: Cambridge University Press, 2001. 368p. \$70.00 cloth, \$28.00 paper.

Per Kongshøj Madsen, University of Copenhagen

The publication under review is the outcome of a Princeton University conference entitled "Unemployment's Effects" held in 1997. The themes of the chapters extend widely. Some authors focus on broad discussions of the possibilities for the "European model" to survive in a global economic setting, while others look at specific relations, for example, between unemployment and trade union strength, in just one European country. Some chapters have clear theoretical objectives, while others have a focus on empirical detail and statistical analysis. On the other hand, the majority of the chapters are related by a general positive view on the sustainability of the European model, even in the seemingly hostile environment of the global economy. Although the European welfare states and labor markets are often accused of being inflexible and hampered by "institutional sclerosis," they may also foster the development of a soft and kind capitalism—or organized managed economy-as Nancy Bermeo puts it in her introduction to the book.

A useful survey of the development of European labor markets over the last two decades is found in the contribution by David Cameron, who correctly points to the large discrepancies among the European countries when it comes to employment and unemployment performance. The following two chapters by Peter Hall and Martin Rhodes both argue the case for the organized market economy as a viable alternative to neoliberal capitalism. Hall provides a well-balanced discussion of the pros and cons of the two models, while Rhodes focuses on the effects of globalization on the European welfare states. Their positive attitude toward the "European project" is evident, but both authors argue their case in a balanced and well-documented fashion.

The next two chapters are written in the tradition of comparative quantitative macroanalysis. Bruce Western and Kieran Healy present results from an analysis of the wage slowdown in 18 OECD countries from 1965 to 1993, while Lyde Scruggs and Peter Lange examine the relation between unemployment and union density. The main message conveyed in both chapters is that "institutions matter." The process of wage determination is strongly influenced by the institutional setup. The same goes for the relation between unemployment and union density. Thus, countries where trade unions control the unemployment insurance system gain members during times of crisis. The opposite is true for countries with state-controlled benefit systems.

Then follow three case studies, of Portugal, Spain, and the Netherlands, by Allan Stoleroff, Javier G. Polavieja and Andrew Richards, and Steven B. Wolinetz, respectively. Though they all in one way or the other serve to substantiate the main argument of the book, they are also the least interesting to the general reader, mainly due to their great detail and lack of updated material.

The last part of the book is focused on a theme, political behavior, which is somewhat remote from the rest of the chapters. First, Christopher J. Anderson presents the results of a comparative study of political behavior of the unemployed in 12 member states of the European Union. Data are from 1994. He does find some differences between the employed and the unemployed part of the population, but neglects the fact that individual unemployment is not a stable situation. To the contrary, many persons move to and from unemployment during the year as a normal element of the functioning of the labor market. By example in the Danish case, about onequarter of the employees experience at least one spell of unemployment every year. Furthermore, those affected by unemployment differ from the average employee in a number of respects, especially by having a high probability of being low skilled. Thus, one must expect that the political behavior of a person who is reported as unemployed at a given point in time is the result of the interplay between a large number of variables, including the duration of the current unemployment spell, educational background, income level, and so on. Or to put it differently: It is hard to tell from the analysis presented here whether we are dealing with the political behavior of the unemployed or the unskilled ormore probably—the result of the interplay between a number of socioeconomic variables. This criticism is less relevant in the case of the following chapter by José Maria Maravall and Martha Fraile, who use four background variables to explain the voting behavior of the Spanish voters in the election in April 1995. Not surprisingly, they find that variables other than unemployment, including income, are of importance to voting behavior.

In the final chapter, the editor Nancy Bermeo sums up the main argument of the volume. There is no clear winner of the "battle of the systems." Contrary to the conventional wisdom, at least in some quarters, both coordinated and uncoordinated policy models are able to deliver the good in the form of lower unemployment. And furthermore, coordinated policy models and competitive corporatism have the merit of being more favorable to social inclusion and lower inequality. They are just a nicer place for common folks, which is of course a positive conclusion for the majority of the population that can be characterized as such.

It is rare to find a collection of conference proceedings that does not show some weakness when it comes to actuality and coherence. One striking feature, when looking back over the chapters of the present publication, is the limited discussion of the European Employment Strategy, which since 1998 has been an important element in the reform process of the European Union. Considerations of the expected enlargement of the European Union with up to 10 Central and Eastern European countries are also absent in the volume. These observations are not a criticism of the editor as suchbecause the two subjects mentioned were practically missing in the academic debates just a few years ago. But they still show the risk of a considerable time lag between publications about the "new Europe"—and what is actually going on in the new Europe.

These critical remarks should not, however, scare the reader away from the book. For those not familiar with this line of research, the publication provides a valuable and balanced introduction to important alternatives to the liberal free-market orthodoxy. Also, for those academics, students, and others who are already familiar with—and maybe sympathetic to—the alternatives to the neoliberal paradigm, this collection of papers gives a helpful survey of the views of some of the prominent scholars active in the study of the ongoing transformation of Europe.

Since the 1980s, global financial integration and the rise of neoliberalism have significantly changed the terrain on which European social democratic parties operate. However, fierce debate persists over the evaluation of these changes. Some observers—from widely differing political standpoints—insist that social democracy and the free movement of capital across national boundaries are fundamentally incompatible. It follows that the only options for social democratic parties are either to embrace neoliberalism and dismantle much of the welfare state or organize concerted action to reshape the global financial architecture. An opposing group of analysts are equally adamant that while the terrain has certainly become more difficult, it is still possible for Social Democrats to preserve much of the welfare state and even launch new policy initiatives.

All three of the books under review argue for some variant of this second position with differing combinations of normative and empirical arguments. While the arguments are often implicit, most of the authors appear to be skeptical of neoliberal claims that markets can truly be self-regulating. It follows that if actual global financial arrangements fall far short of neoliberal dreams, then there is still considerable room for governments to play an active role in shaping how markets work. It is within this space that Social Democrats are able to pursue policies designed to protect citizens from the market.

The three books share a further agenda in common; they all see Tony Blair's Third Way path for the British Labour Party to be misguided. Alex Callinicos's book is a straightforward polemic that elaborates Perry Anderson's insight that "the Third Way is the best ideological shell of neo-liberalism today" (p. 109). Callinicos considers that Third Way rhetoric is simply an effort to conceal Blair's actual agenda of dismantling what remains of the welfare state and providing unconditional support for U.S. initiatives in order to impose its vision of market liberalism on the rest of the world.

John Callaghan's book presents a more scholarly account of European social democracy over the past 40 years. But surprisingly, Callaghan's reference to "Refreat" in his book's title refers only to the United Kingdom. His conclusion argues forcefully that European social democracy is not in decline, either in terms of electoral support or the ability to achieve its policy objectives. While Callaghan recognizes that all of these parties have become more cautious in the current global environment, he insists that outside of the U.K., they are continuing to defend social democratic values. The book's real agenda is to show that Tony Blair is out of step with the rest of European social democracy. Callaghan argues that Blair and New Labour have gone too far in embracing Thatcherite ideas, even at a time when their European colleagues are effectively defending the welfare state and developing proposals to bring footloose global capital under greater control. Callaghan's book is particularly useful in detailing the leftward turn within social democracy in the major European countries in the 1960s and 1970s and in recounting the defeats suffered in the 1980s. However, the book would be considerably stronger had he focused more attention on explaining the root causes of the policy divergences between New Labour in England and Social Democrats in Germany and France.

The third book is an unusually strong collection of essays that provide in-depth analyses of the recent experiences of a range of different social democratic governments. The quality is uniformly high and the essays develop detailed and sophisticated analyses. Most of the essays analyze the recent history of particular countries—with specific essays covering the United Kingdom, France, Sweden, Austria, Greece, Spain, Poland, and the special cases of Australia and New Zealand. Andrew Glyn's introduction and the last three essays are broadly comparative and move toward a broader assessment of the issues.

The essay on New Labour by Glyn and Stewart Wood shares Callincos's and Callaghan's distaste for Tony Blair's Third Way, but in only 22 pages, it offers a more subtle and detailed analysis. The authors acknowledge, for example, that some of New Labour's policies, such as the Working Families Tax Credit, the introduction of a minimum wage in April 1999, and possibly, the efforts to move young people into employment, have actually benefited the poorest households in the U.K. But they go on to explain why these initiatives are unlikely to make a significant difference in England's high rates of economic inequality and chronically high regional unemployment. They also persuasively argue that New Labour's consistent effort to keep the trade unions at arm's length "has left the government without any means to encourage the kind of coordination of wage bargaining which appears to have played a significant part in a number of recent 'employment miracles,' the Netherlands and Ireland, for example" (p. 209).

But while Glyn and Wood are in considerable agreement with the other authors in their assessment of New Labour, the cumulative thrust of the essays in Glyn's volume suggests a somewhat more pessimistic assessment of social democracy on the European Continent than that provided by Callaghan. Specifically, the chapters on Spain, Greece, and France emphasize both the failure of recent social democratic governments to bring unemployment rates down and their gradual accommodation to orthodox monetary policies. To be sure, each of these essays also stresses the unique challenges faced by these parties, particularly those that were not building on established social democratic traditions. In Austria and Sweden—in contrast—the assessments are somewhat more positive, and a comparative essay by John Stephens and Evelyne Huber does provide strong evidence that cutbacks in social spending in social democratic welfare states have thus far been quite limited.

In short, most of these essays downplay the role of global political economic factors in explaining the timidity or failure of particular social democratic governments. But there are occasional acknowledgments that capital mobility and exchange rate policies do significantly constrain government policy options. These arguments are developed most fully in one of the comparative essays written by Torben Iversen. Drawing heavily on the Swedish case, he argues that the government's conversion to a fixed exchange-rate policy, in combination with the collapse of centralized wage bargaining, significantly constrains its choices. Specifically, he cites Peter Swenson's use of the "trilemma" concept to argue that under current circumstances, social democratic governments cannot simultaneously pursue full employment, income equality, and budgetary restraint. And he goes on to argue that accommodation to either unemployment or increased income inequality threatens to undermine the coherence of social democratic electoral appeals.

Ultimately, the three books are persuasive in making the case that it is domestic politics and not global financial integration that has led Blair and New Labour to take minimal action to reverse levels of economic inequality that are far higher than those on the Continent. At the same time, they fail to provide a direct and persuasive challenge to those who argue that global financial integration is pushing all economies toward higher levels of economic inequality and greater acceptance of unemployment. The closest thing to such an argument is provided by Adam Przeworski in an essay in the Glyn volume that argues that "[m]ost of the effects attributed to globalization are due to something else, many to technological changes" (p. 330). But Przeworski also acknowledges that there is still too little solid research to make such a statement with any degree of confidence. The issue of whether social democracy can survive another 20 years of global neoliberalism remains unresolved.

But the Callinicos book provides a perspective that the other books lack; he devotes considerable attention to the United States role in advancing global neoliberalism. In contrast to those who imagine that economic integration is creating some kind of unified global capitalist class, Callinicos sees U.S. actions through the lens of Great Power politics, and he also sees U.S. hegemony as increasingly fragile. One source of weakness is the U.S. economy's dependence on a stock market bubble that Callinicos correctly predicted could not be sustained. Another potential weakness is the possibility that secondary powers can create effective alliances that will significantly limit U.S. international room to maneuver.

Implicitly, Callinicos raises the big question—whether the neoliberal era that began with Margaret Thatcher and Ronald Reagan might actually be coming to a close. If the mantra of deregulation, privatization, and elimination of barriers to the free movement of goods and capital is losing its persuasiveness, then the whole question of whether social democracy can survive in this new environment could be moot. But even though neoliberalism appears increasingly to be on the defensive as an ideology and a policy framework, the global financial architecture continues to permit the enormous private flows of capital that discourage most governments from experimenting with any type of unorthodox economic policies. Moreover, since it is highly unlikely that the current Republican administration would agree to any significant changes in the current international financial regime, any progress toward a negotiated alternative to neoliberalism is years away. To be sure, reports of neoliberalism's death might well be exaggerated; the doctrine has proven to be remarkably resilient over the last quarter century.

Even so, Przeworski's essay has some interesting insights about how a new policy regime to replace neoliberalism might emerge. Earlier changes in policy regimes—such as the program that the Swedish Social Democrats campaigned on in 1932 or the innovations that Reagan and Thatcher pursued at the end of the 1970s—share several elements in common. First, the policy changes occurred during a period of economic crisis when voters believed that established policies had failed. Second, voters are persuaded that the political party favoring the new policy direction is responsible and has their best interest at heart. Third, the new government is blessed with a certain amount of luck in the period of implementing new policies. Przeworski recognizes that these dramatic breaks in policy regimes are rare, but the rewards to those parties with the courage to pursue this kind of risky path are substantial.

Przeworski implies that the "success" of a new policy regime in one country can lead to imitation in other countries and then a shift in the global financial regime that supports the new approach. It is significant that his approach places more causal weight on new policy ideas than on material conditions or political coalitions. Persuasive new ideas are the critical lever of historical change.

But Przeworski's emphasis on the centrality of ideas suggests a final observation about neoliberalism. A policy regime that is perpetuated by powerful institutions, but which is lacking in intellectual legitimacy, provides a fragile foundation for maintaining global economic and political order. The danger is that when crises occur, there will not be sufficient consensus among nations to negotiate effective responses. For this reason, even aside from the challenge of international terrorism, there is reason to fear that the early years of the twenty-first century might prove more turbulent and unpredictable than any time since the end of World War II.

The Other Mirror: Grand Theory Through the Lens of Latin America Edited by Miguel Angel Centeno and Fernando López-Alves. Princeton: Princeton University Press, 2001. 372p. \$59.50 cloth, \$15.95 paper.

Eduardo Silva, University of Missouri, St. Louis

Standing the assumptions and causal propositions of established theories on their head, with an eye to refining them or pointing us to other theories, is a fruitful path to quickening the intellectual pulse, to reinvigorating a field of study, and to contributing to knowledge. The Other Mirror makes an eloquent and persuasive case for midrange theorizing as a tool for revitalizing area studies in general and Latin American studies in particular. If area studies are to recover from their marginality in the general disciplines, area specialists must once again engage the theory-building enterprise central to the disciplines that house them. By concentrating on midrange analysis, area studies have real contributions to make to general theory.

In the introduction, Miguel Angel Centeno and Fernando López-Alves argue that general theory offers area specialists a sure guide for framing questions guaranteed to advance knowledge of key but poorly understood problems. It also orders reality on the basis of assumptions and causal relationships. Through the lenses of a wide range of classic theorists, the volume focuses on one of the most enduring problems in Latin American studies: the problem of social order. Because order is defined as "the assumed understanding that institutionalized rules will be both imposed and obeyed in a standard and universal way" (p. 13), the editors make a case for focusing research on institutional development, specifically the persistence of political instability and weakness.

However, area specialists are not just idea "takers" and providers of data for general theorists. Grand theory can learn a lot from them. Their work may expose weaknesses in causal relationships and draw attention to problematic assumptions. Much of grand theory stands on the foundations of what has been learned from a few classic European cases and the United States. How well do concepts derived from that historically and culturally specific context extend to regions that have had a different historic experience? At what point does concept stretching or the teleology implicit in many general theoretic models based on those few cases call into question their utility for explaining outcomes in the developing world? The relevant question is, what factors explain the range of outcomes on a given problem across the developed and developing world?—not, what key elements in the development of Europe and the United States are missing in Latin America?

The editors organized the volume into three sections. Part One tackles the classic problem of economic development.

Jeremy Adelman applies Douglas North's work on property rights to explain the well-known gap between policy intent and result. North's approach leads Adelman to fruitful research questions. How does the structure of property rights vary at different moments of the reform process, and how does this affect the rationality of the subjects of reform? Aldelman then uses his case to expose an important limitation of North's approach. It lacks a political sensibility. Creating those rights—the predicament of developing countries—is a complex political process that requires study. Paul Gootenberg's rich intellectual history of Latin Americanists influenced by Alexander Gerschenkron revives the debate over the relationship between the timing of industrialization and the tasks, opportunities, and obstacles to economic development that developing countries face. Steven Topik follows up with a fine-grained examination of the contemporary implications of Karl Polanyi's work for the problem of political order. Polanyi argued that conflict between organized society and spreading, market-driven commodification moves history. Today, market failure and the concentration of wealth drive demands for state regulation. Failure to address the issue could result in some latter-day version of fascism. Veronica Montecinos and John Markoff conclude the section with a revealing exploration of how the rise of neoclassical economists to positions of political prominence in Latin America adds institutional power to the force of their

Part Two grapples with another perennial "riddle" of Latin America: the lack of political stability after nearly two hundred years of independence from Spain. This section turns the spotlight on state formation. López-Alves uses key concepts from Charles Tilly's work on the effects of war on state building to explain different types of state formation and their institutional weaknesses in Latin America. It is an imaginative exercise in how to use theory creatively in order to think about one's cases, rather than simply applying case material as confirming or disconfirming evidence for a general theory. Alan Knight gives a tour de force performance on how to use a range of seemingly contradictory definitions of the state and the sources of state autonomy to tease out criteria for categorizing states. He shows—with excellent dry humor upon occasion—how the Mexican state has come back almost full circle to the weak agent state of the late nineteenth century. Jorge Domínguez's review of Samuel Huntington's work makes a case for more intensive study of political parties in Latin America, on the premise that they are a key institution for conflict mediation in modern democracies. J. Samuel Valenzuela uses his detailed knowledge of Chilean politics to show the limitations of Barrington Moore's classic work on the social origins of dictatorship and democracy. Valenzuela argues that the Chilean case confirms the need for research that emphasizes the autonomy of political factors from socioeconomic ones to explain democratization.

Part Three turns to culture, understood as systems of meaning. Centeno's analysis of the concept of discipline, a key component of the cultural transition to modernity that, it is often claimed, Latin America lacks, is a delight. He explores the utility of Michel Foucault's theorizing on the subject, adroitly applying evidence to demonstrate how the ambiguous specification of key variables introduces causal confusion and to highlight that Foucault's work is littered with Eurocentric assumptions that do not transfer to the Latin American institutional context. Therefore, the real research task is to explain that different institutional development path. Robert M. Levine turns the spotlight on Michel de Certeau's studies on language as an expression of resistance in everyday life by subordinate social groups. Levine suggests that the current emphasis on subaltern and resistance studies is a form of

escapism that directs research away from a more significant reality: the structures being resisted. In the concluding chapter, Claudio Lomnitz launches a thorough critique of Benedict Anderson's theory of nationalism. He proposes an alternative approach focused on bonds of hierarchical dependence, rather than on horizontal feelings of a fraternal community.

Individual chapters have their difficulties, such as inconsistent analysis, dubious use of a single case for dismissing an entire theory, occasional lapses in how the theory applies to a case, or vice versa. These and other issues, however, in no measure detract from the tremendous achievement of the book. It reaffirms that the imaginative application of evidence to theory is a creative act leading to knowledge. One might have preferred a more consistent treatment of the relationship between theory and case material across the chapters. But perhaps the variety of approaches is a greater strength. It offers concrete examples by skilled scholars of the many uses of theory. The volume rekindles fundamental debates across a wide range of problems in theory building in several academic disciplines, and it makes a convincing case for the rich variety of ways in which area studies can contribute to the enterprise.

Commissioned Ridings: Designing Canada's Electoral Districts By John C. Courtney. Montreal: McGill-Queen's University Press, 2001. 337p. \$75.00 cloth, \$27.95 paper.

Herman Bakvis, Dalhousie University

The approach to the design and revision of electoral districts in Canada is quite different from that found in the United States, despite the two countries' sharing of the same basic first-past-the-post electoral system. As John Courtney notes in his careful study of the topic, in Canada the emphasis in defining electoral districts, or constituencies or ridings, has been underpinned by concepts such as "community of interest" and "effective representation," which encompass a wide range of political and social considerations—many local in nature—and which permit substantial deviation from the principle of one person, one vote. At the federal level, the allowable deviation in the size of constituencies can be plus or minus 25% within any given province, with the possibility of even greater variances under special circumstances. At the level of provincial electoral systems, the variances can be even larger, in part due to the fact that in certain provinces the ratio of urban to rural seats is specified in law. At the same time, the actual process of designing and reconfiguring the boundaries of constituencies, in the hands of independent, arm's-length commissions for the past 40 years, has been remarkably free of direct partisan influence. In fact, given the rather tattered state of current Canadian parliamentary democracy, characterized by one-party dominance in the federal parliament and a precipitous decline in voter turnout over the past three elections, the institution of arms-length boundary commissions stands out as something that works well and enjoys broad

Since the Election Boundaries Readjustment Act of 1964, the presence of 10 arm's-length federal bodies, one for each province, as well as comparable bodies at the provincial level, stands in marked contrast to the preceding era when constituency boundary adjustments were exclusively the domain of politicians and horse trading within the regional subcommittees of parliament was the predominant means of setting boundaries. Given that in Canada changes of any kind in institutional arrangements are relatively rare, the acceptance by members of parliament (MPs) and the government of the day of a new independent body that effectively removed them from the process is quite striking.

In Commissioned Ridings, Courtney, utilizing John Kingdon's agenda-setting model, notes the confluence of three streams in the 1950s and early 1960s: the problem of huge discrepancies in constituency size becoming more evident in light of increasing urbanization; the identification of a proposed solution in the form of independent commissions, a model that was already in place in at least one province and in effect in Australia since the turn of the twentieth century; and a unique set of circumstances—a series of minority governments in the federal parliament in the 1960s, the arrival of new, young urban Liberal Party MPs, and the leaders of the three main parties being committed to change—that allowed political support for the idea to take hold. Unlike the American case, none of these critical developments were driven by court challenges. Indeed, the only significant Canadian Supreme Court decision bearing on malapportionment—Carter 1991—came long after the 1964 act. Furthermore, Carter essentially affirmed the plus-minus 25% permissible variance in the federal legislation and legitimized the concepts of community of interest and effective representation. It is interesting to note, as Courtney points out, that since Carter, the commissions have actually moved in the direction of voter equality.

The main factor facilitating the adoption of independent commissions, claims Courtney, is federalism, particularly in respect to demonstration effects when one or more jurisdictions act as a laboratory to demonstrate the impact of new policies. In this case, it was the province of Manitoba that first adopted the independent commission model in 1955, drawing directly on the Australian experience. Other provinces, most notably Quebec in the 1960s, and the federal government, took serious note of the Manitoba experiment and subsequently adopted it.

In Canada there is a small but growing community of political scientists interested in the subject of electoral apportionment. This book effectively confirms Courtney as the foremost authority within this community. Painstakingly researched, well written, comprehensive, and above all balanced, Courtney's in-depth treatment would make it difficult for anyone to contemplate tackling another book-length study to complement or displace it. All aspects of the topic are covered, including the history of apportioning seats among the provinces, the unusual circumstances surrounding Manitoba's adoption of independent commissions (following an experiment with the single transferable vote in a multimember district for the city of Winnipeg), and the ramifications of the 1991 *Carter* decision.

While few people will take serious issue with Courtney's analysis or major conclusions, some might nonetheless argue that he perhaps underestimates the partisan elements that still remain. While politicians are no longer directly involved in deciding boundaries, in various ways they still shape the membership of the commissions. At the federal level, each commission is chaired by a judge selected by the chief justice for the province. The vast majority of judicial appointments in Canada are effectively partisan appointments made by the party in power without any legislative oversight or review. Thus, in the eyes of some there is still at least the taint of partisan bias. And while, as Courtney points out, academics have increasingly come to populate the membership of commissions, some of those academics will readily admit that there was likely a partisan element in their selection. (The selection of two of the three commission members is made by the speaker of the House of Commons, who is generally from the governing party.) Furthermore, the emphasis in some of the federal commissions on voter equality and the elimination of the privilege accorded rural seats can become an implicit form of gerrymandering favoring the governing

Liberal Party, given that the strength of the Liberals tends to be in urban areas.

If there is one area where the book disappoints, it could lie in the failure to engage the debate in Canada over proportional representation (PR), a topic that in recent years has preoccupied several political scientists and a rather more limited number of politicians. Pure PR, where the country as a whole becomes a single constituency, would make the issue of boundaries and constituency size irrelevant. However, most of the PR schemes proposed for Canada tend to involve some variant of the German or New Zealand model, where multiple constituencies are still a prominent feature. Such issues as district magnitude, boundaries, and the role of and need for commissions under these variants of PR in the Canadian context could have been usefully addressed by the author.

Courtney could validly respond that such discussion would stray too far from the main subject of the book. Furthermore, one suspects that the author believes the likelihood of PR's being adopted in Canada is rather remote, and he may well be correct. Nonetheless, the past year has seen the election of at least one provincial government, in British Columbia, that has made a commitment to examine the possibility of altering the first-past-the-post system in that province. If Courtney's thesis concerning the pivotal role of Manitoba in pioneering the role of the modern boundary commission is correct, it is conceivable that British Columbia could play a similar role with respect to PR. At a minimum, some discussion of PR in relation to boundary commissions would have made for a more interesting, and provocative, book. All this notwithstanding, the book represents a significant contribution to the literature on electoral district design and redistribution and an excellent starting point for further comparative research on the topic.

South Africa's Brittle Peace: The Problem of Post-Settlement Violence By Pierre du Toit. New York: Palgrave, 2001. 222p. \$65.00.

Then I Was Black: South African Political Identities in Transition By Courtney Jung. New Haven: Yale University Press, 2000. 320p. \$35.00.

Allison Drew, University of York

These two books deal with the legacy of apartheid for South Africa's democracy, approaching the problems posed by this legacy from differing perspectives about the role of the state. Pierre du Toit, in a thoughtful and well-researched book, addresses the problem of violence in post-apartheid South Africa. Peace in a society with a history of violence needs to be nurtured, he contends, and the state must play a central role.

Du Toit traces the roots of post-apartheid violence to an evolving security dilemma. The British defeat of Afrikaners in the Anglo-Boer war of 1899–1902 was crucial to the development of this dilemma, he argues. A single statistic highlights the war's trauma for Afrikaners: In the concentration camps set up by the British for Afrikaner civilians, 7 out of every 20 Afrikaner children died from disease. This episode scarred subsequent generations, leading to the Afrikaner security dilemma. Apartheid was their response. In turn, apartheid created a security dilemma for Africans, whose identity was shaped by both material and nonmaterial deprivation. Ultimately, du Toit argues, apartheid broke down through its own contradictions, but not before spawning a culture of violence.

A mystique about armed struggle developed within the liberation movement. "Throughout the literature," du Toit writes, "the conviction is expressed (but not explained) that

the armed struggle served to inspire, motivate and spur the anti-apartheid movers more than any other form of resistance" (p. 83; italics in original). Crime came to be rationalized in terms of political struggle. Although issues about violence were at the heart of negotiations—notably debates about the suspension of armed struggle and the government's clandestine aid to the Inkatha Freedom Party—the paradox of transition was that violence and peacemaking went hand in hand. As negotiations unfolded, the "difference between conditions of war and peace became more vague, not less so, and the distinction between combatant and non-combatant more ambiguous and between enemy and ally more uncertain" (p. 78).

The democratic transition has brought a new security dilemma. Political violence decreased sharply after the 1994 democratic elections, while criminal violence has risen. As one indicator, South Africa's murder rate is 65 people per 100,000; in Canada, Sweden, and the United States it is less than 10 per 100,000. Family and community structures have lost cohesion; the police are seen as ineffective and corrupt; the inspirational motivation of the liberation struggle has dissipated. Criminal gangs have filled the social void. The culture of violence and the prevalence of arms are symptomatic of the state's inability to exercise a monopoly on the use of force and hence, du Toit believes, of the state's weakness: "A strong autonomous state able to deliver public goods both competently and equitably, and therefore to provide citizenship of equal value is a necessary yet still insufficient condition for democratic viability and for the containment of corruption" (p. 21; italics in original). Security is the basic issue around which the social contract between state and citizen is built; resolving this security dilemma is crucial to the maintenance of a stable democracy.

This resolution will entail strengthening state institutions to control violence, addressing unemployment, promoting foreign investment, and containing the international illegal trade in military equipment, which has been flooding the South African market. Just as importantly, argues du Toit, is the need to create national myths and symbols that are both neutral and inspiring. The Truth and Reconciliation Commission (TRC) played some role in this process, du Toit states, even though in his view politicians had the last word on the commission. Nonetheless, he concedes, both acceptance of responsibility for collective guilt and forgiveness are necessary, if not sufficient, conditions for reconciliation, and in this respect the TRC was successful. "There are now fewer lies, deceptions and half-truths in circulation," he writes. "For this the TRC deserves credit" (p. 163). The African Renaissance might also serve as an inspirational myth, he suggests, depending on its content. South Africa must develop a way to allow youth dignity while enabling them to earn honor.

Courtney Jung, by contrast, is critical of such an emphasis on the state for the maintenance of democracy. The call to "bring the state back in," she argues, has seen the pendulum swing too far toward state-centric approaches to democratic stability. Jung is concerned with the implication of politicized ethnicity for democratic stability. Political identity, as she defines it, is the product of elite manipulation "refracted through the memories and networks of those who are mobilized" (p. 17) and activated during struggles for resources and power.

Jung argues that ethnic identities are politicized or depoliticized through the interaction of five variables: "conditioning factors," that is, material conditions, organizational networks, and available ideology, which affect political identities more than the "proximate factors" of political institutions and mobilizing discourse. This implies, she maintains, that "an exclusive focus on the design of constitutional and electoral

systems is probably misplaced" (p. 236). Instead, negotiations about conditioning factors will be more likely to promote fluid political identities. This will minimize the persistence of rigid sectional divisions and allow the development of crosscutting cleavages necessary for a pluralist civil society. Hers is a plea for the compatibility of multiculturalism and democracy: "Difference is the norm" (p. 263).

Jung examines three cases of politicized ethnicity: those of Afrikaner, Zulu, and Coloured identities. Afrikaner nationalism was used by political elites at various points in the twentieth century to build political alliances and promote a state-led development that facilitated the rise of an Afrikaner capitalist class. But from the 1960s, state discourse referred increasingly to white rather than Afrikaner identity. By the 1990s, Jung points out, political mobilization on the basis of Afrikaner ethnicity represented a very minor and far-right tendency.

The discussion of Zulu ethnicity and its political uses is the strongest and most interesting. If Mangosuthu Buthelezi used ethnicity, combined with intimidation, to build the Inkatha Freedom Party during the apartheid era, his approach has changed in response to post-apartheid conditions. During the 1980s, the United Democratic Front (UDF), aligned with the exiled African National Congress (ANC), played down sectional and class identities in favor of a broad anti-apartheid front. That approach has been replaced by the ANC's celebration of Zulu identity and its desire to include it within a broader African national identity. The ANC has gained the allegiance of the Zulu king, and although Inkatha has relied on chiefs for its rural base, the ANC is now undermining that relationship through the use of the government purse. Buthelezi, in turn, is seeking to broaden Inkatha's traditional Zulu support.

Jung's discussion of Coloured politics in the 1980s focuses on the UDF and the Labour Party, which participated in the racially exclusive Tricameral Parliament. But those two organizations did not represent the entire Coloured political spectrum in the 1980s; the Western Cape UDF was also involved in and influenced by heated debates with leftists outside the ANC and its allies. Seemingly taking informants' views at face value, Jung takes a rosy view of the ANC's current politics vis-à-vis Coloureds. It is debatable whether the ANC has dealt adequately with the alienation of those formerly classified as Coloured, who still feel themselves trapped between whites and an African majority. Surely, any test of the ANC's ethnic neutrality would be found in its policies: whether development assistance is allocated on the basis of ethnicity or geographic locality or on the basis of income and class, for example. Jung's discussion of organizational policies could be stronger at points. The characterizations of the Pan Africanist Congress, the Unity Movement, and the Black Consciousness Movement are at times questionable and would benefit from a more nuanced approach (pp. 269, 283).

The possibility of using electoral rules to represent and control ethnic groups was, of course, rejected during the negotiations process. The new constitution enshrines universal franchise and democratic rights. That ethnic identity should be fluid in post-apartheid South Africa comes as no surprise. The previous regime used repressive social engineering to divide South Africans into four main sectional groups and then to subdivide Africans further on the basis of supposed tribal identities. In democratic South Africa, people are free to identify themselves, culturally and politically, in terms that they choose, which may or may not include ethnic identities. The post-apartheid state, concerned with promoting both national and African unity, has employed the motifs of the Rainbow Nation and the African Renaissance to symbolize its national vision. Jung highlights the importance of eth-

nic fluidity in post-apartheid South Africa, while pointing to the significance of class and of rural-urban divisions. Gender identity, of growing political salience in post-apartheid South Africa, merits further research. South Africa remains an extremely class-divided society; the poorest are disproportionately black, rural, and female.

That ethnically based electoral engineering was a nonstarter does not, as Jung's argument implies, negate the need for a state role in other domains. South Africa must undoubtedly walk a fine line—avoiding the one-party state that may grow from a dominant party system, while addressing the pressing social needs faced by the country's majority. In a continent plagued by collapsed states and social anarchy, there is scope and need for South Africa to play a critical role in the continent's development. But this regional role does not negate the state's responsibility to its own population, as du Toit emphasizes. The most important checks on a state's arbitrary abuse of political power are the people and popular organizations and a willingness to hold political leadership accountable. To take one example, the publication of the TRC's report, in spite of partisan attempts to censor it and its critical evaluation of human rights violations across the political spectrum, indicates the commission's political autonomy from partisan influence. The TRC's report underlined, for the future, that post-apartheid governments will be held accountable for their own actions. Whatever the debates about the role of the state, it is the state's accountability to its people that is the greatest guarantor of democracy.

Support for Economic and Political Change in the China Countryside: An Empirical Study of Cadres and Villagers in Four Counties, 1990 and 1996 By Samuel J. Eldersveld and Mingming Shen. Lanham, MD: Lexington Books, 2001. 146p. \$70.00.

Alan P. L. Liu, University of California at Santa Barbara

Being one of a handful of opinion surveys conducted in China, this book should be of interest not only to China specialists but also to students of public opinion, political culture, and survey research. In 1990 and 1996, a joint team of American (University of Michigan) and Chinese (National Beijing University) scholars conducted surveys of the opinions of Chinese peasants and rural cadres in four Chinese counties in north and south China (in the provinces of Hebei, Hunan, Anhui, and the special municipality of Tianjin) concerning economic and political reforms in the post-Mao years. This book represents a partial analysis of the surveys.

Samuel Eldersveld and Mingming Shen conclude that "much democratization has, and is, taking place" (p. 134) in contemporary China. Although political liberalization at the mass level in China might be "only a small reality" (p. 134), it "is touching the lives of Chinese masses each day, socializing them to greater support for democracy" (p. 134). The evidence for such claims came entirely from Chinese respondents' answers to questions on their support for economic and political reforms, their beliefs on political participation, and their tolerance of political competitions and conflicts.

In economics, Eldersveld, Shen, and their colleagues asked peasants and cadres to evaluate the degree of success of the reforms and the benefits that they had received from them. They found that a large majority of cadres and masses in the four counties had accepted economic reforms, had benefited from them, and were ideologically disposed to less governmental control. They asked similar questions about political reforms, especially on direct election of county People's Congresses (China's nominal legislatures), election to village committees, separation between party and state, and

the extent of cadre corruption. A sharp difference appeared in the masses' responses to economic and political questions. A high rate of peasants, up to 50% of the respondents in both 1990 and 1996, refused to answer political questions. However, of those who responded, a clear majority supported the political reforms. Two major findings from the surveys are, first, the cadres' influence on attitudes of the masses (in a positive direction) and, second, a positive correlation between political activism and the extent of poverty in an area.

Interesting as these results are, the study by Eldersveld and Shen has a number of problems. First of all, the authors did not explain the criteria for selecting these four particular counties, out of 1,936 counties in China. But they noted considerable variances in people's attitudes in different localities. The lack of clarification in the standard for choosing the four counties makes one doubt their generalizations about democratization in China.

Second, the two authors had done a very limited background research into the history and social conditions of modern China. They neglected entirely the surveys and analyses of the countryside by Chinese scholars, relying instead on a few secondary English works. They mistook Chinese peasants' recovery of their precommunist way of farming for what they termed "amazing conversion" (p. 19; emphasis mine) to the so-called new system. They seemed to be unaware of the fact that post-Mao reforms in the countryside affected the political power structure very little. The rural power figures, such as (in descending order of authority) party branch secretary, secretary of the youth league, head of the local militia, and director of the women's association, remained intact and, in many villages, were still the same persons from Mao's era. These village elites controlled local elections. Chinese writers on local politics have presented a very different picture (for example, He Xuefeng, "System of Village Organization: Distances and Causes Between Ideal and Reality," Shehuixue 6 [1998]: 59-64; and Cao Yongxin, "Analysis of Some Problems in Rural Order and Village Political Development," Shehuixue 4 [1999]: 102-6). Eldersveld and Shen's descriptions of local politics as being competitive are thus extremely misleading (see pages 4 and 40). There were other errors of the same nature, such as portraying Mao as having played a significant role in promoting democracy within and outside of the Communist Party (see pages 11, 78, 93, and 131).

The third problem is that Eldersveld and Shen's discussion of political participation in rural China is out of context. According to the letters of the national government, village self-rule encompasses four democracies—election, decision making, management, and supervision. This book deals only with election. Academic and press reports from China tell us that villages that have lived up to the formal standard of self-rule are more exceptions than the rule. Furthermore, information from China indicates that an increasing number of peasants are resorting to the so-called collective shangfang gaozhuang (visiting higher authorities and lodging complaints against local leaders) to air their discontent. Even riots have occurred in rising numbers. That peasants are resorting to extrasystem ways of expressing their views testifies to the ineffectiveness of the formal system of political participation.

Last but not least, Eldersveld and Shen's study lacks a theoretical foundation. They have said nothing about the mechanism that might connect village self-rule to democratization at the national level. They write without elaboration that "if political change is to be implemented, including democratization, what happens at the local level is critical" (p. 116). If they had carefully studied Taiwan's transition from local election to national democratization, they might have had a reference country to help their analysis of Mainland China.

Unfortunately, their one reference to Taiwan (p. 68) exposes the two scholars' lack of the most basic knowledge of Taiwan's experience in democratization.

**Multinational Democracies** Edited by Alain G. Gagnon and James Tully. Cambridge: Cambridge University Press, 2001. 428p. \$70.00 cloth, \$25.00 paper.

Garth Stevenson, Brock University

As the distinguished Canadian philosopher Charles Taylor notes in his foreword to this book, liberal democratic political systems are becoming more diverse in terms of the cultural identities of their citizens, yet their legitimacy, unlike that of autocratic states or empires, depends on maintaining a certain level of unity and homogeneity. Without it, neither democratic participation, nor a regime of equal rights, nor even satisfactory economic performance appears to be possible. The effort to create a semblance of coherence and common purpose while recognizing and accepting unavoidable diversity, a theme that has dominated Canadian political discourse and practice for a century and a half, has become a preoccupation for much of the world. Yet there are more questions than answers. Consociationalism, a fashionable concept a generation ago, no longer has many supporters among social scientists. Federalism, originally invented in the United States for quite a different purpose, can accommodate conflicting nationalisms only if a precise geographical boundary can be drawn between them—and not always then.

This multiauthored, and multinational, book provides a number of insights into this problem. The concept around which the volume is organized, as suggested by its commendably brief title, is that of multinational democracy: defined as a democratic state containing more than one sociological nation. The four examples considered in the book are Canada, Belgium, Spain, and the United Kingdom, although the authors give the United Kingdom less attention than the other three. All are affluent, predominantly white, and reasonably stable North Atlantic democracies (although Spain's experience with democracy is relatively brief), a fact that suggests the implicit criteria for their inclusion in the volume.

"Multinational" should perhaps not be taken too literally: Belgium comprises only two national communities, although Brussels, where the two are mingled, constitutes a third component of Belgium's territorial federalism. In Canada, although it has recently become politically correct to refer to the aboriginal tribes as "First Nations," Quebec is the only minority nation with a fully developed civil society and a serious capability to form its own state, and the only one that controls a provincial government within the federal state. Spain and the United Kingdom, which are often, although erroneously, viewed as prototypical, and until recently highly centralized, "nation-states," are both more deserving of the multinational label.

The 19 authors of the book, about evenly divided between Canadians and non-Canadians, include both political philosophers and comparativists. (There are no women among the contributors, a rather conspicuous lack of inclusiveness in a book largely devoted to identity politics.) The book contains a lengthy general introduction by coeditor James Tully, followed by 16 chapters grouped into three parts. In the brief and anonymous introductions that lead off each of the three parts, we are told that the first part deals with interrelations between justice and stability in theory and practice, the second part with the tensions between normative claims about recognition and forms of accommodation, and the third part with the normative and institutional dimensions of modes of reconciliation and conflict management (pp. 35, 133, 275). In

practice, as these introductions may suggest, there is no clear delineation of purpose between the three parts, and the rationale for dividing the book into sections is not immediately obvious.

In his general introduction, Tully suggests that comparativists have usually approached the study of culturally divided societies with an emphasis on the search for accommodation and stability, while political philosophers have emphasized the themes of justice and recognition. As a political philosopher, Tully emphasizes the traditional preoccupations of his field, justice and recognition, but cautions that "the constitutive question is no longer the one that has defined these struggles since Kant and Hegel: what is the just and stable form of recognition that will end the struggle?" (p. 5). Instead, the quest for recognition should be viewed as an ongoing dialogue with no final resolution. The emphasis thus shifts from the "solution" that will "finally" resolve the question to the procedural rules that govern the dialogue, and to the freedom to adjust the relationships between national communities to reflect changing needs and aspirations. Almost half of Tully's introduction is devoted to an analysis of the Supreme Court of Canada's decision in Reference re the secession of Ouebec (1998) 2 S.C.R. 217, a decision that appears to be based on this assumption.

Several chapters refer, either explicitly or otherwise, to the familiar but somewhat misleading distinction between "civic" and "ethnic" nationalism. In Chapter 2, comparing the politics of bilingualism in Brussels, Montreal, and Barcelona, Dominique Arel suggests that the distinction is largely meaningless. No state can really be neutral or indifferent to questions of language or culture, and a civic nation-state is merely one whose minorities—usually immigrants who have voluntarily chosen to reside within the state—accept the inevitability of assimilation to the dominant language and culture. On the other hand, ethnic nationalism is not necessarily illiberal and may tolerate minority cultures in practice while being dedicated to the protection of one culture in theory. He obviously has Canadian and Québecois nationalism in mind when he writes: "Like in a game of shifting mirrors, the civic nation to some becomes the ethnic nation in the eyes of the other" (p. 76). In Chapter 12, entitled "Nationality in Divided Societies" but largely focusing on the case of Scotland, David Miller reaches much the same conclusion (p. 306). He also makes the important point that people may have a dual identity: Scottish/British or Québecois/Canadian.

In Chapter 8, Shane O'Neill draws somewhat different conclusions from his examination of Northern Ireland, where religion more than language tends to differentiate the two national communities within the state, and where the identities appear to be mutually exclusive. Although admitting that the Good Friday Agreement falls short of his ideal, since it continues to privilege the Unionist (British) majority, O'Neill believes that a truly neutral and inclusive political culture is possible in a divided society, provided that both sides agree to regard the question of which constitutes the numerical majority as irrelevant. (The present assumption that a majority should be allowed to decide whether Northern Ireland is affiliated with the Irish state or with the British state is inappropriate, in his opinion.) Even this qualified optimism seems to be at odds with the conclusions of Arel's chapter, not to mention the pessimistic but convincing comparative analysis of Canada and Belgium by Dimitrios Karmis and Alain G. Gagnon in Chapter 5.

In conclusion, this book is a welcome sign that the dialogue between Canadian and Québecois nationalists is maturing and becoming less parochial and more thoughtful—on both sides. It should be read not only by Canadians of both persuasions but by anyone interested in the politics of nationalism.

Politicians and Poachers: The Political Economy of Wildlife Policy in Africa By Clark C. Gibson. Cambridge: Cambridge University Press, 1999. 262p. \$70.00 cloth, \$26.95 paper.

Goran Hyden, University of Florida

This interesting and insightful book on the political economy of wildlife policy in Africa is an important contribution to the literature not only on African politics but also on the role that institutions play in shaping behavior and decisions. Although wildlife may not occupy the same centrality in African economies as oil and precious metals do, it is a crucial natural resource that earns countries, especially in eastern and southern Africa, significant revenue. Few political scientists have paid attention to this sector. No one has really approached it from a political economy perspective. Yet the struggle over access to natural resources in Africa is very much a political matter. Gibson's well-crafted and thorough study fills this gap. Its main contribution to the discipline at large is its focus on the distributive nature of institutions. The latter do not just produce collective or public goods. They also serve individual interests differentially. By concentrating on the strategic interaction of individuals within institutions, Gibson, following in the tradition of Douglass North and Robert Bates, identifies the intended and unintended consequences of policy decisions made with regard to the use and conservation of wildlife in Africa.

The empirical focus of this study is Zambia's wildlife sector after independence. It traces the politics of wildlife beginning with the decision in the early years of independence by then-President Kaunda to continue, in spite of popular resistance, pursuing the conservationist approach adopted by the preceding colonial administration. The bulk of the analysis, however, centers on subsequent years when the principal issue was how to reduce poaching and ensure that ordinary citizens might be able to share the revenue from hunting and tourism. Much space is rightly devoted to the "community-based" approach to wildlife conservation that evolved in the 1980s following the reported success of the CAMPFIRE project (Communal Areas Management Programme for Indigenous Resources) in neighboring Zimbabwe. The experiences of wildlife policy there as well as in Kenya provide useful, though not fully analyzed, comparisons with the empirically rich account of what took place in Zambia.

Anyone familiar with the issues of environmental conservation in Africa will feel at home in Gibson's account and analysis. I find three themes particularly well covered. The first is the "parks vs. people" topic, that is, the issue of how to combine wildlife conservation with cattle grazing and other such activities that may compete for the use of increasingly scarce land. The second is the tension between the conservationist lobby-largely international in composition-and nationally elected representatives wishing to respond to the opinions of their local constituents that wild game is either a nuisance or a resource to which they should have unrestrained access. The third is the difficulty of finding an institutional formula that caters to the complex and contentious nature of wildlife conservation in Africa. The author has consulted a very wide range of primary and secondary sources on the subject, and although his coverage of Kenya and Zimbabwe is less satisfactory, he demonstrates his command of the subject

My praise of the book notwithstanding, the author falls short of a critical reader's expectation with regard to at least two issues. The first is the extent to which his own case study is typical of policymaking in Africa. Gibson does not address this issue. For example, he rather uncritically uses his finding that the Zambian legislature threw out a government policy

initiative in this sector as proof that parliaments in Africa are more powerful than the mainstream literature assumes. The fact that this single rejection occurred in the context of what may have amounted to thousands of discretionary policy initiatives by the president and his government ministers is completely overlooked. One would have expected a more careful use of the evidence than such a generalizing statement.

The second relates to his conception of private interest. Gibson is obviously right in suggesting that much strategizing in public institutions is private. In African countries, patronage rather than policy reigns. Public policy, therefore, is falling short of expectations less because of inadequate executive capacity than due to a lack of commitment to the notion of a "civic" public realm. Gibson's own explanation of this phenomenon, however, tends to suffer from an overly simplified notion of what "private" or utilitarian interest really means in the African context. He operates with a crude distinction between a utilitarian and "moral" notion of political economy, which makes him overlook the fact that the African political economy really falls in between the two. It is neither wholly utilitarian, nor fully communitarian (or moral). Choice and behavior are socially embedded but not institutionalized in a formal or more permanent sense. The political process in Zambia and elsewhere in Africa really responds to and moves forward because of the investments people make in strategic relations with other key actors, whether they are superiors, allies, or supporters. "Causes" or issues do not drive these relations; they are only instrumental in fomenting such relations. Institutions that matter, therefore, are not formal but informal. They are inevitably ephemeral. The challenge that political leaders face in such contexts is how to stabilize these transient relationships. Sometimes this can be convincingly achieved by accepting defeat, especially if it is, as in the case of the president's defeat over the wildlife policy, on an issue where a majority of potential allies and supporters are on the other side. The issue, after all, is only a means, not an end, to success. By sticking to an overly bare notion of what selfinterest means in the African context, Gibson only touches on, but fails to explore, this key aspect of how relations rather than policy drive the political process in oft-unexpected directions.

No Other Way Out: States and Revolutionary Movements, 1945–1991 By Jeff Goodwin. Cambridge: Cambridge University Press, 2001. 428p. \$60.00 cloth, \$23.00 paper.

Eric Selbin, Southwestern University

"Do we need yet another comparative study of revolutions?" (p. 5; emphasis in original), Jeff Goodwin asks in this eagerly (and long) anticipated and important new book, which is destined to influence scholars in several disciplines and fields. The answer, as this volume makes abundantly clear, is "yes," and few will be disappointed with this well-written, accessible, and compelling volume, the most nuanced and sophisticated argument yet for the state-centered (but, pace Goodwin, not structuralist; see p. 53) approach, and worthy heir to Theda Skocpol's (1979) still paradigmatic States and Social Revolutions. But therein lies the rub: Rather than the first book of the (putative) emergent fourth generation of scholars of revolution(s), this is likely the last of the third generation. Goodwin concedes he has "largely moved beyond" (p. xvi) the perspective he articulates here, and he, along with John Foran, is one of the most likely suspects to produce the next paradigmatic statement on revolutions. This, then, would seem the third generation's crowning glory; given the long gestation period and the prolific Goodwin's many and impressive contributions to matters revolutionary, this is almost more a legend than a book.

With the state firmly ensconced at the center (pp. 24–31) and implement—"the absolutely critical importance of political context" (p. 17)—in hand, Goodwin takes, primarily via secondary sources (p. xvi), a wide-ranging, erudite swing through a dozen-plus countries and many more movements. Adopting a broader ("political revolution") as opposed to more narrow ("social revolution") definition of revolution (p. 9), he sets out to sample revolutions and revolutionary movements that occurred only during the Cold War and only in "so-called peripheral or dependent societies of one type or another" (pp. 5-6); of greater note, he considers not just the successes but the failures as well (pp. 6-8). All of this is in pursuit of why revolutions and revolutionary movements emerge in some places and not others and succeed some of the time but not all of the time. The premise is that "general (if not universal) causal mechanisms" can be identified, catalogued, and compared (p. 8).

While the book is broken up into four parts (nine chapters), most people will read it as comprising two halves, one more theoretical, the other more substantive; a pithy annotated bibliography will quickly become a staple for graduate students in several disciplines. The more theoretically inclined will be particularly taken with chapters that consider the strengths and limitations of the state-centered perspective (Chapter 2), the introduction of "persistent insurgencies" as a nuanced third category to better theorize those processes caught between success and failure (Chapter 7), and a concluding chapter wherein Goodwin proffers "generalizations and prognostications."

The theoretical chapters are rich and provocative. Goodwin's artful discussion of the state-centric perspective, misleadingly labeled an "appetizer" (p. 31), is a powerful and clear paean to the statist tradition—long on strengths and short (and a bit dismissive; see, e.g., p. 55) on limitations. Goodwin presents a persuasive case for four distinct types of state-centered analysis: "the state-autonomy, state-capacity, political opportunity, and 'state constructionist' approaches" (pp. 37-40). In search of a "powerfully parsimonious" as opposed to "exhaustive" explanation (p. 58), Goodwin deftly demonstrates such a perspective as being suited to solving the puzzles that bedevil students of revolution to an extent that will convince most. Despite a caveat (to his credit, such are repeated early and often throughout the book) in the introduction that "states are not the only thing that matters" (p. 30; emphasis in original), this chapter and the rest of the book make clear Goodwin's commitment to the state as the key/critical (f) actor in the revolutionary process across its various stages; to borrow a line, the state isn't the only thing, it's everything—at least until "the sort of synthetic perspective on revolutions and collective action that we clearly need" (p. 63) comes along.

The other "half" of the book provides several brief nicely drawn case studies: chapters on Southeast Asia and what proved to be the only domino, Vietnam, set in a comparative perspective; chapters on Central America and the "anomalous" case of Honduras; and a chapter on Eastern Europe and its "refolutions." With regard to these more substantive chapters, I will defer to area studies specialists who will no doubt (and rightly) note problems; on the basis of the area with which I am most familiar, his accounts are perceptive and satisfactory. Some of these complaints may be more than mere quibbles or differences in emphases or interpretation; in any case, they will miss the point of the exercise. Despite some discomfort with such, presumably the social science project is to subject puzzling moments/processes of social disorder to the (calming) order of "scientific" analysis, and this is an attempt

to do a genuinely comparative project without resorting to either mindless number crunching or suspect rational choice analyses; neither have produced satisfactory answers with regard to resistance, rebellion, and revolution. Despite the reliance on secondary sources, the cases are treated seriously and rigorously. The absence of two of the most significant of the Cold War revolutions, China and Cuba (except for the latter's effective cameo in Chapter 2), seems odd.

The parsimony sought, Goodwin concludes, is ultimately not attained in the face of "the sheer implausibility of a general theory of revolutions or peripheral revolutions" (p. 290). The fault for this, it would seem, lies with an array of actors and factors that have relatively little to do with the state. But, he contends, few will be able to better the solutions to the puzzles that confront us, since across the myriad cases he finds that "revolutionary movements developed and sometimes thrived in opposition to" (p. 290) authoritarian albeit weak/ened states, even when they held elections, and succeeded most often when those states were particularly alienated from "civil society" and hierarchically structured. As presaged by his early invocation of Marx's dictum to the effect that people make their own history but not under the conditions of their own choosing (p. 25), and reflecting an impressive panoply of cases and a genuine effort to be sensitive to the conditions extant, Goodwin's bottom line is that "[c]ertain types of states and regimes unintentionally helped to construct revolutionary movements or, more precisely, the type of political contexts in which revolutionaries were able to thrive" (p. 292; another caveat echoes Marx: sometimes revolutionary movements "create, and [do] not simply exploit" opportunities).

For at least some, Goodwin's most controversial conclusion will be that revolutions will be less likely in the decades to come (p. 300). In short, globalization, the collapse of the Soviet model, and the emergence of formal democracies have dramatically reduced the space for and likelihood of revolutions. While as careful here as he is throughout, a quick refutation might simply be that globalization has created new economic problems and new sources of support, the collapse of the Cold War may create more rather than less space for revolutionaries (i.e., less excuses for intervention), and the institutionalization (often fragile) of democracy is proving to be a far cry from the consolidation of democracy, the democratization of people's everyday lives.

Goodwin has offered the most sensitive state- or institution-centered instrument yet for the study of revolutionary processes. And yet people remain at least distant and at times absent, and it is largely they and their actions whom and that we seek to explain. While recognizing that the inherent complexity of people may be problematic (even inelegant) in the salutary search for the most parsimonious explanation, ideology and culture provide entrees. People join revolutionary processes for many reasons, some of which, as Goodwin suggests, have to do with the state; but not all. Revolutionary struggles are about far more than struggles for or against state power, reflecting people's efforts to fundamentally transform the material and ideological conditions of their everyday lives (and those of others) now and for all time. However charily chosen, revolution is part of the tool kit for many people in many parts of the world, and it is the conscious efforts—not to deny the obvious profusion of concomitant unintended consequences—by at least an active minority of the participants to profoundly transform themselves and their entire society that defines the processes most of us construe as revolutions. That this happens largely within the constructs we have called states (more or less) since the seventeenth century may be in part a historical accident.

Revolution remains on the historical agenda both because "[r]evolutionary movements are not simply or exclusively a response to economic exploitation or inequality, but also and more directly a response to political oppression and violence, typically brutal and indiscriminate" (p. 3) and because there are people enmeshed in the struggle for profound change. While Trotsky posited revolution as the option only "when there is no other way out" (p. 26), a close colleague posed the question, "what is to be done." The puzzle posed by this marvelous book is, in part, why we should continue to center the state when, as Goodwin ably (and amply) demonstrates repeatedly, there are so many other factors that merit our consideration; there is another way to read Marx's dictum and its recognition that people make their own history. Ultimately, if we wish to understand and explicate why revolutions happen here and not there, now and not then, among these people and not those, we will have to investigate the lives of those people—their ideologies, their cultures, their communities, their symbols, and their commitments.

Here, I fear that I have committed the book reviewer's worst sin, taking the author to task for not writing the book the reviewer would have written if only s/he had been talented or clever enough to do so in the first place; mea cupla. This delightful and engaging book, crammed chock-full of thought-provoking and challenging ideas, is one of the finest books on revolution written to date and merits the wide consideration and regard it will receive.

Varieties of Capitalism: The Institutional Foundations of Comparative Advantage Edited by Peter A. Hall and David Soskice. Oxford: Oxford University Press, 2001. 560p. \$72.00 cloth, \$24.95 paper.

David Coates, Wake Forest University

The volume and quality of the scholarship generated of late on the question of the "varieties of capitalism" has been truly outstanding. We now know far more than we ever did about the internal workings of particular national economies, and about the determinants of what Angus Maddison once termed the "proximate" causes of their competitive strengths and weaknesses. That knowledge has come in part from the work of a talented set of comparative political scientists and industrial sociologists, many of whom participate in this collection. It has also come from the work of a set of economists and economic historians with sufficient professional courage and intellectual integrity to operate at (or even beyond) the edge of their notoriously narrow and institutionally blind discipline. But because that knowledge has come from so many sources, and because so much of it has entered the public domain in the form of discrete case studies or collections of relatively disconnected essays, what the subfield now needs, more than anything else, is the consolidation of a set of organizing frameworks and governing concepts designed to go beyond proximate causes to a fuller understanding of the dynamics of competitive advantage. This is why Peter Hall and David Soskice's much-heralded collection of essays, Varieties of Capitalism, is so important a milestone in the development of the subdiscipline of comparative political economy. At long last it gives us what Pepper D. Culpepper calls here an "analytical tool kit" (p. 303): a collection of essays built around the powerful conceptual devices of "comparative institutional advantage" and "institutional complementarities"—concepts deployed to explain "how the institutions structuring the political economy confer comparative advantages on a nation, especially in the sphere of innovation" (p. v)

Building on the already powerful conceptual distinction between "liberal market economies" and "coordinated market

economies" developed by David Soskice and others in the 1990s, the opening essay of this collection seems destined to be widely cited. In it, Hall and Soskice develop a firmcentered political economy based on a relational view of the firm: one in which firms develop their core competencies and dynamic capabilities by coordinating effectively in five spheres (those of industrial relations, vocational training and education, corporate governance, interfirm relations, and intrafirm relations with their own employees). Such coordination happens one way in liberal market economies, in another way in coordinated market economies, in each case giving firms comparative institutional advantage to the degree that they exploit the institutional complementarities of the national system in which they find themselves embedded. The case study chapters that follow then demonstrate and reinforce the Hall and Soskice argument "that the institutional structure of a particular economy provides firms with advantages for engaging in specific types of activities there" (p. 37). In a collection of consistently high-quality pieces, there are particularly valuable comparative chapters on industrial relations, training systems, and corporate governance.

The very power of the argument developed here by Hall and Soskice, and the widely respected work already published elsewhere by many of the contributors to this volume, are likely to establish this book, and its governing concepts, as the dominant ones for the next generation of graduate students in the field. Yet insightful as the approach developed here is, there may be dangers lurking in such a dominance, for the notion of comparative institutional advantage as the key to competitiveness carries implications that are not widely signaled in this collection, even though the whole approach is introduced in an attractively tentative and open-ended manner. Two in particular stand out. One is that analysis should stop—that our explanation is complete—once the dynamics of institutional advantage are mapped, and the logics released by institutional interaction are charted. The other-queried in the volume only by Kathleen Thelen (p. 73) and Pepper Culpepper (p. 275)—is that particular bundles of institutional linkage, once established, largely predetermine the policy options available to economic actors (not least, labor movements) caught up within them.

The explanation of varieties of capitalism developed in the Hall and Soskice chapter does not go the extra inch to explore and explain why, when, and how particular sets of institutions come into existence. Nor does it go the extra mile to examine how those institutions relate to the wider set of class experiences and interests that seem (to some of us, at least) to be endemic to capitalism in all its national manifestations. Instead it gives us what can easily be read as a new kind of institutional determinism. Hall and Soskice establish the dynamism of coordinated market economies (and by implication, the long-term viability of welfare systems in their continental European form) by also conceding the viability of liberal market capitalism (and its incompatibility with labor rights and welfare provision of a commensurate kind). That runs the risk of inadvertently giving retrospective legitimation to the antilabor, antiwelfare arguments of Reagan and Thatcher, and of offering only the bleakest prospects for welfare provision in economies that have the misfortune already to be set onto a liberal-market path. I am sure that this political closure was entirely unintended by the editors, but it seems an ever-present danger of the analytical framework they have developed so well. And if it is, it follows that if we are properly to research the forces shaping institutional advantage, and if we are adequately to map the politics of changing those institutions, we now need to go beyond the conceptual universe and level of explanation developed in this fine collection.

There is no doubt that *Varieties of Capitalism* will prove to be a landmark text. It is a very important collection, of value to all students in the field. The issue before us is whether to treat its publication as an ending, or simply as a beginning. Let us hope, two decades from now, that the latter is its status.

Social Democracy and Welfare Capitalism: A Century of Income Security Politics By Alexander Hicks. Ithaca, NY: Cornell University Press, 1999. 256p. \$45.00 cloth, \$18.95 paper.

Norman Furniss, Indiana University

Alexander Hicks has written one of the most important works in the past thirty years on the development of income security policies in democratic capitalist states. (Hicks equates income security policies with "welfare states"—a point I will revisit later.) If this were not sufficient, the book also is the most significant comparative public policy study I have read. Based on years of reflection, scholarship and teaching, it covers, not merely cites, a wide range of literatures. It is extremely sensitive to particular historical experiences. It is theoretically informed. Most impressively, it is methodologically sophisticated and imaginative. And the book is concise and well—written. In short, it is a model of what exciting comparative research can be.

A brief review cannot capture the subtlety of the analysis, but broadly Hicks advances a "class centered, if state mediated, theory of the welfare state" (p. 15), in which "sustained working class steering integrates the journey" (p. 12). The argument proceeds historically, beginning with social security program consolidation after World War I. This is the most impressive chapter in the book. Hicks uses "Qualitative Comparative Analysis," a form of Boolean logical comparison developed by Charles Ragin (with contributions from Hicks himself [The Comparative Method, 1987]), to distinguish three distinct routes to early welfare state formation.

Next, Hicks examines the consolidations through the 1950s, showing "social democracy's predominance in the 1930s and 1940s social reform" (p. 109), and the significance of the strength of the labor movement throughout the 1950s. Once again, this account is methodologically imaginative and is grounded in an enviable command of the historical evidence. Finally, the chapters raise and develop a number of intriguing issues, ranging from the impact of Catholic social thought and Christian Democratic Parties to an assessment of Gosta Esping-Andersen's "worlds of welfare capitalism" (The Three Worlds of Welfare Capitalism, 1990).

Hicks then turns neocorporatism as a "bridge" to the present pattern of social policies and politics, emphasizing the direct continued relevance of social democratic government to the "preservation of neocorporatist institutions and the welfare state regime" (p. 221). His concern shifts from funded program adoption (which states by now have or have not instituted—interestingly, there are few examples of states engaging in "late" adoption of, say, family allowances) to "welfare effort," defined as the level of public spending. The range of policies considered is expanded to include public health care effort. The final empirical chapter considers two reasons for the welfare state "crisis," demographic change and globalization, finding that in each case there is somewhat less than meets the eye. The discussion of globalization is particularly trenchant. Hicks concludes by raising the issue of "possible futures of the welfare state" (p. 230), with specific reference to social movement theory. Although he has a number of insightful things to say about the theory, it must be noted that this focus seems too narrow to tease out the full dynamics involved in discussions of possible futures.

Some expansion of Hicks's theoretical perspective and "dependent variable" (public spending) would be useful for this discussion. First, the "welfare state" need not be seen conceptually as the same institution as the social security state. This is especially the case if we add a consideration of policies like health care (Chapter 7) or include education. For example, over the past twenty years France (mainly through the policies of Socialist governments) has experienced a remarkable increase in access to all levels of the educational system, including higher education. (Of course, many European countries have seen this "massification" as well, but the French case is particularly striking.) All this bears directly on our understanding of what we might mean by the "welfare state" and its putative retrenchment. Second, and related, it could be valuable to examine the content, not merely the level, of welfare provision. Hicks's admonitions about the dangers of "overinterpretation" of the Beveridge Plan to the contrary, an explanation of why Britain moved from welfare pioneer to laggard (p. 125) seems incomplete without including the content of the Plan. The institutionalization of the flat rate benefit/flat rate contribution scheme constrained further reforms, and its presence mobilized political forces (including the Labour Party for its defense), locking them into the status quo for years. Present reforms and debates that advance quasi-private, or "tax expenditure," supplements or alternatives to publicly funded income security policies bring the need to include content into sharper focus. On policies such as health care, a concern only with publicly funded provisions is clearly insufficient.

Third, returning to "working class steering," it is unclear how much longer this concept will be fruitful in light both of the decline in party identification and of the debates within left parties themselves about what their visions should be. This debate is occurring within Christian Democratic Parties, with the idea of Catholic social action in at least temporary retreat. Finally, on the term "state," the book makes no mention of the European Union to which a majority of the countries under review belong. This is not a particular difficulty when our interest is primarily one of accounting for historical developments. But when we turn to the present and possible futures, the EU will have to be considered.

In sum, this is a deeply thoughtful book that not only clarifies and expands our understanding of the development of income security programs but also helps structure further research programs.

Brazilian Party Politics and the Coup of 1964 By Ollie Andrew Johnson III. Gainesville: University Press of Florida, 2001. 176p. \$55.00 cloth.

Deborah L. Norden, Whittier College

In 1964, Brazil embarked on one of Latin America's longest experiments in modern military authoritarianism. Ollie Johnson's *Brazilian Party Politics* seeks to understand one of the important antecedents to the coup by looking at the political party system during the 1945–64 period. While the book does not succeed in demonstrating a strong causal connection between party politics and the coup, it does provide a very interesting new perspective on party politics and realignment, looking beyond the more immediate electoral indicators of the Brazilian party system.

According to Johnson, Brazilian party politics during the pre-coup period "is fundamentally the story of the rise of leftist and nationalist party forces committed to changing the political and socioeconomic system and the reaction of more

conservative party forces against such change" (p. 14). The book effectively demonstrates this shift to the left in Brazilian politics by looking beyond merely electoral results to a consideration of intraparty factions and transparty alliances. By doing this, Johnson manages to build a much clearer picture of trends in Brazilian politics than the often amorphous, or "cloudy" (p. 35), image that emerges from considering only electoral support for the political parties.

As described, the three principal parties of the period, the PSD (Social Democratic Party, a centrist party), the PTB (Brazilian Labor Party, a party of the left), and the UDN (National Democratic Union, a conservative party), composed only the surface of organized political representation in Brazil. According to Johnson, by the early 1960s, each of these parties had developed progressive factions with similar agendas (p. 53). In the PTB, this faction succeeded in shifting the party to the left, while reactions against these factions encouraged the other two parties to shift further to the right. At the same time, two important "transparty" alliances formed, the FPN (National Parliamentary Front) and the ADP (Democratic Parliamentary Action), on the left and right, respectively (p. 89). Johnson writes that, "[w]hile the ADP was composed largely of UDN and PSD members, the FPN drew primarily from the PTB" (p. 101); however, both alliances included substantial numbers of individuals from all three major political parties, as well as from several of the smaller parties (pp. 144-51). Furthermore, Brazilians could opt to vote for these alliances instead of for political parties (p. 23). This is undoubtedly one of the most interesting revelations in the book. From Johnson's discussion, it would appear that these factions and alliances became more programmatic and ideological than the political parties during this period, and consequently perhaps more capable of representing ideas and interests than the major political parties.

In part because of this development, Johnson's effort to describe the changes as the realignment of the party system seems somewhat misplaced. The author defines realignment as "a systematic shift in strength among political parties" (p. 2), or "an important and sustained shifting of political power within the party system" (p. 12). However, the balance of power among the parties appears to have evolved much less—and much less consistently—during this period than the balance between parties, on the one hand, and subparty and cross-party units, on the other hand. To be sure, Johnson does demonstrate a trend in legislative elections toward a shrinking center (PDS) and growing left (PTB) (p. 42). Yet, neither presidential nor regional elections consistently follow the same pattern. Furthermore, leadership—at least at the presidential level-still appeared to be exercised by personalistic leaders with individual followings, rather than strong party ties. Thus, while politics in Brazil did appear to shift overall toward the left during this period, the political parties themselves do not seem to have been strong or cohesive enough to constitute the central players in this "realignment."

Despite the author's intriguing depiction of the different aspects of realignment in Brazil, he does not adequately demonstrate that this realignment led to the 1964 coup. While the coup itself, and the broader question of military intervention, is discussed very little in this book, the information given indicates that the overall political shift toward the left only indirectly motivated the coup. Instead, President João Goulart's leftist program and his efforts to embrace the "Basic Reforms"—a broad, reformist program including goals such as "democratizing the polity" and "reducing inequality" (p. 101)—gave the final impetus for the coup. Since Goulart had initially only been elected vice president, and the elected president (Jânio Quadros) represented a more

conservative party, Goulart's presidency cannot be interpreted as an indicator of leftist realignment. Rather, Goulart fell into the presidency accidentally. The growth of the more progressive FPN and leftist factions in the parties may have given teeth to Goulart's reformist goals, but it does not in itself appear to have motivated the coup.

Johnson's use of counterfactuals further highlights the importance of Goulart's leadership and policies for the coup. Using this approach, Johnson proposes that the outcome (the coup) might have been different had Goulart reacted differently at two points. The first of these was in 1961, when Goulart assumed the presidency. Goulart, from the PTB, had been elected vice president in the 1960 elections. Quadros, a personalistic leader now representing the conservative UDN, won the presidency with over 48% of the vote (p. 49). However, after seven months, Quadros resigned precipitously, and the government entered a severe political crisis, given the opposition to a possible presidency by more leftist Goulart. The military ultimately allowed Goulart to assume the presidency, but only after the rules had been changed in order to weaken the office. The second point was in 1964, when Goulart left the country in the face of the military insurrection. Johnson argues that at both these points, Goulart should have reacted more strongly, mobilizing supporters and standing fast in the face of these constitutional challenges. Although taking such actions admittedly would probably have led to bloodshed, Johnson proposes that Goulart might have managed to prevent the coup by stronger actions (p. 128).

The problem with this argument is twofold. First, as indicated, is that Johnson does not offer sufficient evidence that a change in Goulart's choices would have altered the outcome. The book simply does not provide enough information about the military, military decision making, and coup processes to make this claim, whether or not it is accurate. Secondly, as indicated, if Goulart's actions at either of these two moments could have prevented the coup, then his policies and choices would appear to have had more influence on military intervention than the broader political realignment.

In sum, this book offers an intricate, nuanced, and fascinating analysis of trends in Brazilian political representation during the 1945–64 period. In the process, Johnson makes an important contribution to the literature on party politics. However, efforts to link the study of party politics to the 1964 coup fall somewhat short. The author simply has not provided sufficient information about the coup to be able to explain it, nor does the information that is given support party realignment as a major cause. The book also lacks detail on the history and broader socioeconomic context, which makes it difficult for the reader to understand the links between the political shifts discussed and Brazil's broader social challenges. It is, finally, an excellent book on party politics, but a less successful contribution to the study of Brazil's 1964 coup.

# The Politics of Elite Transformation: The Consolidation of Greek Democracy in Theoretical Perspective By Neovi M. Karakatsanis. Westport, CT: Praeger, 2001. 224p. \$59.95.

Kevin Featherstone, London School of Economics

This is an ambitious and innovative study of the processes of democratization evident in Greece after 1974. It has two major distinctions. Firstly, it is based on an extensive range of personal interviews with some of the protagonists involved, as well as on archival searches. Secondly, the empirical analysis is placed within relevant theoretical frames, and these are used to draw out relevant comparisons with other European states. The book serves, therefore, as both a general introduction

to the turbulent history of the period and a useful source for comparative analysis of democratization processes. The book is highly accessible and readable. With these qualities, it is likely to become the definitive account of the transition to democracy in Greece. Many scholars and students will benefit from it.

In contrast to the repeated images of rancorous leadership squabbles, politics based on naked self-interest, and opponents accorded the utmost suspicion, Neovi Karakatsanis argues that it was the willingness to compromise among domestic political elites that "won" back democracy for Greece. The argument is qualified, however. Firstly, despite a shared opposition to the junta, the politicians could not bring themselves to negotiate a full settlement. Instead, agreements came in installments. Goodwill was restrained by timorous footsteps on the basis of careful calculation. Secondly, the gradual progress toward democratization was kept on track by the personal monopoly of power by Constantine Karamanlis. So, the cultural history of leader dependence was once again crucial.

The stress on theory in the title is potentially misleading. While the analysis is framed in the context of two competing theoretical approaches to democratic consolidation—elite settlement (following bargaining that overcomes traditional differences) and elite convergence (a two-phase process of elite collaboration)—the bulk of the analysis is empirical.

Not unusually, the book concludes on Greek exceptionalism: Reality requires a revision of the elite convergence model developed in other national contexts. Some of the justification for exceptionalism seems overstated. The elite convergence model need not be as restrictive as Karakatsanis assumes; the electoral logic on which it rests can be interpreted more broadly. Moreover, it is asserted both that the origins of elite consensus preceded the junta and that it was the result of the experience of the transition (p. 16). The main theoretical contribution is to argue that the convergence model must be disaggregated to capture "an often bewildering variety of elite motivations and dynamic processes" (p. 175). These include the logic of party building and a normative commitment to the establishment of an inclusive, stable democracy, based on drawing the appropriate lessons from modern Greek history. By contrast, no elite settlement or pact was negotiated; "politics remained a win-lose, zero-sum competitive game" (p. 176). For its part, the military first acted in compliance with democracy and then, differentially, imbued the values of civilian control. The theoretical frames are useful in allowing cross-national comparisons to be drawn. The author draws a limited number of parallels with countries elsewhere in southern Europe.

The author expertly dissects the interests and motivations behind the embrace of the new regime by each of the major political parties. The Pan-Hellenic Socialist Movement (PASOK), created by Andreas Papandreou in 1974, was reconciled to moderation not only by electoral calculation—there is much stress here on its cynical opportunism—but also by a range of other considerations, such as foreign policy interests and the constraints of government. Much is made of the difference between PASOK's initial radicalism and its gradual acceptance of the basic constitutional order. The party's early radicalism is seen as helping to integrate the disaffected antiestablishment voters, carrying them with the party along the road to moderation and helping the new system to mature.

The analysis is heavily rooted in a synthesis of the views expressed to Karakatsanis in the extensive range of (anonymous) interviews that were obtained. This produces an eclecticism of interpretation, but there is value in this. While the arguments are not highly original, they are more firmly

anchored in empirical evidence than is sometimes found elsewhere.

The net result of the process of democratization, the author argues, is that Greece has a stable and consolidated "yet low quality democracy" (p. 173). The "quality" is impaired by the abuses of state patronage and a skewed, fragmented social welfare system. The terminology might be awkward, but the focus on these agendas is apt. Both are the prime foci of much of the current political debate in Greece (and beyond). And both are symptoms of the processes of "modernization-cum-Europeanization" underlying so much of contemporary Greek politics. But that should be the subject of another book.

Has Liberalism Failed Women?: Assuring Equal Representation in Europe and the United States Edited by Jytte Klausen and Charles S. Maier. New York: Palgrave, 2001. 243p.

Noelle H. Norton, University of San Diego

Over the past decade, while the United States effectively decided that liberalism could not accommodate quotas or affirmative action plans designed to alleviate gender and racial inequality, Europe decided that liberalism could accommodate a form of positive discrimination. As the U.S. Supreme Court systematically rolled back affirmative action plans and the state of California led the initiative to curtail government and educational affirmative action, countries like France, Germany, and Norway were implementing a variety of parity policies at both the constitutional and political levels. The parity movement that gained strength in Europe in the 1990s called for equal representation of both men and women in elected assemblies. Methods for achieving parity ranged from reserving parliamentary seats for female legislators by means of constitutional change to legal gender quotas in party lists and party rules. The editors of this volume point out that the Europeans have implemented these electoral reforms with "little public outcry" and "no manifestations of mass protests."

The essays the editors include address the challenges that parity presents democracies on the basis of liberal theories of representation, the institutional context in which parity has been implemented in Europe, and the concerns opponents of parity raise both in Europe and the United States. On the whole, the contributors present a broad and balanced analysis of the theoretical justification for parity and the concerns expressed by those who have experienced its implementation. Jytte Klausen and Charles Maier include essays by several prominent academics from Europe and the United States, political activists tied to the parity movement, and elected officials and jurists who currently face legal challenges to parity.

Although the editors note in their introduction that they present these essays for the purpose of discussion and not advocacy, it becomes clear after reading each one that they have serious reservations about political innovations that strengthen gender rights at the procedural level before more substantive rights are secured. Despite the placement of the argument by Jane Mansbridge (Chapter 2) at the front of the book, that "representation is best performed by descriptive representatives" (p. 19) and that the case for 50% female representation "is strong on historically contingent, non-essentialist grounds" (p. 33), a set of potential pitfalls and unintended consequences to parity legislation and parity party rules are also introduced as a primary theme early in the book.

In fact, the editors weave three kinds of concerns throughout alternating chapters in the book. First, several essays warn that the parity movement might stimulate a political backlash, similar to the affirmative action backlash in the United States, which will undo feminists gains in Europe. Others claim that the parity movement has focused on limited goals of electoral politics and sacrificed more substantive or controversial gender justice goals. Finally, some contributors caution that parity will not promote a feminist agenda because women from both the Right and the Left have been supportive of the movement.

These "cautionary tales" told by several contributors only enhance the dialogue the editors provoke with the book. They have carefully placed essays supportive of parity among the essays that are more cautious of or opposed to parity. In fact, the arrangement of the chapters places the reader in the center of the intellectual debate over the compatibility of parity with classical liberal democracies, making this book a pleasure to read. Readers from the United States will find themselves excited by this bold European experiment at the same time they recognize the cautionary arguments against these proposals.

The book divides the parity dialogue into four basic sections: "Theoretical Perspectives"; "Parity as an Electoral Issue"; "The Policy Process"; and "Cautionary Tales." In the first section, the editors introduce the theoretical discussion they will lead the reader into over the next 14 chapters. Essays by two academics showing contrasting perspectives are juxtaposed in Chapters 2 and 3: one by Jane Mansbridge from the United States supporting the compatibility of parity with liberalism and the other by Clause Offe from Germany opposing procedural mechanisms for overcoming gender injustice. The section concludes with a descriptively rich essay by Francoise Gaspard, the French scholar who coauthored the book that started the parity movement, stating that parity will only deepen democracy.

Gaspard's essay offers a nice transition into the second and third sections where the diverse European experience with parity as electoral politics and governmental policy is explored. Notable essays in these sections include one by Isabelle Giraud and Jane Jenson (Chapter 5), who contend that parity was promoted in France only because it was noncontroversial and left aside more important social and economic change for women. Another essay by Anna Coote (Chapter 7), a former consultant to the Labour government's minister for women in Great Britain, similarly claims that the Labour Party used parity only to win the election and left feminism "in the wilderness: wanted on the voyage, but not on arrival" (p. 111). On the other hand, several other essays in this section tentatively support parity in principle and practice. For example, in a well-researched case study of the British Labour Party's adoption of all-women shortlists in 1997, Pippa Norris (Chapter 6) shows that positive discrimination policies can transform legislative bodies when more women are included. Similarly, Christiane Lemke (Chapter 8) and Hege Skjeie (Chapter 10) write that parity dramatically increased the number of women legislators in Germany and in Scandinavian countries, respectively. Perhaps the essay by Agnes Hubert (Chapter 11), describing the European Union's effort to advance gender equality, best represents the cautionary tone of the book. Although Hubert praised the EU for supporting parity democracy, she warns that parity must be about greater gender equality and not simply about a greater number of women in political office.

In the final section of the book, the editors fully reveal their preferences by including essays that emphasize the pitfalls surrounding parity implementation in Europe and skepticism about parity adoption in the United States. Both Rogers Smith (Chapter 12) and Jytte Klausen (Chapter 14) contend that parity serves as a "quick fix" to political equality. Smith argues against expanding the political representation of women if it means giving up efforts to secure greater social change, while Klausen shows in a study of the conservative gender gap that a consequence of parity might be the depoliticization or neutralization of gender.

As noted, Has Liberalism Failed Women? puts the reader into what the authors would call a transatlantic intellectual dialogue about the merits of parity inside liberal democracies. Although the debate is lively, the essays diverse, and the contributors all prominent in their fields, the book is not flawless. The editors might have provided a more comprehensive introduction to these essays. At times, the redefinition of parity and parity policy alternatives inside each essay became redundant. Finally, a few of the contributions were not as fully developed or clearly linked to the larger themes of the book. However, none of these minor flaws detract from the overall value of this thoughtful and provocative book. Students of legislative politics and liberal political theory will find it as valuable as will those who are already immersed in the debate about the most appropriate methods for instituting gender justice.

Russia's Unfinished Revolution: Political Change from Gorbachev to Putin By Michael McFaul. Ithaca, NY: Cornell University Press, 2001. 384p. \$35.00.

The Russian Parliament: Institutional Evolution in a Transitional Regime, 1989–1999 By Thomas F. Remington. New Haven: Yale University Press, 2001. 288p. \$40.00.

M. Steven Fish, University of California, Berkeley

Each of these books is, in its own way, a tour de force; each provides the best book-length account and analysis available to date on its subject. Michael McFaul's book offers a major contribution to thinking on regime change in general, as well as a fine account and analysis of Russia's transition from Sovietism. Thomas Remington's book, which investigates the nascence and internal operation of the Russian legislature, powerfully advances our understanding of the Russian parliament and the formation of political institutions more generally. Both books are scholarly and sophisticated, but each is also elegantly written, well organized, and accessible to the nonspecialist. Both authors were present at the creation of the new Russian political order, and each book is deeply informed by extensive interviews and first-hand observation.

Remington uses the argot of game theory, while McFaul prefers the language of what has become known as the transitions literature. Yet each book emphasizes the importance of unintended consequences and critical junctures, and each argues that the institutions that have evolved in Russia since the late 1980s are best understood as the products of political struggle, rather than of a preestablished correlation of social forces, structural factors, or cultural predispositions. Each book asks not why Russian democracy has failed to flower fully, but rather how Russia has skirted the trap of dictatorship and managed to create some lasting institutions that regulate political competition and provide for some degree of civil peace and political openness.

Remington's book argues against the common view that casts the Soviet parliament of 1989–91, the Russian parliament of 1990–93, and the post-1993 Russian parliament as radically disparate and largely disconnected institutions. Remington sees the development of parliamentary structure as incremental, and he unearths key sources of institutional continuity. He shows how bicameralism and partisanship, in particular, emerged and gained recognition over the lives of

all three parliaments, and he sees the post-1993 parliament as deeply influenced by its institutional predecessors. He discovers processes of learning and adaptation within and across parliaments over time, with legislators growing increasingly adept at bargaining, rule making, and rule following. He makes a powerful case for regarding parliamentarism in Russia as a work in progress.

Remington also takes on the conventional view of the Russian parliament as an anemic and inconsequential institution. He is fully cognizant of the formal limitations on the legislature's power. But he sees parliament as having expanded its prerogatives since 1993, and he holds that it has at least managed to make the president take his own constitution seriously. He argues that the growth of parliamentary capacity has enabled legislators and parties to check and tame executive power. Remington makes a strong case, detailing a record of legislative accomplishment and uncovering areas in which the parliament and the president are in continual discussion and negotiation. Still, on this score, this reviewer is not entirely convinced. Surely Remington is right to argue that parliament has turned out to be more than the decorative and toothless body that many observers expected it to be-and that the president perhaps wanted it to be—at the time of the constitution's passage in late 1993. But the president's decree powers and control over the government, judiciary, and state media, the absence of meaningful parliamentary oversight powers, and the enormous disparities in resources that prevail between the sprawling executive branch and a parliament that employs a staff with but a single personal assistant for each deputy make it difficult for the legislature to check the president in most areas of policymaking and implementation. This is not to deny that parliament may be, as Remington argues, a consequential and articulate political actor. I do, however, question whether the parliament really can, on an ongoing basis, tame executive power and force the president to abide by

Whereas Remington focuses on a particular institution within the broader context of regime change, McFaul seeks to explain the character of regime change itself. McFaul's dependent variable is the emergence/nonemergence of stable rules for open political competition. His cases are the Gorbachev period (1985–91), the Russian First Republic (1992–93), and the Russian Second Republic (1993–present). He argues that the first two cases represented failures at building lasting institutions for regulating political competition, while the third case, at least in relative terms, has been a success. His main explanatory variables are perceptions of the balance of power among political antagonists and the scope of the contested agenda for change.

McFaul holds that a relatively equal balance of power between rival political forces that leads to political stalemate, particularly when the balance of forces is unclear to the protagonists themselves, is more likely to produce breakdown than is a circumstance in which one side has triumphed unequivocally and managed to impose its own rules unilaterally. Here McFaul challenges Dankwart Rustow's notion regarding the potential virtue of evenly balanced, protracted conflict for producing the compromises—and eventually the rules and agencies—that institutionalize competition and keep it peaceful. According to McFaul, the balance of forces between the main political protagonists was relatively equal and entirely unclear during the Gorbachev and early post-Gorbachev periods. After the unequivocal triumph of Yeltsin over his communist and nationalist opponents in the armed conflict of 1993 and the adoption of a new constitution that resolved the battle between the president and the parliament in the president's favor, however, the balance of forces

tilted decisively toward the presidency and specifically toward Yeltsin and his political program. The clarification of power relations created the basis for the emergence of a system in which even opponents of the government and of the new regime had an interest in playing within the established rules. The adoption of the new constitution, the passage of time, and the practice of elections under clearly specified rules helped pull even avowed opponents of the post-Soviet regime into the electoral game and ultimately advanced both stability and democratization.

McFaul makes clear that he is aware of the potential tensions between the advantages of greater clarity and disparity in the balance of power, on the one hand, and democratization, on the other, and he grapples with this tension throughout his account of Russian politics after 1993. Still, in this reviewer's opinion, McFaul might underestimate the perniciousness for democratization—if not necessarily for short-run political stability—of the lopsided balance between Yeltsin and his opponents that emerged from the ashes of the 1993 conflict. Yeltsin's victory and his ability subsequently to win approval in a referendum for a draft constitution that expressed his own preferences in nearly unadulterated form did establish some institutional clarity. Outside of Chechnya, moreover, Russian political competition has become less bloody and chaotic since 1993. But during the past half decade, little worthy of the name "democratization" has occurred in Russia. The very institutions—especially the weakly constrained executive—that helped bring some order to the system initially are also impeding democratization and may even become sources of political instability and state failure.

Another of McFaul's major arguments is that the wider the scope of the agenda for change, the less likely a new democratic regime will emerge. Multiple, simultaneous transformations are harder to manage, and more likely to derail democratization, than are transitions where challenges can be managed sequentially and discretely. The breadth of contested terrain, according to McFaul, was exceptionally expansive in Russia during the Gorbachev period and the first two years of the post-Soviet era. The shape of the state itself and the battle between capitalism and socialism in the economic sphere were under dispute. But settlement of problems of state autonomy and independence during the early post-Gorbachev years, as well as the elimination of the option of a return to a command economy following Yeltsin's victory in the armed clash of 1993, narrowed the terrain of contest and enabled politicians to concentrate on—and productively fight over—political institutions. This reduction in the scope of the agenda for change helped stabilize politics. This argument is not counterintuitive, but nor is it easy to demonstrate in practice, and McFaul does an excellent job of laying out precisely how this dynamic worked.

This reviewer does not fully embrace the arguments made in either book, but they are vigorously and skillfully made. Each book is a model of rigorous, theoretically informed qualitative analysis. Both authors define their terms with precision, map out and explicate their causal arguments clearly, and present prodigious amounts of empirical evidence.

Together with Eugene Huskey's Presidential Power in Russia (1999), The Russian Parliament and Russia's Unfinished Revolution represent the most ambitious and successful book-length efforts to date to grapple with institutional genesis and transformation in post-Soviet Russia. The books focus on a single country, but their arguments are not case-specific. These works richly merit, and are already gaining, a broad audience among theoretically minded comparativists.

Black Atlantic Politics: Dilemmas of Political Empowerment in Boston and Liverpool By William E. Nelson Jr. Albany: State University of New York Press, 2000. 344p. \$74.50 cloth, \$25.95 paper.

Toni-Michelle C. Travis, George Mason University

Studies of local politics have often narrowly focused on elites, the role of competing interest groups, or the influence of the business community in making key decisions. Nelson's comparative study raises the level of discourse by drawing our attention to the often overlooked role of blacks in municipal politics. In comparing Boston and Liverpool the study expands our understanding of the similarities between racial politics in the United States and in Great Britain.

Organized in a readable manner, the book provides two opening chapters to frame the comparison. The chapters on Boston and Liverpool are designed as case studies, with a concluding chapter that allows one to focus on one city at a time.

Building on the literature of two fields, cultural politics and local government, Nelson presents a systematic study of the problems of blacks seeking empowerment on both sides of the Atlantic. In previous works on local government, blacks were merely incidental, while the focus here makes blacks central to the study.

As suggested by Paul Gilroy in The Black Atlantic (1993), the ocean provides a link between Britain and the North American colonies because of cultural commonalities and the experience of the slave trade. This examination of contemporary Liverpool and Boston reveals two communities trying to attain political empowerment. Two cities separated by an ocean exist where racial domination places the black community in a subordinate position as the recipients of policy outcomes, not partners in shaping policy, as the objects of institutional discrimination, and often as the victims of police harassment. The comparative analysis is framed in terms of the structure and budgetary constraints of local government, the relationship of the local government to the central government, the responsiveness of governing institutions to the black community, the resource level of the black community, and the ability of the black community to mobilize its resources to influence the public agenda. The beauty of the comparison is that it shows that race is a major force in determining policy in what appear to be two dissimilar

Comparative studies, although often complicated, elucidate key similarities. In examining two port cities Nelson finds racial hierarchies in which whites have been intransigent in response to black demands for representation and inclusion in governing circles. By focusing on political linkage between the black community and the local government, Nelson clarifies the subtleties of ongoing problems of racism and internal conflict within the black communities of Boston and Liverpool.

This comparison, however, notes one important difference between the two cultures with regard to race. The role of the state in the British system is different because there is no de jure history of discrimination and segregation. Consequently, there is no official acknowledgment of the overt prejudice that is practiced. With the general denial that race is an issue and not state policy, opposition to racism as well as hope of achieving any political power at the local level becomes difficult.

This is a pioneering study that will lead other scholars to examine the continuing problem of black empowerment in democratic cultures. Nelson's work shows that the problem is far from solved. Race continues to matter in local politics on both sides of the Atlantic. Nelson presents a solid,

well-documented study. However, it would have been enhanced by his paying greater attention to the West Indian dimensions of protest politics in Boston, where activists more often than not are of West Indian descent.

With regard to Liverpool, while it remains difficult to achieve unity and to build coalitions, an overlooked dimension is the impact of the immigrant policy on racial politics. If immigration increases, then the black population will grow and place increasing demands on the system.

This seminal work invites future studies analyzing the connection between politics and policy outcomes on both sides of the Atlantic where race is a prime factor. Future studies of local government will certainly need to examine structure, political linkages, and policy outcomes, but with race as a key actor, not a bit player. Immigration will continue to impact the local policy as residents of commonwealth countries continue to move to Great Britain. Boston, too, is experiencing population shifts, with more people of color from the Caribbean and Latin America becoming Boston residents as whites flee to homogeneous suburban enclaves. The story is not over. It will be a long struggle for empowerment unless more common ground is found for coalitions in both communities. Black Atlantic Politics will prove to be the guide for assessing future political empowerment in the Atlantic context.

Debating Governance: Authority, Steering, and Democracy Edited by Jon Pierre. Oxford: Oxford University Press, 2000. 251p. \$60.00 cloth, \$24.95 paper.

Christopher Ansell, University of California, Berkeley

If you remain befuddled, perplexed, or even a bit hazy about why scholars have shifted in the last decade from talking about "government" to talking about "governance," this is the volume for you. Debating Governance, edited by Jon Pierre, brings together a diverse group of scholars to analyze the meaning and value of this concept within their respective subfields. The title of the volume may, however, be ambiguous. These scholars are not debating the meaning and value of the term governance among themselves. The contributors to the volume generally agree that governance is a useful and valuable concept. Despite differences in emphasis, perspective, and language, the authors generally agree about why we must shift from talking about "government" to talking about "governance." The debate, if there is one, is with those who would deny or ignore fundamental changes in the way in which we govern ourselves over the last several

So what is this concept governance? There is no doubt that the term means different things to different people, and many of the authors in the volume show a healthy self-consciousness about what the term implies. The essay by Rod Rhodes, for example, identifies seven distinctive meanings of the term (pp. 58-60). However, I believe that these seven distinctive meanings are usefully reduced to two broader connotations. In the field of corporate governance, in new public management, and in the "good governance" movement associated with the World Bank, the term tends to signify the pursuit of fiscally responsible, efficient, and accountable organizations. Best business practices are advocated as a means to effective governance. In contrast, the other four meanings identified by Rhodes—governance as international interdependence, sociocybernetic system, new political economy, and networks—all refer to the ways in which activities of governing are now distributed over a much wider group of actors than they were in the past, none of whom can unilaterally control outcomes. Hence, governance

implies a process of coordinating and conciliating multiple actors

The authors of this volume all lean toward the second of these two connotations. As a number of the authors explicitly point out, governance suggests the shift from a "state-centric" model of governing (hence, "government") to a model in which authority and power are much more widely distributed. This distribution of authority and power places (or reflects) constraints on the ability of the state to govern unilaterally. Governance, with its emphasis on process, implies that governing now requires new institutional forms and a more intensive engagement between state and society. In his introduction to the volume, Pierre announces a central theme of the volume: "As the state's traditional power bases seem to be losing much of their former strength, there has been a search for alternative strategies through which the state can articulate and pursue the collective interest without necessarily relying on coercive instruments" (p. 2).

Skeptics may note that the state-centric model was never an adequate model to describe governing. They might wonder whether governance is much different from conventional pluralist accounts of governing. Such a critique might surprise the authors of the volume, because their "debate" is really directed toward those who remain wedded to the state-centric model. However, I think that their response might be the same to skeptics from both state-centric and pluralist camps. Governance seeks to acknowledge and call attention to the relative shift away from the state-centric model of governing toward a more pluralist model. The end result does not fit into either the state-centric category or the opposing category of society-centered pluralism. While constrained, the state remains too active and interventionist in the governance model to be described in conventional pluralist terms. As Pierre points out in the introduction, the contributors to the volume agree that governance reflects the transformation rather than the decline of the state. How, otherwise, can we understand the volume's many references to the state's role in "steering"? Although Paul Hirst's essay does champion a shift to societycentered governance, the state retains a critical, if reduced, presence in the governance models described by most of the other authors. Pierre describes governance as follows: "Governance has a dual meaning; on the one hand it refers to the empirical manifestations of state adaptation to its external environment as it emerges in the late twentieth century. On the other hand, governance also denotes a conceptual or theoretical representation of co-ordination of social systems and, for the most part, the role of the state in that process" (p. 3).

The great strength of this volume is the way it situates the concept of governance in many subdisciplines. Paul Hirst explores the tension between governance and democracy and advocates associative democracy as a framework for reconciling the tension. B. Guy Peters suggests that a comparative politics perspective on governance should ask, "Are certain types of political systems apparently better at steering and control than are others?" (p. 36). Rod Rhodes revises his well-known network model of public administration from the perspective of an "anti-foundational" epistemology. Gerry Stoker places governance in the context of the literature on urban growth coalitions and public-private partnerships. Andrew Gamble describes governance in terms of the evolving role of the state in the economy. Jan Kooiman's model of "social-political governance" emphasizes that public-private interactions have shifted from "one-way traffic" to "two-way traffic" (p. 142). James Rosenau elaborates his model of global "governance without government" by conceptualizing the nature of global change (p. 172). From a new political economy perspective, Anthony Payne describes projects of supranational regionalism as modes of governance. Alberta Sbragia analyzes the European Union as a form of governance that relies heavily on regulation, information control, and fiscal poverty.

Thus, the contributions to this volume cover an enormous range of perspectives. They are also well written and informative. Combined with the effective introduction and conclusion by Jon Pierre, they comprise a useful text for introducing the concept of governance to advanced undergraduates or graduate students.

Grassroots Expectations of Democracy and Economy: Argentina in Comparative Perspective By Nancy R. Powers. Pittsburgh: University of Pittsburgh Press, 2001. 294p. \$45.00 cloth, \$19.95 paper.

Steven Levitsky, Harvard University

As the recent political meltdowns in Venezuela and Argentina made clear, a vast gap persists between elite behavior and mass attitudes in much of Latin America. Scholarly understanding of this gap—and its political implications would benefit from more fine-grained, yet theoretically informed, studies of nonelites. Nancy Powers's Grassroots Expectations of Democracy and Economy is one such study. Drawing on in-depth interviews with 41 residents of two lower-income neighborhoods in Argentina's federal capital, Powers examines how poor people understand their own interests. She argues that people experience poverty in vastly different ways, and this variation has important implications for political behavior. Thus, to understand how poor people view the relationship between their own material conditions and government policy, one must examine "the conditions themselves and how people live with them" (p. 33). This kind of inductive analysis has important and well-known limitations, particularly for studies—such as this one—based on a small sample size. Yet given how little we continue to know about the relationship between mass attitudes and macrolevel politics in Latin America, such a "bottom up" approach should be welcomed. To the extent that fine-grained inductive research generates insights that 1) are unlikely to emerge out of larger-n studies and 2) challenge or refine dominant theoretical assumptions, it can be extremely fruitful. This is the case with important sections of the book.

Grassroots Expectations offers a wealth of insights into the conditions under which poor people respond—or do not respond—politically to material deprivation. Chapter 3 uses the case of low-income housing to show how variation in living conditions shapes poor people's political interests, as well as their capacity to act collectively. Thus, shantytowns are more likely to foster perceptions of shared housing interests and collective demand-making than are arrangements like "residence hotels" or abandoned buildings. More generally, Powers finds that the extreme heterogeneity of housing hinders collective mobilization, as the residents of hotels, abandoned buildings, and shantytowns "do not acknowledge a set of common shelter problems not do they seek similar solutions" (p. 85).

The book's core insights are found in Chapter 5. The chapter opens with typology of three possible orientations toward politics: 1) a microfocus, or a focus on private solutions to one's material problems, without attention to macropolitical issues; 2) macrofocus, or engagement with macrolevel political issues, but without making a link between these issues and personal material needs; and 3) micro-macro linkage, or an understanding of one's personal material problems (and their potential solutions) in terms of macrolevel politics. Powers is most interested in this third category, and the bulk of the chapter explores the conditions that give rise to a micromacro linkage. For the poor, the first response to pressing

material need is usually to "cope" individually, via a combination of informal sector employment, state welfare programs, private charities, and local partisan patrons. These coping mechanisms are described with a richness that is unusual in contemporary political science. Powers finds a strong relationship between perceived capacity to cope and attitudes toward the government. Those who view themselves as unable to cope are more likely to link their personal material needs to government policy than are those who perceive themselves as coping adequately. Although it is worth considering the possibility that the causal relationship is reversed (people who are ideologically disposed toward privatist thinking may be likely to say they can cope on their own), Powers's argument generates some interesting insights. It sheds light, for example, on the political salience of high inflation. Because hyperinflation so dramatically affects the poor's capacity to cope, it generates more intense macrolevel demands than do such economic problems as housing scarcity, low salaries, and even unemployment. This helps to explain why many poor and unemployed Argentines voted for Carlos Menem in 1995: Because hyperinflation made the micro-macro linkage salient for many voters, the electoral benefits of resolving it were greater than the costs associated with not resolving many other problems affecting the poor.

Though largely persuasive, the chapter understates the role of partisan clientelistic networks. Clientelistic networks—most of them Peronist—are pervasive in most low-income zones in Argentina, and they undoubtedly shape the way the poor interpret and engage in politics. The book understates the role of clientelism because it draws its sample from the federal capital, which is not representative of the country as a whole. Because it is wealthier, better educated, and more open to mass media influence than the rest of the country, the capital is characterized by substantially less clientelism. Had Powers drawn her sample from Greater Buenos Aires or the northern interior, her results might have been quite different.

Chapters 6 and 7 provide fewer original insights, and its major findings do not depart substantially from those of many large-n surveys. Chapter 6 presents respondents' views of the Menem government and various political alternatives. Readers may find the chapter too anecdotal, and its various references to parties and politicians that soon disappeared may quickly date it. The chapter concludes with the assertion that poor Argentines are stuck in a "static" Peronist identity that inhibits them from effectively pursuing their interests (p. 178). This characterization smacks of the false consciousness arguments that progressive scholars have made about Argentine workers since the 1940s and is inconsistent with the book's effort to take grassroots views seriously. Chapter 7 examines popular sector attitudes toward democracy. Although Powers found that the bulk of her respondents supported liberal democracy, many were "effective liberal democrats" (rather than absolute liberal democrats), in that they were willing to accept some illiberal actions (including closing the congress) for the sake of effective government. Powers concludes that support for democracy in Argentina is "context driven," rather than rooted in a "recognition of democracy's inherent values" (pp. 208–9).

In the excellent conclusion to Grassroots Expectations,

In the excellent conclusion to *Grassroots Expectations*, Powers links her findings to broader comparative theory. The chapter offers a critique of studies that characterize governments, such as those of Menem and Peruvian President Alberto Fujimori, as "neopopulist," arguing that such analyses pay insufficient attention to why poor people support them. According to Powers, both Menem and Fujimori substantially enhanced the individual security of poor citizens, and that enhanced security, rather than neopopulist appeals,

best explains their lower-class support. Powers also evaluates her findings in light of dominant theories of voting, arguing that although micro-macro linkage (or "pocketbook voting") is generally treated by scholars as unsophisticated political behavior, it may be quite rational in developing countries, where public policy often has tremendous impact on poor peoples' lives. Indeed, an ability to turn microlevel needs into macrolevel demands may be critical to effective citizenshipand to closing the elite-mass gap—in Latin America. Powers might have pointed out that contemporary patterns of economic liberalization, state retrenchment, mass party decline, and the decentralization and NGOization of social policy have further eroded the conditions facilitating such micromacro linkages. If her argument is correct, then these developments may have important negative implications for the quality of citizenship in Latin America.

Political Transition in Cambodia 1991–1999. Power, Elitism and Democracy By David W. Roberts. New York: St. Martin's Press, 2000. 259p. \$40.00.

Patrick Vander Weyden, IPSoM/Catholic University of Brussels-ISPO/Catholic University of Leuven

In this book David W. Roberts provides an interesting descriptive account of recent Cambodian politics. The guiding principle of his study is the evaluation and implementation of the Paris Peace Agreement (PPA), which was signed in 1993. The main thesis in the book is that the content of the PPA mainly served the interests of international actors such as the United States and China, without taking into account the Cambodian political reality. In Roberts's view, the PPA developed from the Western ideal of liberal democracy, with multiparty elections as its central component and with total disregard for the Cambodian political context.

According to Roberts, the causes of the Cambodian conflict were still present after the signing of the PPA. In fact, "the significance of the conflict had not changed. It remained a vital struggle for political survival in an extremely hostile environment where the consequences of absolute defeat and marginalisation could be dire, and far more exaggerated than in western systems upon which the chosen model of polling was based" (p. 32). Cambodian political and social life is dominated by a system of patronage and clientilism, which is strongly hierarchically structured. Holding a political position in this system means having access to sources of personal wealth and the possibility of serving associated dependent groups of people. In addition, the Cambodian political elite is characterized by a lack of democratic values. Concepts such as cooperation and constructive opposition are of little substance to them. Furthermore, the lack of a democratic mechanism to solve conflicts, the dramatically poor economic situation, and the overall presence of arms make the ideal of the PPA and its implementation in the field even more unrealistic.

Roberts explores the lack of a democratic culture of the Cambodian political elite in view of the behavior of the different Cambodian actors in the period between 1991 and 1999. It becomes clear through the reading not only that the autocratic nature of the political elite was characteristic of Cambodia's governing People's Party (CPP), but also that other parties, such as the Sam Rainsy Party (SRP), are practicing undemocratic values. This is evident in the way the political parties behaved during the 1993 and 1998 elections and in the way the period in between was governed by a coalition government of the CPP and Front Uni Nacionale (FUNCINPEC). After the 1993 elections, with FUNCINPEC the winner and CPP coming in second, the CPP refused to

accept the election results. Only after the coalition government was installed was a nonviolent political climate restored. The forming of this coalition government is yet another illustration of the nondemocratic climate of the country because in Cambodia in 1993 having a coalition government simply meant that for each political department two ministers were appointed, one FUNCINPEC minister and one CPP minister. More or less the same thing happened after the 1998 elections. The CPP won the elections, FUNCINPEC came in second, and the Sam Rainsy Party third. Again, immediately after the elections, political parties did not want to accept the results, with a violent and aggressive atmosphere as a consequence. Finally, a nonelected senate was formed, which saved FUNCINPEC the affront of losing most of its power.

In the same critical fashion Roberts analyses the functioning of the United Nations Transitional Authority in Cambodia (UNTAC), which was responsible for the implementation of the PPA and the conduction of the 1993 elections. According to Roberts the UNTAC did not succeed in creating a politically neutral environment, which was a precondition for "free and fair" elections, as stipulated in the PPA. The late deployment of the UNTAC, the inefficiency and ineffectivity of the deployment, the unsatisfactory disarmament, and the failure to separate the state administration from the governing party, CPP, are especially strongly criticized by Roberts. Roberts advances—in an impressively well-documented way—the uncommon proposition that the Khmer Rouge left the 1993 election process because the UNTAC was not able to create a politically neutral environment, which made it impossible, in the perception of the political leaders of the Khmer Rouge, to make their comeback in Cambodian politics by participating in the elections.

Although it is obvious that Roberts's detailed descriptions are the result of an accurate and critical analysis of primary written documents and in-depth interviews, he judges the transition process too harshly. Undoubtedly, there are still strong autocratic and nondemocratic values present within the Cambodian political elite. Certainly, the threat and the use of violence in a political context are still present. It is also true that the United Nations' implementation of the PPA was not very successful. Roberts seems to reject the idea of holding elections in an environment characterized by non-democratic values such as clientilism, patronalism, noncooperative experience, and violence and, last but less developed in the book, in an environment of poverty. Roberts leaves one crucial question unanswered: What would the alternative be?

Furthermore, Roberts's definition of democracy is rather stern and rigid. Consider, for example, the way he depicts the democratic attitudes of the Cambodians: "Many Khmers were thus not consciously voting for a transformation of political ideology and for democratic change. Many voted because doing so allowed them to make choices about who would best improve their socio-economic lot" (p. 205). It is unclear why voting for a party for this reason should be undemocratic. Elections are essentially about enabling the voter to establish his or her own priorities and to choose freely between parties. The high levels of turnout in both the 1993 and the 1998 elections clearly show that the Cambodian people want to express their vote and that they want to choose between parties, whatever reasons they might have.

Of course, it is too early to call Cambodia a democratic country, as evidenced most clearly by Roberts's extensive description of the autocratic behavior of the country's political elite. But it is worth taking into account that the transition from a nondemocratic to a democratic system takes time and that international support and pressure can achieve the desired effect of democratic values in the long run.

Palestinian Women: Patriarchy and Resistance in the West Bank By Cheryl A. Rubenberg. Boulder, CO: Lynne Rienner, 2001. 318p. 359.95.

Sara Roy, Harvard University

Several years ago, not long before the signing of the Oslo agreement, I was in a refugee camp in the Gaza Strip. As I was walking through the camp with a male friend, a woman whom I did not know approached me. She gently took my arm as if we were intimate friends, pulled me close, and said, "I have nothing left to feed my children but black milk." She then turned and walked away, leaving as imperceptibly as she had approached. My male friend immediately dismissed her as crazy. Yet I have never forgotten this woman or our momentary but wrenching encounter. It was not only the poignancy of her words that struck me, but their poetry. Her message to me was one of ultimate despair: I can no longer nourish my children. What good am I?

I again was reminded of this encounter after reading Cheryl Rubenberg's fine and beautifully crafted study of Palestinian village and camp women in the West Bank. The author, who is an associate professor of political science at Florida International University, is well known for her work on the Palestinian-Israeli conflict. In this work, Rubenberg has opened a door into a critical segment of Palestinian society few have entered and has given voice to women who are rarely heard within their own societies, let alone beyond them. Over 60% of Palestinian women in the West Bank live in villages and refugee camps. Yet many, perhaps most, studies of Palestinian women have focused on the far smaller segment of urban, upper- and middle-class women who are educated and politically active and whose lives bear little resemblance to those of the women in Rubenberg's study. Indeed, despite certain differences between rural and camp women, Rubenberg clearly shows that these two female populations share more in common with each other than either does with urban

Rubenberg's central argument is that the core of gender inequality in Palestinian society resides in patriarchal control and the repression of female sexuality. She argues that tradition and culture-more than religion-perpetuate women's oppression in village and camp societies. The primary site of patriarchal relations—male domination and female dependency—is the family, and these relations are replicated and diffused through all other institutions of society. Women's oppression is deepened further by Israel's repressive occupation, which has undermined the economic and political base of Palestinian society. The study focuses on the ways in which "gender roles and relations have been constructed by determinate social institutions and how they have been formed, deformed, transformed, and reproduced from the perspective of the women who live within this institutional framework" (p. 9).

This case study examines a distinct group of women who find themselves at a particular and extremely difficult moment in history, a moment shaped by many factors: the failure of the first Palestinian uprising and the Oslo peace process to achieve political and economic sovereignty; the emergence of, and subsequent opposition to, a corrupt and authoritarian Palestinian regime; the rapid and widespread impoverishment of the Palestinian people in both the West Bank and Gaza; and the failure of the women's movement to achieve needed changes in patriarchal roles and relations. It is important to note that the women's movement virtually abandoned grassroots women during the years of the peace process, when many nongovernmental organizations, including those run by women, became professionalized, responding to the needs of donors rather than to those of their own constituents. Indeed,

given the profound problems and pressures facing rural and camp women and their limited access to resources of any kind, the abandonment of these women by their urban and elite counterparts is nothing short of shameful.

The strength and importance of this book lie in Rubenberg's extensive and painstaking field research, which produced literally hundreds of hours of interviews conducted with 175 respondents. Hers is not a theoretical study but an empirical one. Although theory is minimized, it is not negated—its relevance and importance are made clear. What emerges then is a powerful, moving, and, at times, disturbing portrayal of Palestine's poorest and most oppressed women. Yet these women are not monolithic or homogeneous. They reveal remarkable diversity on a variety of issues and trenchant insight, in many instances, into their own condition and its sociological underpinnings as well as strategies for negotiating and resisting their social, economic, and political reality.

It is clear from this and many other studies of Palestinian society that needed change must ultimately come from within as well as from without. The common social patterns that are described and form the basis of this book not only reveal what is limiting and injurious to Palestinian women (and men) but also what is empowering and possible. As such, Cheryl Rubenberg's book is a welcome and much needed contribution to the discourse on Palestinian women and to understanding the larger conflict in which they and their families find themselves embroiled.

Mao's War Against Nature: Politics and the Environment in Revolutionary China By Judith Shapiro. Cambridge: Cambridge University Press, 2001. 287p. \$59.95 cloth, \$18.95 paper.

David Bachman, University of Washington

Judith Shapiro has written the first overview of environmental history of the People's Republic of China under Mao Zedong (1949–76). It is a grim history indeed. Instead of employing a more common temporal approach, Shapiro identifies four major themes leading to environmental degradation, and uses compelling case studies to illustrate those themes. The four themes are political repression and suppression of dissenting opinion; utopian urgency; dogmatic uniformity; and war preparation and forcible relocation of the population to remote areas.

The first theme of repression and its effects on the environment is exemplified by case studies concerning Beijing University President Ma Yinchu's suggestion that birth control be considered, starting in 1957, and civil engineer Huang Wanli's argument that the Sanxia Dam across the Yellow River, constructed in the 1950s, would not work. Both were persecuted for what proved to be their prophetic remarks. Shapiro argues that their cases were emblematic of state-intellectual interactions, especially after 1957, that made it almost impossible for scientific knowledge to be treated as a relevant criterion in assessing state policies.

The second theme of utopian urgency is told via the Great Leap Forward generally, several of its component campaigns, and the mass campaign to produce steel at the local level, in particular. This last campaign led to tremendous waste and extensive deforestation. The Leap also created the worst famine in the twentieth century, if not in human history.

The theme of dogmatic uniformity is told through the campaign to study (copy) the Dazhai Production Brigade—to terrace fields, to reclaim land, to transform nature so that more grain could be planted and grown. She details how this movement was put into practice through attempts to partially

fill in Dianchi Lake in Yunnan Province, near the City of Kunming. The lake's ecology was devastated by these efforts, and almost no additional grain output was obtained from the labor of hundreds of thousands.

Finally, the theme of war preparation and forcible relocation of the population discusses how, because of fear of attack by first the United States and later the Soviet Union, China moved many defense-related factories to the interior of the country in remote locations, causing widespread environmental damage. Here she highlights the Panzhihua steel mill in Sichuan Province. In the forcible relocation part of the chapter, she examines the policy of sending urban youths to live in the countryside. The attempt to grow rubber in Yunnan Province and how this destroyed tropical forests, with attendant damage or elimination of rare species of flora and fauna, are her particular entrée into connections between relocation and environmental degradation.

In her conclusion, Shapiro makes some brief comparative comments about environmental degradation in the economic history of the United States and the Soviet Union, and tries to open up the possibility of greater Chinese stewardship of China's environment. She notes, however, that China's economic reforms and dynamic economic growth over the last 20 years have severely compounded the damage inflicted during the Mao period.

The case studies are informative and well done, but while the environmental perspective sheds some new light on the nature of Mao's rule, China specialists will not find much that is terribly surprising here. Comparative public policy or environmental specialists might learn more about China and its environmental problems, but in the end, it should not come as a surprise to any thinking reader that a revolutionary regime is not likely to give much credence to rational scientific calculations, that the revolutionary regime will be impatient for success, and that it will go all out to transform all environments (social, natural, political, etc). The magnitude of China's environmental damage under Mao is a measure of how thoroughgoing the Chinese revolution attempted to be.

One could find a number of points on which to challenge or question Shapiro's interpretations. One might ask, even if China had begun birth control with Ma Yinchu's suggestions (and assuming it was voluntary), would it have made much difference to the rate of population increase? Shapiro suggests it would have, but there is no demographic model presented to buttress her argument. She states that all steel produced in 1958 was useless because it was smelted by the masses (p. 75). But in fact, more than half of all the steel produced in 1958 came from large, relatively modern mills and was used throughout China. She implies that war preparation was excessive and unnecessary, but this, as with much of the interpretation in the rest of the book, is only true in retrospect, and not during 1969, when numerous instances of conflict among Chinese and Soviet troops occurred.

This last point hints at one of my two biggest problems with the book. The normative framework she uses (sustainable development) did not exist to any significant extent for most of the period of Mao's rule. While China's treatment of its environment was particularly disastrous, it was not as if an "ideology" of environmental protection was well established in government decision making anywhere. Her work is also highly idealist in the philosophical sense, as the Ma Yinchu and Huang Wanli cases suggest. If only rational democratic discussion had taken place, disasters could have been avoided. One voice crying out in the wilderness could have made a difference. But as mentioned, she provides no evidence to show how birth control would have influenced population growth rates. In retrospect Huang was right, but many other scientists felt differently, even before extensive

political pressure was exerted on them. Would he have prevailed with free debate?

Although the dictatorial nature of the Chinese revolutionary state certainly caused many environmental catastrophes, Shapiro almost totally ignores more philosophically materialist concerns. Nowhere does she mention, for example, that about 70% of China's energy resources come from coal, or that as with any developing country, especially one deeply affected by the international balance of power, concerns about the environment will receive short shrift, while rapid economic growth will be a top priority. We are left to wonder, how much more worse off is the Chinese environment because of Mao than it would have been if China had followed an "East Asian Model" at an earlier stage? Is the Chinese situation noticeably worse than India's, with its democratic system but slower growth?

The historian of China, Mark Elvin, entitled one essay on China's environment "Three Thousand Years of Unsustainable Development" (East Asian History 6 [1993]) There has been a very long term pattern of Chinese environmental misuse and destruction (undoubtedly true elsewhere). Is it realistic to think that with the advent of mass consumption in China and faster growth rates than during the Mao period, sustainable development is likely to be attempted in China anytime soon?

Politics after Neoliberalism: Reregulation in Mexico By Richard Snyder. Cambridge: Cambridge University Press, 2001. 268p. \$60.00 cloth.

María Lorena Cook, Cornell University

Richard Snyder's well-crafted study substantiates what most political scientists suspected all along: that neoliberal reforms lead to new institutions of market governance, rather than to unregulated markets. Snyder sheds light on this understudied topic by examining the reregulation of the coffee sector by four state governments after the Mexican government dismantled the Instituto Mexicano del Café (INMECAFE), the state-owned enterprise that dominated the coffee industry during the 1970s and 1980s. By the late 1980s, when deregulation began, INMECAFE was providing production supports, price controls, and government-managed marketing channels for nearly 200 thousand small coffee producers. Most of these producers were located among the poorest states in southern Mexico.

State governments stepped into the policy arena vacated by federal authorities. Governors developed new regulatory projects for the coffee sector that were aimed at building political support coalitions in their states. Some governors attempted to do so via neocorporatist projects, ensuring that producer organizations that were political allies (and linked to the ruling PRI, the Partido Revolucionario Institucional) would benefit. Other governors launched crony capitalist projects that favored private elites. Snyder argues that in developing countries, the key to understanding this new institution building is that ambitious politicians, rather than insulated technocrats, drive reregulation.

Politicians' career ambitions and their ideological orientation ("policy repertoire"), shaped in turn by regime institutions and societal forces, determined the nature of reregulation projects they pursued. Institutional outcomes, however, depended on the way societal actors responded to these projects. Given the proper strategies and right set of conditions, grassroots producer organizations could alter the original projects in their favor. In the end, institutional outcomes were explained by the "strategic interactions between politicians and societal groups as they negotiate[d] the terms

of reregulation" (p. 14). How small producers managed or failed to negotiate favorable terms is at the core of the author's inquiry.

Snyder shows how in each of four states, strategic interactions among local elites, grassroots producers' associations, state governors, and federal officials led to markedly different institutional outcomes. He divides these reregulatory results into two categories: "participatory" (the states of Oaxaca and Chiapas) and "exclusionary" (Guerrero and Puebla) policy frameworks. Exclusionary policy frameworks generated monopoly rents for private elites, whereas participatory policy frameworks involved the creation of inclusive institutions that helped small producers compete in export markets.

In Oaxaca, strong producer organizations pursued an "engaged productivist" strategy and were able to negotiate with a "statist" governor to create a participatory policy framework. Participatory institutions also emerged eventually in Chiapas, where the 1994 Zapatista uprising ended a stalemate between the governor and peasant coffee organizations by enabling an alliance between grassroots producers and federal officials that neutralized the local coffee oligarchy. In Guerrero, strong grassroots producer organizations became embroiled in electoral conflicts, rather than in pushing producer interests. This led to an exclusionary policy framework fashioned by a "neoliberal" state governor. Finally, an exclusionary outcome obtained in Puebla, where a weak producers' movement faced a strong state governor and powerful oligarchy.

Snyder has produced an ambitious book, one that depicts the complex political interactions taking place in four regions of Mexico, while laying out an agenda for the study of "politics after neoliberalism." His subnational comparison of reregulation efforts within a single sector effectively supports his argument about the central role of politicians in the creation of new economic institutions. His research also provides a framework for analyzing cases in other sectors or countries where new rules for market governance are being shaped.

I found the author's discussion of producer strategies more problematic. Snyder claims that Oaxacan producer organizations pursued an "engaged productivist" strategy rather than a "partisan" strategy, thus enabling the creation of participatory frameworks. In Guerrero, by contrast, producer organizations pursued a partisan strategy, emphasizing political party opposition over productivist goals, which contributed to a reregulation project that failed to include or benefit small producers. Since Snyder is concerned with the conditions that enable the creation of participatory institutions, he appears to ascribe greater value to the former, "nonpartisan" strategy. Yet whether or not producer organizations were able to negotiate with state governors depended, among other things, on whether they signed on to newspaper ads in support of PRI presidential candidate Carlos Salinas prior to the 1988 elections. Organizations that chose to do so were rewarded with funds under PRONASOL (Programa Nacional de Solidaridad), a federal agency that funded antipoverty and development projects during the Salinas administration. Those organizations that did not sign the ads and that continued to support the left opposition PRD (Partido de la Revolución Democrática) were punished.

What Snyder implies was a more effective choice of strategy, therefore, was really a willingness to forfeit broader political aims for narrower group interests. The Salinas administration lured many popular organizations away from the political opposition with funds and other forms of support, arguably delaying political democracy even longer. Whether an engaged productivist strategy would have yielded similar results in another political context, one in which competitive electoral politics rather than political authoritarianism dominated, remains unanswered given the time frame of Snyder's

study, which ends in 1996, four years before the defeat of the PRI in the presidential elections.

As Snyder puts it, "one of the costs of choosing to be a democrat first, and a producer second, may be forfeiting the opportunity to build economic institutions that could help improve welfare and competitiveness" (p. 203). But Snyder devotes less attention to the costs of choosing to be a producer first, and a democrat second, in an authoritarian or semidemocratic regime undergoing political as well as economic transition.

This is an important book that deserves to be read by students of comparative political economy and Latin American and Mexican politics. Snyder has shown that politics remains central to understanding institution building in the wake of neoliberal reforms. The pessimistic lesson is that in the case of political decentralization, grassroots groups may become even more disadvantaged as the importance of national allies fades and they "struggl[e] alone against the exploitative designs of insurgent oligarchs" (p. 192). But his study also provides some cause for optimism. As long as politics matters, grassroots groups may shape their own future, even if they may not shape it under circumstances of their own choosing.

The Politics of the Spirit: The Political Implications of Pentecostalized Religion in Costa Rica and Guatemala By Timothy J. Steigenga. Lanham, MD: Lexington Books, 2001. 220p. \$70.00 cloth, \$24.95 paper.

Virginia Garrard-Burnett, University of Texas, Austin

The Politics of the Spirit is Timothy Steigenga's long-awaited quantitative study of religious affiliation and political behavior in Central America. What he has done in this spare and conscientious study is to take to task the "conventional wisdom" about Protestantism in Central America. This is a formidable endeavor, given the flood of scholarly literature that has been produced by anthropologists, historians, and sociologists about Protestantism, and especially Pentecostalism, in Latin America over the past two decades. Because Pentecostalism seemed to emerge in Central America during the region's political crisis of the late twentieth century, much of this literature carried with it a highly deterministic subtext, defined by Max Weber and by models of political behavior borrowed from the United States and European experiences.

În general, much of the existing work on political behavior and religious affiliation in Latin America and in Central America in particular has been idiosyncratic, anecdotal, intuitive (if often based on sound intuition), and contradictory. In this study, Steigenga takes the central but fuzzy precepts laid out by this earlier work and tests them in two cases, Guatemala and Costa Rica. His findings, based on surveys, interviews, and statistical analysis are so surprising and so persuasive that they force us to reconsider whether our conventions on this topic contained any wisdom at all.

There are two overarching hypotheses that drive this study. The first is that in Central America, Protestants (whom Steigenga differentiates throughout as Mainstream Protestants, Pentecostals, and Sects—a potentially problematic term that he uses to refer to such groups as Mormons, Jehovah's Witnesses, and Adventists) make up a political monolith, whose theological conservatism and religious affiliation translates into political quiescence at best and blind obedience to oppressive governments at worst. This hypothesis lies at the heart of Steigenga's study of Guatemala, where repressive government, 36 years of civil war, and a virulent counterinsurgency led briefly by the Pentecostal general,

Efrain Ríos Montt, would seem to offer a transparent example of the confluence of evangelical religious affiliation and political conservatism. Costa Rica, by contrast, which has a smaller Protestant population but a long-standing democratic tradition, would have seemed to offer a test case of whether Central American Protestants are more likely to be political and progressive in a more open society. The second operative hypothesis for this study is the Weberian equation of Protestantism and capitalism, recently updated by Amy Sherman, who argues in her 1997 work on Guatemala (*The Soul of Development: Biblical Christianity and Economic Transformation in Guatemala*) that Protestants can be shown to have adopted new patterns of thinking, which are demonstrably conducive to socioeconomic advancement that also enhances the development of democracy.

In his careful analysis, Steigenga unpacks these hypotheses element by element. His overall conclusion is that evangelicals, taken as a group (something he wisely advises us not to do), do indeed have a strong tendency to respect political authority, but that respect is present regardless of a given government's political context. In a series of surveys, which examine religious conservatism, political conservatism, and political affiliation, Steigenga is not able to identify any single pattern to support the notion that religious affiliation is the determinant of conservative political behavior in Central America, in either Guatemala or Costa Rica. What he does find, however, is that certain types of religious behavior (as opposed to affiliation) can drive political behavior.

In addition, he finds no evidence of the prosperity-enhancing behaviors described by Sherman (except among Guatemalan Neopentecostals, for whom material prosperity is theologically mandated). What Steigenga finds instead is what he describes as a "change in perception of economic status" [emphasis mine] (p. 42). While Protestants are not distinguishable from Catholics by any quantifiable economic measure, Protestants nonetheless typically perceive a causal relationship between religious affiliation and economic advancement, thus giving some credence to Anthony Gill ("The Economics of Evangelization," in Paul Sigmund, ed., Religious Freedom and Evangelization in Latin America, 1999) and others who advocate the rational economic model for religious change in Latin America.

For this reviewer, however, the real treasures in this little jewel box of a book are the secondary findings. Because Steigenga conducted his research among Catholics as well as Protestants, some unexpected congruencies emerge. Perhaps the most important of these is that in Guatemala, 50% of Mainstream (non-Pentecostal) Protestants and many Catholics perceive that they have experienced glossolalia (speaking in tongues), the defining experience of Pentecostalism, or some other miraculous manifestation of the Holy Spirit. The most common of these was miraculous healing, an event that no less that 71% of Guatemala Catholics report having experienced (pp. 45, 82). This revelation leads Steigenga to the conclusion that religion of all kinds is becoming "Pentecostalized" in Guatemala, as it is to a lesser extent in Costa Rica (p. 46).

This Pentecostalization of religion has serious implications for the development of civil society, the author suggests, because while he finds no consistent template for voting, political affiliation, or political participation across the lines of religious affiliation, he does identify clearly definable patterns across the spectrum of religious behavior, specifically in the area of charismatic behavior. The surprising evidence here suggests that charismatic religious experience, regardless of whether it is in a Pentecostal, Mainstream Protestant, or Catholic context, is a significant predicator of political variables in both Guatemala and Costa Rica. In Steigenga's

words, "the experience of speaking in tongues appears to be associated with higher levels of political quiescence" (p. 93). The reason for this is not entirely clear, although he indicates that it may have to do with the inward focus of charismatic behavior, which is likely to negatively impact voluntarism or involvement in political or other nonreligious social movements. But in these matters, denominational lines blur, for, as Steigenga notes, "charismatic Protestants may have more in common politically with charismatic Catholics than they do with other Protestants" (p. 93).

Another unexpected finding in this study is the apparent relationship between Protestant biblical literalism and the empowerment of women. Although gender was tangential to the larger concerns of this book, Steigenga surveyed respondents on their views of women's participation in the domestic and public spheres as a variable in his surveys on theological conservatism. While the work of Elizabeth Brusco (The Reformation of Machismo: Evangelical Conversion and Gender in Colombia, 1995) and others has suggested a causal relationship between women's membership in evangelical churches and the "reformation of machismo," the conventional wisdom heretofore was that Latin evangelical women nonetheless model themselves after the subservient "virtuous woman," the ideal type for many North American fundamentalists. In this study, Steigenga discovered an entirely different set of attitudes, based not only on behavior, but upon theology: Both doctrinally conservative Protestant and Catholics were likely to see gender equity, not subservience, as an ideal type. In the too-short chapter he devotes to gender, the author concludes that "measures of doctrinal orthodoxy are excellent predictors of positive attitudes toward gender equity across religious groups and across genders" (p. 132).

Clearly, Steigenga's work leads us to the juncture of important future studies. Its provocative and meticulous conclusions, laid out cleanly without rhetorical flourishes or overreaching analysis, suggests exciting new venues for research in ecumenical political behavior, gender analysis, and religious behavior in civil society. There may be scholars in the field who will disagree with his conclusions but who will also find it impossible to ignore them.

The Politics of Freeing Markets in Latin America: Chile, Argentina, and Mexico By Judith A. Teichman. Chapel Hill: University of North Carolina Press, 2001. 288p. \$55.00 cloth, \$19.95 paper.

Peter Kingstone, University of Connecticut

The politics of neoliberal reform in Latin America has produced a number of impressions that are more or less widely held, but not necessarily entirely accurate. For example, many critics of the neoliberal reform process see it as a creature of Washington and Wall Street-views of economic development imposed on vulnerable, debt-ridden Latin American governments. The International Monetary Fund (IMF) and the World Bank play crucial roles as carriers of the "Washington Consensus" and enforcers of its policy prescriptions. In this view, insulated technocrats—often with U.S. economics degrees—implement these essentially unpopular programs without consultation, oversight, or any societal participation. "Delegative democracy" and populations battered by a decade or more of debt and inflation help explain the extent to which these unelected and unaccountable technocrats have been able to promote this agenda. A narrow electoral coalition, anchored by wealth holders and conservative ideologues, has maintained the political space for these insulated technocrats to continue, despite deep opposition from societal groups such as labor.

In her new book, Judith Teichman does not dispute these characterizations. Rather, she notes that there are several aspects of neoliberal reform that are not fully addressed. First, as several scholars, such as Eduardo Silva for example, have shown, the image of technocrats working in isolation is not an accurate portrayal. Although technocrats did not consult widely, privileged members of the coalition, such as domestic business groups, played an important role in shaping economic policy. Second, this common "coalition" approach does not fully answer questions about why the pace and sequence of reforms vary among Latin American reformers. Examining the reform process in terms of coalitions makes it hard to recognize the role of specific individuals, their ideological or programmatic beliefs, and their links to specific groups in society. The failure to examine these individual technocrats and the alliances they form makes it hard to understand why some reforms advance quickly and substantially in one country, but lag in another. In other words, the coalition approach sheds little light on the political calculations in specific policy areas (pp. 15-16).

As an alternative to the coalition approach, Teichman instead imports the concept of a "policy network" from the literature on the developed world to the Latin American context. The differences in the Latin American context, however, mean that Teichman must adapt the concept in order to make it operable in the less democratic Latin American environment. Perhaps most importantly, policy networks in Latin America are not pluralistic and do not offer a wide array of societal groups any opportunities to influence policy. Policy networks in Latin America depend substantially on personal trust and loyalty instead of common interests, combine both personalistic and highly discretionary power with institutional sources of power, and form among individuals with formal positions and those without any formal office (p. 14). As a result, these networks persist even when specific individuals leave office. Policy networks in Latin America differ as well because they incorporate international actors, most importantly members of the World Bank. Finally, policy networks in Latin America appear to be important mobilizers of policy reform, in contrast to the United States or Britain where they are perceived as obstacles to change (p. 15).

Teichman uses this modified concept to great effect in examining the politics of market reform in Argentina, Chile, and Mexico. The book does an admirable job of tracing the rising influence of key technocrats in the three countries. In each case, she successfully tracks the connections that form among these technocrats (often drawn from academia), representatives of international agencies (particularly the World Bank), and leading figures in the business community. The approach allows her to illustrate how ideas about reform developed in dialogue between the bank and the technocrats. Teichman's analysis shows how the flexibility and intimacy of World Bank officials in dealing with national policymakers fostered cooperation and learning, and facilitated the building of strategic alliances between bank and national officials and between national officials and domestic industrialists. In fact, the more distant and doctrinaire IMF officials wielded less influence than the more pragmatic World Bank. Thus, her analysis provides a nuanced alternative to the widely held view of neoliberal reform as an imposition from abroad. It also shows that the relationship between policy reformers and domestic industrialists was also more nuanced than often believed. Technocrats were neither agents of powerful economic interests nor entirely independent of business and thus able and willing to impose reforms on unsympathetic but impotent industrialists. Instead, industrialists and technocrats were involved in a genuine exchange: Industrialists

defended specific interests with some success in modifying policies; technocrats actively worked to teach, inform, and persuade industrialists, often successfully, of the merits of particular policy choices.

Teichman's modified policy network concept is a valuable and promising instrument for examining the nuances of policy deliberation and implementation in Latin America. In fact, the policy networks approach could have been pushed further. The author provides a good accounting of the general reform program in the three countries, but she does not examine any particular policy area in greater depth. The policy network concept seems particularly well suited for exploring the character of specific policies at a more detailed level and for helping account for variations in policy design from case to case. All three cases pursued trade liberalization, for example, but the design of the reform varies among the three, and it would have been helpful to see the policy network concept applied at that level of detail.

The book offers an additional benefit beyond the introduction and application of the modified policy network concept. It is an excellent book for teaching purposes, with a good balance between background, historical review, and analytical discussion. Overall, this is a valuable contribution to the study of economic reform in Latin America.

**The Tories and Europe** By John Turner. Manchester: Manchester University Press, 2001. 282p. \$29.95.

Samuel H. Beer, Harvard University

In this thoroughly researched, well-organized, and clearly written work, John Turner raises important questions of comparative politics. The book is packed with facts and informed by ideas. You may well disagree with his conclusions, as I do. But you must give him credit for the seriousness of his concerns and his willingness to present the evidence, even though it can sometimes be used to support a different interpretation. "Over the past forty years," he writes, when stating his central conclusion, "Europe has transformed the nature of British politics and Tory politics in particular" (p. 1). Contrary to a view common among political scientists that foreign policy normally has far less influence on electoral behavior than on domestic policy, he finds that Britain's relation to European integration has "gradually...moved to the heart of the domestic political agenda" (p. 1), radically altering the balance of power between the two main parties. As the Euroskeptical champions of national independence, the Conservatives have become "increasingly beleaguered over the issue," thereby making it possible for Labour "to use Europe as a way of revitalizing the party's programme and image" (p. 2). He clearly would like to see terminal decline for the Conservatives and continued success for a social democratic Britain in a similarly collectivist Europe.

Turner is certainly right when he claims that the question of Europe has so severely divided the Conservatives as to prevent them from governing effectively and winning elections. The causal connection between the European issue and these weaknesses, however, is not what he takes it to be. From Margaret Thatcher's anti-European tirade at Bruges in 1988, the issue did with increasing bitterness divide the party leadership and the parliamentary party. This made it ever more difficult to govern the country, as John Major found, for example, in his prolonged effort in 1992–93 to win parliamentary approval of the Maastricht Treaty establishing the European Union. It was not, however, the voter's disagreement with the party's Euroskepticism that led to its steep, continuing decline in the polls and to defeat in the general elections of 1997 and 2001. Actually, this decisive shift in the balance of

power, as Turner himself reports, dates from the economic crisis brought on by the Conservative government's move toward monetary union by adoption of the exchange rate mechanism. This humiliating failure deprived the Conservatives of their long-standing reputation as the party best able to manage the economy, opening up the huge gap behind Labour in the polls that has persisted to the present day.

While this failure strengthened Conservative Euroskepticism, that did the party no great harm among the voters. On the contrary, as Turner grants, they had long been of that mind. A survey done just before the 2001 election showed a preference for the Conservative position on Europe over Labour's of 44% to 28% (Robert Worcester and Roger Mortimer, Explaining Labour's Second Landslide, 2001, p. 29). The same survey, however, also reported the low salience of the issue. As an important reason for their choice, voters ranked Europe far below the familiar issues of a modern welfare state, health, education, pensions, the economy, unemployment and transport, with regard to all of which, and in that order, respondents greatly preferred Labour. The conventional wisdom is right. Domestic policy trumps foreign policy as an influence on electoral behavior.

The contests in which Europe has figured as an important influence have been the elections to the party leadership. This fierce quarrel within the Conservative elite had a decisive influence on public policy toward Europe, but contrary to Turner's view, it was peripheral to the transformation of British politics that took place during the Thatcher-Blair era. With a focus on domestic affairs, the essence of the change was the neoliberal break instigated by Margaret Thatcher from the post-war collectivist consensus. The significance of this break for Britain and the Conservatives appears if one looks back to the 1960s when the government of Harold Macmillan enthusiastically embraced and expanded the welfare state and managed economy introduced by Labour. In effect, Macmillan was reaffirming what he had said some years before, that "Toryism has always been a form of paternal Socialism" (The Star, London, June 25, 1936). R. A. Butler had also called on this brand of Toryism when he led the Conservatives into the convergence with Labour's achievement, which made the party once more electable and which has been denominated "Butskellism." Turner seems totally unaware of this Tory tradition, whose power and history bring out the radical contrast of the boldly ideological innovations of Thatcher, who contemptuously dismissed its adherents as "the wets."

Conducting his own purge by eliminating socialism in all but the name from New Labour's program, Tony Blair reinvigorated his party by accepting all the basic Thatcherite reforms, denationalization, fiscal prudence, and reduction of trade union privileges, and in some respects, such as his workfare reforms, going beyond what she had attempted. To this display of convergence to the Right rather than the Left, which may be called "Blatcherism," he added certain more generous provisions of social policy, justifying his claim to champion a Third Way. Toward Europe he did take a more positive approach, accepting, for example, the Maastricht Social Charter. Few of its provisions, however, were enacted into British law, and with regard to monetary union, the practical effect of his five criteria in delaying acceptance is much the same as John Major's "wait and see" position.

As for the future, a long view of the past must qualify any inference that the two landslide defeats spell terminal decline for the Conservatives. That party is the phoenix of British politics, having from its origins as the Tories of the seventeenth century suffered repeated defeat on behalf of such causes as divine right, aristocratic privilege, and protectionism, only pragmatically to recover as the party of government. Today it is excluded from power by the Europhobic obsession of its dominant faction. If Europe advances into a prosperous and secure future, uniting not only its elites but also its peoples, the Tories once again will be obliged to adapt. On the other hand, now that the pressure for cooperation exerted by the Cold War has slackened and the new fear of Islamic terrorism is tightening control of national borders, the old rivalries among these nation-states may revive. If so, Europe, stabilized in its restricted but still remarkable achievement as a customs union, will fulfill the Thatcherite prescription, obliging the more visionary Conservative Europhiles to make a corresponding adjustment.

### **International Relations**

Identities, Border, Orders: Rethinking International Relations Theory Edited by Mathias Albert, David Jacobson, and Yosef Lapid. Minneapolis: University of Minnestota Press, 2001. 328p. \$57.95 cloth, \$22.95 paper.

Bridges and Boundaries: Historians, Political Scientists, and the Study of International Relations Edited by Colin Elman and Miriam Fendius Elman. Cambridge, MA: MIT Press, 2001. 431p. \$50.00 cloth, \$24.95 paper.

Nicholas Onuf, Florida International University

The editors of *Bridges and Boundaries* asked contributors—nine political scientists and eight historians, all of them North American—to reflect on their respective disciplines and the way they go about "the study of international events" (p. 1). We should notice a positivist disposition here. While contributors "share an interest... in the state, politics and war" (p. 2), events are the stuff of international relations. That the state, politics, and war are complex institutional phenomena perhaps not reducible to events points to conceptual issues that this volume fails generally to address. Instead, contributors discuss the many problems attending generalized explanation

and empirical fit—theory and science—as if their shared interests imply a common stock of core concepts.

Given that most of the contributors are political realists, this assumption is no doubt well taken. Whether the concepts in question suit the needs of good theory, good science, or good history of international relations is another matter, and never considered. According to the editors, what does matter are differences in the conceptualization of events: "Whereas historians focus on 'human conduct,' political scientists analyze 'behavior'" (p. 23). Yet human behavior is often and perhaps always intentional, while unintended consequences are often events not behavioral in any sense. What the editors, as political scientists, have to say on this subject is confusing, and their contributors offer little help.

Part I consists of essays by Jack Levy, Stephen Pelz, Ned Lebow, and Andrew Bennett and Alexander George, on disciplinary practices and methodological issues. Most of this material is familiar enough, not least because it carries on a discussion initiated in *International Security 22* (Summer 1997). Part II provides a series of topical contexts by which to evaluate good practices in the two disciplines. First, Gerhard Weinberg's and Randall Schweller's relatively brief essays on the origins of World War II are juxtaposed for Carole Fink's

rather tentative adjudication. If this debate seems somewhat contrived, the next one, featuring substantial essays by Edward Ingram and William Thompson on British hegemony in the nineteenth century, is far more engaging.

With impressive command of relevant materials, the imperial historian and long-cycle theorist state their cases vigorously, while deftly exposing the other's weaknesses. Richard Rosecrance's postscript adds some perspective to the debate. By comparison, the three essays on the Cold War are rather disappointing. John Gaddis is all over the place. If his piece gives the distinct impression of being tossed off, Deborah Larson's rather pedantic discussion of sources in Cold War scholarship seems like a school exercise. Given so little to work with, William Wohlforth has little to contribute in his postscript. Finally, John Lynn's absorbing discussion of innovation and diffusion in the technology and organization of military affairs over several centuries stands by itself—rather oddly, since the rest of Part II uses debate as a format.

The two essays making up Part III, Conclusions, give the book a strong finish. Political scientist Robert Jervis picks up on three running themes. Positivist political scientists value parsimony and theory building more than historians do, while historians are more sensitive to moral concerns. Lacking theory, parsimony is out of the question; everything matters. If theory building means raising the level of abstraction in order to leave out what matters less, historians fear leaving out the wrong things. Acts of omission have ethical implications. Jervis suspects that political scientists tend to avoid the affective dimension of human affairs. Yet there is more to it than this. Issues of agency, intentionality, and normativity seem to make them uncomfortable.

Historian Paul Schroeder has a short reply to Jervis and his colleagues: "Yes, but" (p. 403). Schroeder argues that "history as actually practiced and presented by good professional historians is full of parsimonious explanation, if not theory" (p. 405). If no theory, then we must ask how the good historian knows what to leave out and how to organize what remains; narrative conventions hardly suffice. Indeed, the standards of good history remain as inscrutable as ever.

Schroeder does have quite a bit to say about moral judgment. He concludes that because historians tend to treat human actions as conduct, and political scientists treat it as behavior, historians are less disposed to ignore moral considerations. Yet this is too simple. Good historians often enough translate actions into events, not conduct. When they do so, they deploy an abstracting device that promotes neither parsimony nor moral self-awareness. Positivists know what to do with events. No contributor to this volume clarifies sufficiently the concept of *conduct*, and with it the relation of intention, judgment, and action, for any of us to put this concept to good

Metaphorical flourishes betray the conceptual limitations of *Bridges and Boundaries*. We might just as well position its contributors in a swampy zone at the distant margins of two disciplines. Neither ranchers and farmers (Lebow) nor martians and venusians (Thompson), they are back-country folk trucking and feuding with each other from time immemorial. Ancient tracks crisscrossing their landscape defy all boundaries; bridges and fords are everywhere but go nowhere. When offered a way out to the glittering city of social theory, with its Parisian fashions and multicultural sensibilities, these are the people who stay behind.

In these terms, *Identities, Borders and Orders* could not be more different. Its 15 contributors include political scientists, sociologists, and a geographer; several are European. They are participants in a "conceptually innovative" research project "operating against a background of North Americanstyle International Relations" (p. vii). The contributors

variously draw on postpositivist social theory and normative theory—they are metaphorical migrants who have come to the city and love its ways. In their essays, we find no disciplinary nostalgia or defensiveness, and thus no calls for bridge—building. Their project follows an earlier volume, *The Return of Culture and Identity in IR Theory* (Yosef Lapid and Friedrich Kratochwil, eds., 1996), this time adding an explicit conceptual map for getting around the city.

Lapid sketches the map in his Introduction to the new volume. It identifies three sites for conceptual development—identities, borders, and orders—but always in relation to one another. Never fixed destinations, these linked points of reference constitute the "IBO triad" as inextricably related processes. Just as "the road to a processual-relational understanding of international relations will inevitably take us through the IB intersection" (p. 11), it will also take us through the IO and BO intersections. Of course, no single trip need go through all three intersections and, we might guess, each trip changes the map's details for the next adventurer.

Lapid's Introduction is too brief to provide an adequate conceptual orientation for city visitors. For the most part, contributors talk about identity (as a process) as if its relation to agency (as a condition) needs no additional clarification. The same may be said of order (as a process) in relation to structure (as a condition). Against this tendency are conceptually important discussions of the process of bordering in relation to identity and order. Nevertheless, the conceptual attention to borders has the perverse effect of turning the triad into a teeterboard whose fulcrum is bordering. At one end of the board are the essays of the book's Part I assessing an ever-shifting international order. At the other end are the essays in Part II for which issues of identity are paramount. These loads are unbalanced; the second part is less substantial than the first, perhaps because the latter draws upon the centuries' longer discussion of order (as a condition) in political and international theory.

The first three essays in Part I, by Mathias Albert and Lothar Brock, Richard Mansbach and Franke Wilmer, and Ronnie Lipschutz, intersect at many points in tracing the rise of "Westphalian" modernity. Their shared concern with normative properties of the modern world stands in marked contrast to the epic stories in *Bridges and Boundaries*. Didier Bigo's interesting discussion of the vanishing border between internal and external security emphasizes agents and their practices. Chris Brown examines liberal versions of cosmopolitan and communitarian polarities in what he might have called republican theory. As a geographer, David Newman helpfully reviews the way geographers think about borders.

David Jacobson leads off Part II with an essay on formal norms and global culture. Antje Wiener assesses the place of democratic practices in the "new medievalism"—a trope of Hedley Bull's certain to bemuse any good historian (cf. Brown, p. 233). Both Rey Koslowski and Martin Heisler consider migration and identity, respectively emphasizing dual nationality and citizenship. Neil Harvey could dispense with a formulaic use of Jacques Derrida in reviewing the Zapatista uprising.

Mathias Albert and Kratochwil structure their conclusion to the volume with a suggestive discussion of conceptual fuzziness. If processes are to be understood as changing sets of relations, as they assert, then fuzziness can be avoided if we turn our conceptual attention from objects to "activities" (p. 280; their emphasis). Despite this sensible claim, they invoke Niklas Luhmann's theory of society to uncover "a whole world of codes and evolutionary-communicative dynamics of world society, which work behind the intentions of the actors" (p. 288). Not only does the phrase "work behind" offer a

regrettable example of fuzzy conceptualization; Albert and Kratochwil seem to separate intentions and activities so radically that agency disappears from their conceptual world. If this is their intention, it is a gratuitous exercise in bordering, and one that works against the editors' stated intentions for this ambitious book.

Democracy, Liberalism, and War: Rethinking the Democratic Peace Debate Edited by Tarak Barkawi and Mark Laffey. Boulder, CO: Lynne Rienner, 2001. 250p. \$52.00.

David Dessler, College of William and Mary

The essays in this ambitious volume take as their foil the democratic peace hypothesis: the claim that liberal democracies, while still going to war against nonliberal states, rarely wage war on one another. "This volume challenges the received international wisdom about democracy, liberalism, and war," write the editors in the Introduction. "The democratic peace, with its transhistorical causal law based on fixed definitions of democracy and war and a nation-state ontology of the international, is far too simplistic a frame from which to analyze the various historical and contemporary configurations of democracy, liberalism, and war" (p. 2).

The point of the book is not to refute the democratic peace hypothesis but to broaden the debate it has engendered. Several contributors examine the ways in which liberal democracy might be more of a problem than a solution in today's world. David Blaney argues that while liberal polities create a space for pluralism of a certain kind, they are also exclusionary in endorsing only those identities consistent with liberal norms. This "liberal fundamentalism," Blaney asserts, may explain why liberal states are warlike in their relations with nonliberal states. Himadeep Muppidi focuses on the relationship between democracy and state identity, suggesting in an analysis of India's relations with Pakistan and Sri Lanka that democracy did nothing to prevent conflict and war in these cases (and, in the case of Sri Lanka, may have actually helped give rise to war). Timothy Kubik claims that the military in modern liberal states is an independent actor that can influence and even work its way around the domestic normative constraints that are supposed to ensure the democratic peace. And Mark Rupert considers the ways in which democratic rule can be deformed by concentrations of private power grounded in relations between economic classes.

Other authors highlight the benefits of historicizing the concepts of "democracy" and "war" and moving beyond a narrow state-centric understanding of the relationship between them. Michael Mann maintains that in cases of colonial conflict (rather than interstate war), Western liberal regimes waged war against indigenous populations that were usually more democratic than they were. Tarak Barkawi assesses U.S. foreign policy in the Third World during the Cold War and notes that the wars the United States fought there do not fit into the analytic categories the democratic peace hypothesis provides. An adequate understanding of the relationship between democracy and war during the Cold War can be gained, Barkawi argues, only by shifting away from a purely statecentric theoretical framework. Bruce Cumings examines the origins of democracy in Japan, South Korea, and Taiwan and concludes that we cannot understand these histories without examining transnational systems and hierachies of power that theorists of the democratic peace have ignored. And Martin Shaw sketches a historical and sociological approach to the problem of war and democracy that challenges the division of the world into distinct domestic and international spheres, suggesting that national states and societies cannot be treated as given structures in the global political order.

The volume largely succeeds in bringing the conventional debate about the democratic peace into question. The essays maintain a high scholarly standard, and they hang together much better than the contributions to most edited volumes do. They also strike a good balance between theory development and the introduction of new empirical material to the literature on democracy and war. This book will be indispensable reading for anyone interested in the full implications of the democratic peace debate.

The main weakness of the volume may be the tendency of some contributors to suggest they are challenging not only the conventional debate over the democratic peace but also conventional forms of social inquiry as well. In the book's concluding chapter, Raymond Duvall and Jutta Weldes argue that the essays in this volume reject "the logic of explanation employed by analysts of the democratic peace," which they characterize as "reductionist and causal" (p. 200). The alternative developed in this volume, Duvall and Weldes maintain, amounts to "the radical alternative of seeing [the democratic peace] as a historically contingent, systematic condition" (p. 200). But none of the substantive arguments in the book requires or entails a break with ordinary social science. The authors neither advance a new epistemology nor suggest new methods of social analysis. The novelty of their essays consists in the new theoretical and empirical ground they break, not in a new logic of explanation. What does democracy look like in India, and how does it shape India's relations with its neighbors? What role did democracy play in the colonial experiences of Western powers? How did U.S. policy in Asia during and after the Cold War shape the democracies that emerged in Japan, South Korea, and Taiwan? The contributors to this volume argue convincingly that the answers to these and similar causal questions are crucial to an adequate understanding of the international relations of democracy, liberalism, and war. They do not show that we need new techniques of social inquiry to historicize and contextualize our understanding of democracy and war.

In conclusion, it is worth emphasizing that, as noted, the aim of this volume is not to show that the democratic peace hypothesis ("democratic states rarely fight one another") is false. Indeed, several contributors state flatly that they recognize the truth in this claim. Their concern is not to question the validity of the democratic peace hypothesis but its significance. If there is a main overall message of the volume, it is this: The democratic peace hypothesis obscures more than it reveals about the complex interrelations among democracy, liberalism, and war. It is not the hypothesis per se, but the monopoly it has enjoyed in academic and policy debate, that needs to be confronted. If we want to understand more fully how democracy, liberalism, and war are connected, the contributors to this volume are saying, we need research that is more theoretically ambitious and historically sensitive than most work on the topic has been to date.

**Rethinking Europe's Future** By David P. Calleo. Princeton: Princeton University Press, 2001. 381p. \$24.95.

From the Nation State to Europe?: Essays in Honor of Jack Hayward Edited by Anand Menon and Vincent Wright. Oxford: Oxford University Press, 2001. 261p. \$65.00 cloth, \$24.95 paper.

Francesco Duina, Bates College

Rethinking Europe's Future and From the Nation State to Europe? belong to two different genres of European studies. From the Nation State to Europe? is a collection of academic essays about the transformation of the nation-state in the European Union's context and its implications for social

scientific theoretical concepts. Rethinking Europe's Future is by contrast aimed at politicians and policymakers. Its major objective is to discourage policies designed to push Europe and NATO to expand eastward, perhaps to embrace Russia, and instead to encourage Western Europe to assert itself as a major independent, even if not fully united, force in the world. Despite this disciplinary difference, however, the two books complement each other well. The former is about the present state of affairs in Europe; the latter concerns the future and, for that purpose, a good deal of the past. Both involve excellent scholarship and thoughtful arguments, though organizationally they share some weaknesses. They should prove interesting to any student of European affairs.

The essays in From the Nation State to Europe are dedicated to Jack Hayward, a prominent scholar of Europe from the University of Oxford. In line with Hayward's interests and recent trends in European studies, the authors skirt the "rather sterile debates" between intergovernmentalists and neofunctionalists over the drivers of integration (p. 99). They focus instead on three topics: the impact of integration on the nation-state, the appropriateness of using theories of national politics to study the European Union (EU), and the implications of the observed changes for existing theories of national politics. In addressing these topics, the authors do not intend to be comprehensive. Rather, they aim to be selective and incisive.

The transformation of the nation-state is investigated from a number of interesting perspectives. Monetary union, Elie Cohen points out, has introduced great structural and cultural changes in the political landscape of France. With monetary policy no longer controlled by a central bank that is dependent on national politics, the strategies and discourse of French politicians have altered dramatically. Yves Mény expands on Cohen's point to note that in a great number of areas besides monetary policy, we can observe a transfer of power from nation-states to Brussels. The transfer has especially affected the legal sphere. Yet the transfer has few precedents in history: It has not been accompanied by a Europeanization of administrative structures (in the sense of centralization at the European level). Nation-states in Europe lack legal authority but retain administrative clout. The implications of this situation for the organization and strategies of interest groups are discussed (p. 40). The next two chapters return to France. Both Pierre Grémion and Stanley Hoffman explore the tensions between the traditional interventionist role of the French state and the European project. "Not only," Grémion argues, "did the removal of trade barriers inhibit the state's proactive role, but the philosophy that underlay this new Europe was derived from the German social market economy, which was unknown in and alien to France" (p. 49). Predictably, such tensions have affected national political parties, both in France and elsewhere. Hence, the section concludes with an examination by Hugh Berrington and Rod Hague of British political parties and their relationship to educational and class groupings.

If the preceding chapters implicitly recognize the growing political stature of the EU, the chapters in the next section investigate whether the EU may in fact be examined with the conceptual tools traditionally deployed in the study of nation-states. "Does the EU," the authors ask, "defy attempts at comparison with national politics?" (p. 5). The evidence seems to suggest that it does. In the case of policymaking, Jeremy Richardson argues, the EU has no parallels with the nation-state. Political parties play a minor role in Brussels, and the Council of Ministers "is more a site for disputation and resolution of radically different policy programmes and ideologies than an institution trying to introduce and implement a more or less recognizable *programme* of public policy"

(p. 98). The mass media are largely absent from the scene, and interest groups do not attempt to manipulate media officials to their own ends. David Hine arrives at a similar conclusion when investigating whether treaty revisions in the EU's history may be said to resemble constitutional reform in nationstates. It is interesting to note that the comparison is executed along three dimensions: substance, context or justification, and operating procedures. Only with regard to substance (i.e., whether similar issues of governance are at stake) do parallels exist. Otherwise, differences abound. Edward Page further emphasizes the differences between the EU and nation-states when he demonstrates that the legal and bureaucratic structures of the EU are fairly fragmented and reliant on outside groups and various internal institutions to produce laws. They are altogether different from the typically hierarchical national structures. Even in the realm of monetary policy, the EU escapes direct comparison. Economic models used to explain the benefits of independent central banks seem not to apply to the EU, as James Forder points out.

As Menon notes, the third section of the book examines whether "any substantive effect that the EU may have had on its member states has potential implications for the way in which we study national politics" (p. 6). Do concepts, such as sovereignty, national identity, governance, and class struggle still apply to European nation-states? The authors lack consensus on this topic. Bruno Jobert argues that states have lost their cohesiveness as political agents. They have become "interacting states," permanently in transaction with one another and various supranational centers of power, and behaving in line with internalized norms and expectations that exist at the international level (p. 192). Colin Crouch seems more ambivalent. He points to the transformation of nationalist managerial and capitalist classes into transnational groups, but he notes that labor remains still rooted in national politics. Peter Hall argues outright that states retain their uniqueness and features. Integration imposes similar pressures on nation-states; however, he notes, "nations are endowed with distinctive sets of institutions, embodying strengths as well as weaknesses, which make it feasible for them to pursue multiple adjustment strategies in the face of common problems" (p. 235).

A concluding chapter is missing, but this is partly explained by the passing away of Vincent Wright—its intended author. This minor flaw highlights a problem with the book common to edited volumes. At times one has to struggle to see the relevance of a given chapter for the themes at hand. Some chapters are a bit unclear, and one—Stanley Hoffman's—is incisive and promising but a bit too brief. The volume nonetheless offers a stimulating set of essays in light of interesting questions about the current state of European affairs.

If curious about the future, however, the reader would do well to turn to David P. Calleo's Rethinking Europe's Future, which offers an unusual evaluation of what the future might hold for Europe. Calleo's main message is one of caution. Western European nations, he thinks, have historically been in conflict with one another. The Cold War merely dampened such tensions by forcing European states to collaborate. The collapse of the Soviet Union has the potential to revive old tensions. The potential is real, he suggests: Five decades of dependence on American power have discouraged Europeans from taking any serious steps toward political and military unification. Current plans to expand eastward, perhaps all the way to Russia under the umbrella of NATO, would only complicate matters. Calleo argues that Europe's core is far from being solid. Moreover, Russia is in any case unlikely to join the European project in any meaningful way, while too much of a cultural, political, and economic gap separates most of the

Eastern European countries from those in Western Europe. Western Europe must establish itself as a strong, independent player in the world. This means, among other things, severing ties with the United States. "A new transatlantic relationship," Calleo notes, "will have to be found, one in which Europe will depend more on its own indigenous forces, institutions, and balances" (p. 5).

Calleo's prognosis, or perhaps prescription, for the future rests on a deep examination of the past, carried out in the first two thirds of the book. The first third offers an interesting and unusual, even if at times somewhat eclectic, review of the conflicting geopolitical and intellectual currents that shaped Europe in the twentieth century up to the Cold War. Disillusioned with American involvement in Europe after World War I, France has turned to Germany for partnership. Britain has instead had a persistent faith in the United States. World War II only served to solidify the British belief in an Atlantic partnership, while a "disillusioned [France] began exploring collaborating with Germany around a common European project" (p. 23). Underlying such differences between France and Britain are larger philosophical and theoretical threads, dating back to medieval visions of a united Europe and continuing through the Reformation, English liberalism, mercantilism, Herder, Napoleon, von Hayek, Keynes, and even communitarian nationalism. These threads generate what Calleo considers three fundamental tensions in Western European history: those between sovereign nation-states and international coexistence, those between capitalism and its self-destructive forces, and those between capitalism and

The second third of the book examines how the Cold War at once dampened these tensions and precluded the full development of a united Europe. "A divided and occupied Germany," writes Calleo at one point, "greatly eased and encouraged Franco-German contention" (p. 102). Nonetheless, it also compromised Europe's growth: "Being able to leave security to NATO under American leadership also allowed Europeans to avoid the dangerous issue of military primacy among themselves" (p. 102). When the Soviet Union unexpectedly collapsed, Europe resembled an insecure child charged with unprecedented responsibilities.

Many readers are likely to disagree with Calleo's recommendations for a strong, contained European Union. In the eyes of many politicians and academics, expansion seems desirable. Yet, most readers will surely acknowledge the merits of the book: a recommendable effort to link past and future, an unusual attention to intellectual and geopolitical currents, and a somewhat unfashionable (and therefore audacious) interpretation of the limits of enlargement. They will also identify some, primarily organizational, weaknesses. The last chapter, on Europe in the World Order, does not properly summarize the main themes of the book. It appears an addendum, rather than a concluding chapter. The links between chapters are moreover often unclear, as Calleo jumps from time period to time period, and somewhat unexpectedly alternates chapters on intellectual history and geopolitical history. It is the reader who must ultimately work to synthesize all the threads present in the book. The effort, as is the case with From the Nation State to Europe?, is worth making.

Through a Glass Darkly: Looking at Conflict Prevention, Management, and Termination By Stephen J. Cimbala. Westport, CT: Praeger, 2001. 224p. \$65.00.

Joseph B. Underhill-Cady, Augsburg College

One test of a book is how well it weathers major developments in world events, and, as with the end of the Cold War, the beginning of the new war on terrorism presents recent publications in international or military affairs with the danger of untimely relegation to the trash bin of history. After September 11, as we scramble to adjust and make sense of the "hunt for Osama," Stephen Cimbala's work, however, remains a useful compendium of lessons from several recent wars, crises, and ongoing military challenges. Although the book is not as suddenly relevant as Samuel Huntington's (1998) The Clash of Civilizations and the Remaking of World Order or Chalmers Johnson's (2001) Blowback: The Costs and Consequences of American Empire, the wisdom distilled within it is sound enough to apply equally well to the pre- and post-September 11 worlds. It is largely rooted in frameworks developed for studying the Cold War and superpower arms races, but Cimbala's examination of the new realities of military strategy and technology still has much to say about the war being waged in Afghanistan and the campaigns that are likely to follow.

Despite its poetic title, Through a Glass Darkly is a fairly prosaic treatment of six cases of U.S. military crisis or warfare, from the Cuban Missile Crisis up through the NATO campaign in Kosovo and challenges of information warfare, with concluding remarks on lessons learned for U.S. conflict management practices. Its primary audience is security studies scholars and graduate students, and those otherwise not needing to be told what "C4ISR" (Command, Control, Communication, Computers, Intelligence, Surveillance and Reconaissance) stands for. That said, several of the cases (particularly the Cuban Missile Crisis and Gulf War) cover some well-trod ground, and Cimbala's treatment of them would be useful to students who are new to those cases. The author is sufficiently modest in his claims about the cases, forgoing any attempt at broad, scientific generalizations. To his credit, he is aware of the limitations of the study and does not promise more than he delivers. Behavioralists and those favoring large-n studies (or even structured, focused case studies) will have to look elsewhere. For very different reasons, postmodernists, feminists, and those interested in the discourse of war may get some mileage out of the book's occasional use of sexual metaphors or the use of terms like "peace wars" (see pp. xi, 141, 170).

The central theme of Cimbala's reflections is the recognition and emphasis on the human and subjective elements of warfare-what Clausewitz called the "friction" of war. He explores the impact of changes in technology and increased sophistication of military hardware, while recognizing the imperfections that remain in the humans behind the machines. For someone so thoroughly versed in the technology and "bombs and rockets," this focus is both unexpected and admirable. He offers some persuasive arguments about the challenges of and need for seeing the world through others' eyes, and the dangers of an excessive optimism about the wonders of technology and of human ability to control that technology. This theme is illustrated through an extensive and in-depth investigation of his three past cases—the Cuban Missile Crisis, the tensions of 1983-84, and the Gulf Warand three current or future challenges-nuclear weapons and information warfare, nuclear proliferation, and military operations other than war (this last topic being of particular interest of late). The data used in analyzing them consists of a thorough reading of recent literature on the topic, some interviews, and a scattering of primary documents, but not an extensive new set of data; these are accompanied by some very useful tables that summarize and categorize such things as the survivable nuclear forces during the Cuban Missile Crisis (p. 11), targeting objectives during Desert Storm (p. 63), and a typology of different weapons and conflict types in the post-Cold War era (pp. 184-85).

The framework developed for looking at these cases, however, does not add much to our understanding of them. He groups the cases together into three categories—the conflict management, prevention, and termination of the book's subtitle—with one past case and one present or future case of each. The definitions offered for each of these three kinds of cases are useful enough, but they do not apply very elegantly to the cases picked, and the pairs of cases are poorly matched. For instance, the conceptual linkage between Intermediate-Range Nuclear Forces (INF) deployments in Europe and nuclear proliferation is weak at best (vertical and horizontal proliferation being very different animals); and it is unclear what lessons for peacekeeping missions might be derived from studying the success of bombing in the Gulf War. As he notes in the introduction (p. xi), one reason he picked these cases was just his interest in them, and that appears to have been the overriding factor.

As an example of work in security studies, Through a Glass Darkly frames the problems of conflict prevention or management as strictly military matters, and takes as unproblematic the goals pursued by the United States. The lack of attention to the range of underlying cultural, economic, or political sources of these conflicts, or to the ways in which U.S. foreign policy may be contributing to instability and provoking attacks, renders the treatment somewhat akin to trying to prevent house fires by installing more smoke detectors and fire extinguishers (laudable moves), while ignoring the potential problem with taunting or selling gasoline to the deranged pyromaniac next door. These studies take for granted the foreign policy goals of the United States and focus simply on how to achieve those goals, without examining the ways in which those goals might be problematic or counterproductive themselves. But security is too vague and slippery a term to leave unexamined, particularly when the U.S. military is in a position of such military dominance in the world.

But despite the fact that the book brackets this larger international political context and that there is not much that is startlingly new in the book, there is a healthy dose of venerable and well-supported pieces of wisdom regarding military affairs that bears repeating. With the bold cries for eradicating evil from the face of the earth and the increasingly technological nature of the "war on terrorism," reminders of the problems of hubris, ethnocentrism, and the general foibles and limitations of the human animal are both very timely and very welcome.

Learning to Manage Global Environmental Risks, vols. 1 & 2

Elizabeth R. DeSombre, Wellesley College

I have a colleague who collects maps of Africa that demonstrate a specific phenomenon: the developed world's unlearning of African geography. Across the centuries, the maps seem to show that mapmakers know less about the geography of the African continent—particularly the internal parts—than previously was the case. Rivers change direction; mountain ranges disappear. This unlearning, my colleague argues, comes from notions about the acceptability of sources of information previously used. These maps show the social nature of "learning," the idea that while in many cases there may be actual answers (after all, African geography exists), what information you look for, and from whom, determines how you will view the information you get, and ultimately what you will do with it.

Like geography, there may be a "right" answer to some of the world's atmospheric problems, but how these issues are defined, by whom, and when and where, has important impacts on how they are viewed and addressed. The ambitious project underlying these two volumes (with 37 contributing authors and countless research assistants and reviewers) attempts to examine the way countries of the world have evaluated, and responded to, environmental risks. "The Social Learning Group," as the authors collectively call themselves, do so by examining the responses of nine countries, the European Union, and international environmental organizations to three problems of atmospheric pollution: transboundary acid rain, stratospheric ozone depletion, and global climate change. The first volume, A Comparative History of Social Responses to Climate Change, Ozone Depletion, and Acid Rain, focuses primarily on country (and institution) case studies. The second volume, A Functional Analysis of Social Responses to Climate Change, Ozone Depletion, and Acid Rain, examines materials from across the countries and issues by what the authors call "risk management functions." The time frame within which they examine these issues, actors, and functions is chosen to be the 35 years between the International Geophysical Year in 1957 and the Earth Summit in Rio in 1992. Their aim is nothing less than a "long-term, large-scale, multinational perspective on global environmental management" (p. 3). In many ways they succeed.

There are multiple ways the authors could have organized the information presented here, and one of the most important aspects of this project may be what is not reported. So much work, for so many years, went into gathering systematic data for this study that the archives, stored at Harvard University, are likely to be invaluable to future generations of dissertation writers. Impelled perhaps by publishing necessity or the attention spans of potential readers, the authors and editors have had to seriously simplify the presentation of materials, and have taken only two passes of what could have been many through the information (by country and by function). By doing so they have demonstrated precisely what their volumes overall argue: How information is presented influences what you can do with it.

The first volume is organized by the responses of the countries examined—Germany, the United Kingdom, the Netherlands, the USSR, Hungary, Japan, Mexico, Canada, and the United States (along with the European Union and general international environmental institutions)—to the three environmental risks explored. This structure has both advantages and disadvantages. The country-by-country presentation becomes quickly repetitive. Precisely because of the learning that takes place across borders, the same information is presented as relevant to the decision processes of multiple countries, and it, along with the relevant acronyms and time lines, is discussed as if from scratch in each chapter. At the same time, the country-specific focus makes it easy to lose sight of the international or cross-border influences that are likely having an impact, since the information is presented from the perspective of the actors within a given country. Moreover, the chapters are structured to cover similar ground in a similar order, with the emphasis on the term similar; those hoping to skim through the chapters to find the information of most interest to them will have to look in slightly different locations in different chapters, and will find that some chapters cover some factors (the role of political structure, for instance) that others do not.

Nevertheless, some important ground is covered in these presentations. One of the most interesting approaches (demonstrating again both slight differences in implementation across chapters and vast quantities of work underlying seemingly simple presentations) involves graphs of the

attention given to environmental issues by national media. political decision makers, and scientific researchers. These can be used to explore the attention given within countries to an issue over time, and the relationship between scientific concern and popular attention. This approach is also used across countries (in Chapter 14, which draws conclusions from the preceding country chapters) to show what is often an eventual confluence of attention to a given issue, with climate change showing the greatest degree of simultaneity of awareness among the countries studied. This cross-cutting analysis also demonstrates that no one country of the group was the temporal or behavioral leader on all three issues examined. The comparisons also suggest that while countries may be addressing the same issue conceptually—acid rain, for example—on the international level, they do so by focusing on specifically local aspects of it in their domestic politics lake acidification in Scandinavia and eastern North America, forest dieback in Germany, the Netherlands, and Hungary. Act globally, frame locally.

Occasionally frustrating in the country presentations is what is hinted at in the data but not covered in the analysis or sufficiently discussed in all cases to independently evaluate. The role of the Netherlands as a small country with an open economy is suggested as being important for its approaches, but there is no systematic way to examine either of those variables. Accidents and governmental structures are mentioned in various chapters as playing a role in what countries do, but again, not explored across cases. One of the most interesting stories that repeatedly crops up is the difficulty encountered by antinuclear environmental organizations when faced with decisions about responding to certain environmental problems (acid rain or climate change) for which nuclear power could be a logical solution. This, as well, does not fit nicely into the set of variables examined in the country analysis. What gets lost most in the analysis tends to be the politics: who gains or loses most from different approaches to addressing the issue, who decides what decisions are made.

The second volume explores different functional aspects of responding to risks; it cuts across cases and countries to look at risk assessment, monitoring, option assessment, goal and strategy formulation, implementation, and evaluation. In most of these chapters, the primary findings are presented through stories—of how the "solution" of banning chlorofluorocarbon (CFC) use in aerosol spray cans was implemented first in the United States and then elsewhere, of how an initial focus on sulfur dioxide as the cause of acid rain eventually broadened to include other substances. Important general lessons are drawn as well. Risk assessments focus much more on emissions and concentrations of pollutants than on other aspects, though most chapters aspired to focus on end-toend assessments. These, as with some other functions, tend to be "sticky"; examining the role of carbon dioxide initially in climate risk assessments influences the likelihood that carbon dioxide will be the only gas considered when evaluating the risks associated with climate change (note that most models discuss the risks associated with a doubling of atmospheric carbon). Risk assessments also tend to progress from simple to more complex over time.

Monitoring often originates for purposes, largely scientific, prior to its being demanded for political processes. Information gathered from this process can have a huge impact on political decisions—witness Germany's conversion to being a supporter of acid rain controls after discovering its own forest dieback, and the international community's willingness to act on ozone depletion after the discovery of the Antarctic ozone "hole." More monitoring is done on the scientific aspects of the environmental problem than on impacts of it. Option assessment, the process of exploring the possible activities that

can be taken as a response to the environmental problem, focuses much more on reducing emissions than on adaptation activities or environmental modification. Formulation of goals and strategies across issues move within the time frame of the issue from capacity building to pollution reduction, and come to focus more on economic-based solutions (such as taxes or tradable emissions permits) in real time, such that issues addressed later are more likely to feature these types of solutions as goals. Implementation follows from the goals set in moving from building capacity to reducing emissions, and also shows an increasing emphasis on the use and strengthening of international institutions. Finally, the authors suggest that evaluation—of the process of addressing the environmental risk—is rarely done except as part of one of the other functions.

The social character of much of the learning is implicit but important. While it is true that rivers either flow one direction or the other and that carbon dioxide either does or does not have an impact on the global climate cycle, the actual "source" of the Nile depends upon how you define what the source of a river is. Likewise, our understanding of the role of global climate change may be about a doubling of carbon dioxide, about sea level rise, or about increased mean global temperature. These characterizations have everything to do with what we decide to look at, and what we define as part of the problem or part of the solution. With these volumes, our understanding of the geography of global atmospheric problems expands considerably.

Carrots, Sticks, and Ethnic Conflict: Rethinking Development Assistance Edited by Milton J. Esman and Ronald J. Herring. Ann Arbor: University of Michigan Press, 2001. 272p. \$49.50.

Stephen Ryan, University of Ulster

This excellent collection of essays takes the reader into a complex area: the relationship between economic development and ethnic conflict. It is such a tricky topic because there is consensus about neither what ethnicity is nor the contributions that economic factors make to the origins, dynamics, and resolution of ethnic strife. In fact the essays presented here steer clear of origins and resolution and focus instead on the less controversial area of how development policy impacts on the dynamics of ethnic conflicts. There is a great need for contributions in this area, because, as the introductory chapter by Herring and Esman notes, the international community is becoming more involved in humanitarian assistance and postviolence reconstruction initiatives in a number of protracted intercommunal conflicts. These include Bosnia, Kosovo, Israel and Palestine, Northern Ireland, and Lebanon. At the same time the increased awareness of ethnic conflict in the past decade has resulted in reassessments of what development means in a multicultural setting.

The volume is arranged into nine chapters. The contributors are all United States-based academics or analysts for aid agencies, and one is struck by the depth of knowledge that each brings to his/her respective area. At the core of the work are two chapters on the role of donor agencies (the World Bank and USAID) and five chapters that look at individual states. Perhaps the biggest strength of the volume are these detailed case studies of Kenya, Russia, and Ecuador and the two well-matched pieces on Sri Lanka. It is here that we learn how the grand theories of development economists and the political maneuvers of governments affect vulnerable people living in the real world.

The chapters on the donor organizations, by Gibson and McHugh, reach broadly similar conclusions. These are that

both the World Bank and USAID have attempted to pay more attention to the ethnic dimensions, but more could be done. In both organizations there is a tension between the ethnically aware fieldworkers and the policy makers back at headquarters. The result, at USAID, is a "curious failure to address ethnicity directly" (p. 69) and uncertainty about how to move forward in this area, while at the World Bank opinion is divided "between proponents of economic theory and those asserting the importance of qualitative social or cultural variables" (p. 43). However, disagreements are not just found in these organizations. Both writers point out that conflicts will also arise within ethnic groups in target areas about how to respond to development projects. This is a theme also taken up in Brysk's chapter on Ecuador. Here she identifies three responses to the liberalization strategies of the IMF: passive participation, political resistance, and the development of alternative economic strategies. This alerts us to the importance of intraethnic conflict and warns us not to engage in the reification of the ethnic group.

Most of the country-specific chapters show very well how development assistance can reinforce destructive ethnic interaction. Herring's analysis of the Sri Lankan conflict concentrates on the economic factors that contributed to the onset of the civil war in 1983. The chapter by Shenfield, on Russia, is perhaps the most dispiriting. He claims that the failure of development assistance to improve the dire economic circumstances of many Russians has resulted in a rise in support for extreme nationalist arguments that claim that Russia is being deliberately undermined by international aid agencies and a Jewish conspiracy. In addition, the rise of criminal gangs linked to groups in the Caucuses has resulted in a growing dislike and suspicion of minorities such as the Chechens. The final case study examines the adverse impact of IMF austerity programs on the Indian populations in Ecuador. A constant theme in these three chapters is the insecurity that can be produced by development programs.

The chapters by Cohen and Uphoff have slightly different emphases. Uphoff investigates the peacebuilding potential of development assistance through an analysis of the Gal Oya irrigation project in South East Sri Lanka. Cohen's chapter on Kenya, published posthumously, claims that those involved in aid-funded interventions have paid far closer attention to the ethnic dimension of their work than those who theorize about them at universities. He then backs up this claim by identifying projects in Kenya where those involved in the delivery of assistance consciously dealt with ethnic issues. One conclusion is that academics should spend less time trying to help aid workers understand the link between aid and ethnicity, for they already have a good grasp of this. Instead they should redirect their attention to the production of comparative case studies involving contributions from indigenous academics or expatriate field-workers that will produce more evidence enabling the development of guidelines to reduce negative

The concluding chapter by Esman, on the policy dimension of foreign aid, sets out some realistic guidelines for reducing the negative impact of aid. These include a greater sensitivity to the importance of context and a realization that one approach cannot fit all; a shift in the development assistance culture toward distributional and human rights themes; a priority on social peace rather than distributive justice; and ethnic conditionality on aid, with greater use of ethnic impact statements.

Interesting concepts such as "development diplomacy" (Ed Azar) and "ethnodevelopment" (Rudolpho Stavenhagen) are not addressed or tested in this volume, and this reviewer would have liked more on both the "peace through development" idea and the peacebuilding potential of foreign aid

discussed in the chapter by Uphoff. The role of NGOs, which are hardly mentioned in the case studies, might have been developed further. It is also a shame that although the editors seem to agree with Cohen's plea for detailed comparative studies leading to more effective policy guidelines, they were not able to meet his call for a stronger input from indigenous academics. There are chapters from representatives of the aid givers but not the aid receivers. However, these comments cannot take way from the quality of the work presented here. The book illuminates the ethnic dimensions of development assistance and shows how ignorance, indifference, and commercial and state interest can turn international projects into catalysts for ethnic conflict. Fortunately, it also offers some sound advice on how this can be avoided.

**Power and Conflict in the Age of Transparency** Edited by Bernard I. Finel and Kristin M. Lord. New York: Palgrave, 2000. 371p. \$49.95.

Edward Comor, American University

According to editors Bernard I. Finel and Kristin M. Lord, "the puzzle for analysts of international affairs" in relation to transparency is not only how it has weakened states, "but also how it has strengthened them" (p. 2). Transparency, for them, is "a condition in which information about governmental preferences, intentions, and capabilities is made available either to the public or other outsiders" (p. 3). This apparently increasing openness is the outcome of, among other things, emerging communication and information technologies, the widespread adoption of democratic institutions, and the global reach of mass media organizations. Although transparency is "transforming international politics" (p. ix), it has been underassessed and, as such, Finel and Lord aim to examine "the phenomenon" in a "comprehensive way and assess its impact on world security and diplomacy" (p. 6).

The 11 chapters presented between the editors' "Introduction" and "Conclusion" (several of which have been published in some form elsewhere) generally follow these analytical parameters. Most begin with an empirical generalization. Authors then attempt to explain it through some kind of systematic analysis related to transparency. But the absence of a rigorous assessment of the concept itself—as conveyed, for example, in repeated references to transparency's ascendancy as a result of post—Cold War "trends"—and the positivist approach used by most of the contributors ultimately lead to frustrating roadblocks and limited results.

Setting the tone is a broad analysis by Ann Florini (Chapter 1). She portrays transparency in terms of the decline of states and sees global civil society as an increasingly central arbiter of information. In tune with the forward march of democratization and globalization (both apparently as inevitable as death and taxes), "the world is embracing new standards of conduct, enforced not by surveillance and coercion but by willful disclosure: regulation by revelation" (p. 17). Beyond the inherent (but here unrecognized) theoretical and empirical problems involved in treating state-civil society relations in terms of what amounts to an either/or framework, the chapter constitutes a largely descriptive presentation. Both the book's "Introduction" and this opening chapter leave the reader asking questions that emerge again in the pages that follow: Is transparency itself a concept (or phenomenon) worthy of this much attention and, if it is, what are the complex dynamics and processes shaping its trajectory and implications?

Following Florini, Robert Jervis's 1985 piece "From Balance to Concert" is revived. Kenneth A. Schultz follows with a chapter on the impact of transparency on international

crisis bargaining (Chapter 3). In Chapter 4, Jeffery Ritter assesses the diplomatic capabilities of democracies in light of transparency. These three focus on nation-state relations with little or no sociological nuance. A similarly limited analysis is found in Ronald Mitchell's "Sources of Transparency" (Chapter 7). It reiterates and expands upon trends promoting transparency and takes a particular interest in its implications for regime rules and effectiveness.

Such chapters are remarkable in that their theoretical and empirical limitations underline the fact that transparency, if it is to be taken as seriously as "global civil society," "global governance," and other such emerging concepts, cries out for analyses that venture significantly beyond the confines of neorealist assumptions and positivist models. Dealing with transparency in these terms is tantamount to assessing the cultural implications of international trade using a neoclassical economics perspective alone.

Some relief is provided in Douglas A. Van Belle's provocative chapter "Press Freedom and Peace" (Chapter 5). Van Belle assesses why press freedom is more strongly correlated with the absence of war than the latter is with the presence of democracy. Structural conditions, such as the commercial free press's penchant for entertainment and relatively sociological constructs like "legitimacy," are featured in the discussion. While helpful, these remain undertheorized and, as such (and as Van Belle himself puts it), his chapter "tends to generate more questions than answers" (p. 131).

Still more questions emerge in the chapter that follows by Finel and Lord (Chapter 7). Through case studies, they raise doubts in response to some of the more optimistic evaluations in the book. "It is possible," they write, "that both very high transparency, because it accurately signals intentions, and very low transparency, because it prevents the 'noise' of domestic politics from overwhelming diplomatic signals, allow states to diffuse crises. If accurate, only moderate transparency would exacerbate crises, because it would allow enough information to confuse the opponent, but not enough to clarify peaceful intentions" (p. 167). Again, the narrowness of the analytical worldview used to assess transparency delimits what can be revealed. The result is more ambiguity than precise elaboration. To their credit, Finel and Lord understand that in relation to particular issues "an unfortunate methodological gap between the most plausible explanations... and our ability to examine convincingly the causal processes" is present (p. 168). Indeed, the gap in question is more fundamentally an epistemological one, and recognizing this compels the reader to ask the editors why a more ambitious effort was not made to assess transparency's implications on interstate relations through supplemental critical and interpretative approaches.

Chapter 9, "Transparency and the News Media," by Steven Livingston, delineates three types of transparency domestic, imposed, and systemic—and through these he argues convincingly that media effect transparency in different ways in different contexts. Chapter 8, by John C. Barker and Ray A. Williamson, provides a detailed overview of commercial satellite developments and, importantly, raises the issue of information's credibility (also addressed by Schultz, Ritter, and the editors). Clifford Bob's contribution (Chapter 10) provides still more nuance in asking, in effect, how information is related to what is known. Here, more than in any other chapter, structural factors are carefully assessed. Complementing Livingston's contribution, Bob demonstrates that information is produced and distributed in the context of historically produced (and power-laden) structures that, almost invisibly, influence what information is made available and to whom. Perhaps in response to some of the book's other authors, Bob concludes with the following observation: "While for simplicity's sake, analysts may seek to understand the role of transparency in the dyadic relationship between two state opponents, a more comprehensive and accurate understanding is likely to be gained by expanding the conceptual and empirical scope. . . . Doing so also makes clear that transparency and the broader concepts of visibility and fit are not static, but dynamic and contested concepts in every conflict" (p. 308).

The final chapter in the collection is by James N. Rosenau. It is the most thought provoking and, perhaps not coincidentally, one of the least focused on transparency itself. Using his now-familiar concept "fragmegration," Rosenau treats transparency as more than just another variable and raises questions involving the affects (rather than straightforward effects) of information flows in shaping what different people think at different times and in different places.

In their "Conclusion," Finel and Lord write that "transparency is a complicated matter that rarely either harms or improves international security in any single, unequivocal way" (p. 339). Indeed, very few claims are made as a result of the preceding chapters. Two exceptions, however, are revealing. One is the effects of communications technologies and mass media on the timescales used to make decisions. As a result of instantaneous transnational information flows, "policies are likely to be examined in less depth and probably by a smaller group of participants. The participants may also filter incoming information to support previously held beliefs and rely heavily on cognitive shortcuts, the improper use of analogies, and unexamined assumptions, which can lead to misperception and faulty judgments" (p. 348). Another is the importance of "skills" in the task of comprehending and utilizing "information wisely" (p. 351).

When this book reaches such conclusions in light of its analytical limitations, the difficulty (if not impossibility) of assessing transparency's implications without a far more theoretical, sociological, and, indeed, epistemologically diverse inquiry becomes all too clear. Questions concerning forces and processes rather than relatively ahistorical trends, the complex implications of structures, standards of "legitimacy" and 'credibility," the cultural (and even psychic) implications of rapidly changing time frames, and others raised in relative isolation need to be interconnected and fleshed out, and a more challenging research agenda suggested. Subjects directly relevant to the editors' mandate, but conspicuously absent here, include transparency's implications in relation to what communication theorists call "hegemonic framing," the potentials of what some critical scholars refer to as "the Panoptic gaze," and broader questions concerning power as more than just a reflection of state and/or civil society resources.

One has little doubt that many will find this collection to be helpful and interesting—it certainly has its moments. But those who recognize transparency to be a concept requiring some comprehension of the historical and sociological processes through which information shapes knowledge will be disappointed. Bold steps are needed in response to the big questions raised in this book. Sadly, only a few of its contributors begin the task of formulating a truly comprehensive response.

**Governing the Internet: The Emergence of an International Regime** By Marcus Franda. Boulder, CO: Lynne Rienner. 2001. 255p. \$49.95.

Bernard I. Finel, Georgetown University

For many people, the Internet is simply a mass of information that arrives on their desktop through the miracle of e-mail or web browsers. The existence of reasonably efficient and intuitive interfaces, however, serves to mask the incredible complexity inherent in the establishment, growth, and maintenance of a global tangle of computer networks administered by a variety of universities, private corporations, governments, and individuals.

In this impressive new book, Marcus Franda seeks to shed light on the emergence of a governance structure for the Internet by examining the process in light of Oran Young's multistage framework for understanding the development of international regimes (p. 20). He looks at governance in terms of the management of the technical side of the Internet, but in separate chapters he also examines the development of frameworks for e-commerce, intellectual property, international law, and international security. There are a number of importance conceptual puzzles in this topic. First, the subject has implications for theories of international cooperation. Scholars have largely focused on the sources of state cooperation, although some recent work has focused on the rise of transnational activist networks (Margaret Keck and Kathryn Sikkink, Activists Beyond Borders, 1998). There is a lack of theorizing about cooperation across level of analysis among states, individuals, and organizations—perhaps because of the daunting conceptual problems of theorizing about the collective behavior of such dissimilar actors. Second, the question of Internet governance is intriguing because it crosses various usually distinct policy issues areas, namely, technology, politics, security, law, business, and economics. There is extensive conceptual work about how cooperation evolves in each of these areas, but relatively less about how actors can develop cooperative frameworks that bridge these different sets of issues. Finally, the growth of the Internet raises important issues about the devolution of state power onto nongovernmental organizations—a trend noted but rarely fully explained in the globalization literature. Although the backbone of the Internet was created by the U.S. government, by the 1990s it had become U.S. government policy to surrender most of its regulatory authority to various nongovernmental organizations and committees. This commitment to devolution remained strong even after the massive commercial and political potential of the Internet became evident—indeed, it was in part the rapid growth of the Internet that prompted the U.S. government to shed its responsibilities. How do we explain this dynamic? This is especially interesting given that, in many countries around the world, governments try to control the Internet—not only authoritarian states such as China, but Western democracies such as France. What are the causes of these variances?

Franda's work is suggestive about some of these issues but. unfortunately, fails to address many of them explicitly. The book is largely descriptive. Franda tells a very complicated story as coherently as possible. This is an impressive accomplishment for a topic that requires an appendix with a full four and a half pages of acronyms, from the ABA (American Bar Association) to XML (Extensible Markup Language) (pp. 217-21). Still, there are places in which Franda seems to be writing in shorthand. For instance, his comments about the "DNS wars" of the 1990s are probably meaningful only to readers with detailed knowledge of the case (pp. 57-9). The problem with the narrative is not the lack of the detail; rather it is the overabundance of details. Franda describes literally dozens of initiatives in which proposals were put forward only to be defeated by affected stakeholders leading to compromises and new initiatives. Consider, for instance. his discussion about unsuccessful efforts of the International Ad Hoc Committee (IAHC) to develop a new governance structure for the Internet (pp. 50-51). Franda is trying to paint a picture of a dynamic process in which agenda formation is a distinct and prior step to negotiation, but with the exception of some comments at the beginning and end

of chapters he rarely makes those conceptual points clearly, nor does he explain their significance to the development of regime theory. Indeed, in some cases, Franda acknowledges that his framework is largely irrelevant: "When one goes beyond the technical and commercial components of these early years of the Internet's evolution, however, one encounters a number of elements that are not yet fully within the scope of even rudimentary international regime arrangements" (p. 145). These areas include important issues such as the relation of cyberspace to international law, privacy issues, and regulations on content (pp. 145–46).

Significantly, Franda's conceptual framework is ill equipped to illuminate the most interesting aspects of the case. Though he relies heavily on Young's argument that regimes develop by stages—agenda formation, negotiation, and operationalization—Franda's work does not constitute a rigorous test of the framework, although the development of a governance structure for the Internet does seem to follow the stages described by Young. The lack of discussion of evaluative criteria and alternative explanations precludes this book from the claim of theory testing. Young's framework is, more than anything else, a loose organization device. Franda does not seem particularly interested in regime theory in any case, and the discussion of it seems tacked on. This book is largely descriptive, even if what is described is a uniquely interesting case.

Despite the lack of conceptual innovation, this book will be of interest to social scientists, especially those interested in technology policy. Franda's description of the way in which individuals and organizations maneuvered provides wonderful examples of the dynamics of agenda formation. His presentation is particularly interesting because of the role of several individuals who served as policy entrepreneurs and were empowered by their command over some of the technical details of how the Internet functions. It is quite amazing to realize that as recently as 1998, important policy decisions could be affected by essentially free agents, unaffiliated with any particularly powerful stakeholder. The picture one gets is less of the rise of an epistemic community but, rather, the way in which control over information can empower individual actors on complex technological issues or, theoretically, on any issue where there is a quasi-monopoly on information.

Franda's book provides fewer insights into Young's second and third stages. His discussion of various negotiations is cursory, limited to discussions of initial positions and ultimate agreements. Many of the negotiations Franda discusses required consensus to be successful, but Franda rarely provides us with enough details to see how consensus evolved. His discussion of the operationalization phase is similarly limited, although here Franda is at the mercy of publication deadlines and the fact that many issues were still unresolved at the time the book went to press (and remain unresolved today). Given how quickly Internet governance has evolved over the past several years, Franda could do little more than report on recent developments. His lack of discussion of whether the Internet Corporation for Assigned Names and Numbers (ICANN), for instance, has been able to function as expected is understandable.

Franda also fails to discuss what seems to be one of the major puzzles of the case, namely, why the U.S. government sought to devolve control over the Internet to nongovernmental actors. Franda hints that the high costs of governance were part of the reason, but for the most part he simply states that U.S. policy was to support the development of an independent governance structure. Given the government's initial and continued investment, this seems curious. Furthermore, the willingness of the U.S. government to support essentially a preferential commercial regime—particularly with regard

to the issue of sales taxes-for Internet commerce is puzzling. Franda does not explain the sources of U.S. government preferences or how they are different from the preferences of other governments—this is an issue if we hope to draw larger conclusions from the case. Franda notes, "An indication of the unique U.S. legislative environment on international taxation of the Internet was the October 1999 vote in the House of Representatives (423-1) in support for a resolution calling for the Clinton administration to seek a permanent moratorium on international e-commerce tariffs at WTO meetings" (p. 95). Was this resolution the result of well-placed policy entrepreneurs such as Al Gore? What was the role of various stakeholders in affecting government policy, including people such as Microsoft founder Bill Gates? How important were emerging norms of openness and transparency in supporting a hands-off posture? These are all crucial issues given the U.S. government's unique position vis-à-vis the Internet, but these concerns are largely outside of Franda's

With the "dot com meltdown" it is tempting to dismiss the importance of the Internet. However, its role in allowing information flows and, ultimately, its contribution to global commerce will undoubtedly make the Internet a continuing area of interest in the future. Marcus Franda's examination of the rise of an Internet governance regime is an interesting contribution to what is ultimately likely to be a voluminous literature. He should be commended for tackling an important issue, and for his clear exposition of an incredibly complex process. Unfortunately, Franda's focus on details at the expense of conceptual innovation or in-depth analysis limits the importance of this volume for most social scientists. For scholars working on issues related to the public policy of information technology, this book is a useful resource, albeit one that is rapidly aging. For the rest of the scholarly community, the definitive book on the conceptual issues related to Internet governance remains to be written.

The Environment, International Relations, and U.S. Foreign Policy Edited by Paul G. Harris. Washington, DC: Georgetown University Press, 2001. 276p. \$65.00.

Adil Najam, Boston University

The basic premise of Paul Harris's edited volume is that "understanding U.S. international environmental policy is central to the entire project of global environmental protection" because the United States is the "world's largest polluter [as well as] the world's wealthiest country" (p. 4). To argue that the United States is disproportionately important to international environmental policy (or to international policy on most other issues) is an important, but relatively uncontroversial, case to make; and it is made rather well throughout the chapters in this book.

This volume is the result of an extended project on environmental change and foreign policy and follows at the heels of a companion volume that looked specifically at U.S. foreign policy on climate change. Unlike its predecessor, this volume is not focused on a particular issue and is more interested in drawing general lessons about U.S. environmental foreign policy. Its chapters can be divided into two distinct streams. One set of chapters—including those by Braden Allenby, Jon Barnett, Douglas Blum, and Harris—deal with the still contentious but vibrant area of environment and security. A second stream, based on case studies, highlight the roles played by various stakeholders in the U.S. environmental foreign policy process. This set includes chapters by Srini Sitaraman, John Barkdull, Robert Falkner, Morten Boas, Elizabeth DeSombre and Kristen Fletcher.

Between the two, the book provides a rich array of ideas and case evidence that will add to our understanding of U.S. foreign policy on the environment. Among the two, however, there is less than perfect coherence, in that the case studies do not seem to place the discussion on environmental security at the same level of centrality to the actual practice of U.S. foreign policy as the chapters in the first stream would suggest. For example, Barnett's suggestion that "the concept of environmental security is now integral to the environmental diplomacy of the United States" (p. 68) seems not to be borne out by the various case studies of U.S. environmental diplomacy presented elsewhere in the book. The case made in the various chapters (particularly those by Allenby, Barnett, and Harris) for changing the way we look at the issue of environment and security is certainly appealing at a normative level, but may not be terribly useful at the pragmatic level. Indeed, other chapters in the book (especially Sitaraman and Falkner on the ozone regime, Barkdull on the role of the executive branch on ocean issues, and DeSombre on environmental sanctions) seem to suggest that meaningful advancement in terms of environmental foreign policy can be made without necessarily "securitizing" the issue.

The case chapters on how domestic and international concerns are intertwined in the formulation of U.S. foreign policy provide a rich and textured discussion of the various actors involved in the process. These chapters—in particular, the discussions on the pivotal role that the executive branch plays in international environmental policy and on the role of environmental sanctions—make significant new contributions to our understanding of what the "sausage factory" looks like from the inside. The major contribution of the book is that it depicts the much-commented-upon "messiness" of U.S. foreign policy, particularly as it relates to the environment, rather vividly. As the editor points out in his introduction: "Perhaps the foremost among the conclusions of this volume is this: the highly pluralistic nature of U.S. foreign policymaking results in an inevitably large number of players, ranging from individuals to businesses to nongovernmental organizations. The number of local, state (i.e., U.S. 'states'), regional, national and international stakeholders involved in these issues is vast" (p. 35). But, Harris continues, "the number of actors is not the end of it; the U.S. Constitution created a contentious, multibranch government that does not resolve issues quickly, smoothly or easily. This convoluted democratic system is compounded by the number and complexity of the problems themselves. Thus foreign policy that emanates from Washington is almost inevitably unsatisfactory to all those involved" (p. 35).

It should be noted, however, that recognizing the complexity of the U.S. foreign policy process must not be confused with assuming that it is necessarily more complex than foreign policy processes elsewhere. While the U.S. environmental foreign policy process exhibits interesting peculiarities, U.S. peculiarities need not be any more peculiar than those of other states. Indeed, this volume does not seek to make that case. However, the point needs to be made simply because such a misunderstanding can be too easily construed from the book.

Which Lessons Matter?: American Foreign Policy Decision Making in the Middle East, 1979–1987 By Christopher R. Hemmer. Albany, NY: SUNY Press, 2000. 217p. \$17.95 cloth, \$55.50 paper.

William B. Quandt, University of Virginia

At least since Ernest May's influential (1973) 'Lessons' of the Past, students of American foreign policy have been conscious of the powerful hold that some analogies seem to

have on the minds of decision makers. All of us can think of "Munich" and "Vietnam" as shorthand for a whole series of judgments that we rely on to work through the maze of foreign policy calculus. In the aftermath of the World Trade Center attack in September 2001, we heard reference to "Pearl Harbor." And we can now anticipate that "9-11" will take its place as a marker for a set of lessons concerning the struggle against terrorism.

As Christopher Hemmer reminds us in this useful book, analogies are relied upon by decision makers for understandable reasons. They need reference points from the past as they confront an uncertain future. But analytically, there is a problem: How much explanatory weight can one give to the role of analogies? And, as Hemmer asks, "which ones matter?" After all, there is an infinite repertoire of so-called lessons from the past. And we know, at least anecdotally, that those who make policy are likely to dress up the untidy process of decision making by evoking important-sounding "lessons of history," even when these are little more than post facto rationalizations for actions taken.

Hemmer's approach to answering these questions is twofold. First, he provides a framework for thinking about the role of analogical reasoning in the policy process. Second, he develops two case studies in depth, Carter's response to the hostage crisis in Iran and Reagan's handling of a similar crisis a few years later, the "Iran-Contra" affair.

Hemmer sees analogical reasoning as a complement, not an alternative, to realist notions of strategic reasoning. As he correctly points out, a rational strategist will have no trouble identifying why the United States should react to Saddam Hussein's invasion of Iraq, for example, but will still not know precisely which of several plausible strategies is best suited to the specific situation: "[W]hile most policy makers often know what interests they want to promote, they often do not know what specific policy will further those interests, so they turn to historical analogies for crucial information concerning what policy will best advance their interests" (p. 15). That judgment requires some degree of reasoning involving "lessons" of history. My own research on the Gulf crisis of 1990-91 suggests that the "Korean analogy"-be careful of expanding goals in the midst of a war—and "Lebanon"—be careful of the fragmentation of the country-were both consciously discussed by President Bush and his closest advisers. One cannot understand the American decision to stop short of overthrowing Saddam's regime without understanding the role of these lessons.

An important contribution of Hemmer is that he does not treat decision makers as passive victims of the analogies they carry in their heads. Instead, he sees them as actively analyzing the relevance of different lessons from the past. They tend to look first at recent history; they weigh the relative international and domestic consequences of a crisis as they look for appropriate guidelines; and they look for causal similarities. By attributing to analogies a role in structuring the definition of interests, Hemmer places himself in the constructivist camp within the international relations brotherhood.

Turning to the case studies, Hemmer finds that Carter and his colleagues consciously considered a wide range of historical precedents as they struggled to find a way to end the hostage crisis. Several examples of successful negotiations competed with more muscular examples of rescue attempts. Over the months of the crisis, the debate moved from one to another, and then back to negotiations. The result was not elegant, although the hostages were eventually released, but Hemmer's case does show the extent to which policy was informed by a conscious use of analogical reasoning.

The Reagan case is different, at least in Hemmer's telling. Although there was some attempt after the embarrassing

revelations of the arms for hostages dealings to dress up the policy as comparable to Nixon's opening to China, the record shows that Reagan was primarily driven by another preoccupation—not being crippled by the hostage crisis as Carter had been. His "use of history" largely focused on the domestic consequences for Carter of struggling with the hostage issue. He was determined not to let Carter's fate befall him, and so he sought a quick resolution to the crisis by offering arms in exchange for the release of the hostages. A bit more thought by the president and has inner circle might have led them to realize that they were inadvertently providing an incentive for more hostage taking, but that lesson was apparently not seen at the time.

I find the theoretical and empirical contributions of Hemmer's book to be quite impressive. He writes clearly, has done his homework on the cases, and makes a modest contribution toward constructivist thinking in foreign policy analysis. I have used the book in an advanced course on foreign policy, and students find it accessible and generally convincing. The book ends with some suggestions for further research, and it will be interesting to see where Hemmer goes next. Based on his debut, his future work will be worth waiting for.

Differential Europe: The European Union Impact on National Policymaking By Adrienne Héritier, Dieter Kerwer, Christoph Knill, Dirk Lehmkuhl, Michael Teutsch, and Anne-Cécile Douillet. Lanham, MD: Rowman & Littlefield, 2001. 368p. \$75.00 cloth, \$29.95 paper.

James A. Dunn, Jr., Rutgers University, Camden

National-level policy outcomes produced by European Union—level directives and regulations are much more diverse across member states than one might expect. This is especially true for those undramatic but complex policy areas that lack the salience of high-level negotiations and treaty signings. Adrienne Héritier and her five coauthors investigate the phenomenon of differential national responses to European policymaking in two transportation policy subareas across five states. They focus on the deregulation of road haulage (trucking) and the reform of publicly owned railways in the UK, France, Germany, the Netherlands, and Italy. This allows them to show just how widely national policy outcomes can vary and still be generally in line with European Union (EU) requirements.

The authors point out that EU policies in road haulage and railroads aim at "market making" on the European level, that is, the reduction or abolition of previous national state interventions in order to allow market forces to deal with a problem. This represents an attempt to roll back the frontiers of the (interventionist) state. In principle, all stakeholders stand to benefit from the efficiency gains that can be achieved. In practice, of course, there are numerous conflicts over the distribution of costs and benefits.

The most crucial aspect of establishing a single European transport market in road haulage was the introduction of "cabotage," the authorization of nonresident trucking firms to operate in foreign domestic markets. Thus, a Dutch trucking firm can now haul goods not just between Amsterdam and Paris but also between Lyon and Marseille, under the same regulatory conditions as a French firm. Even so, national policy responses have been markedly different. Cabotage and EU-level policies produced more deregulatory reform in the Netherlands, but resulted in significant new social reregulatory efforts in France, and increased economic interventionism in Italy.

In railway reform, the deregulatory thrust of EU-level policy directives was very cautious. It only required more

financial transparency for state subsidies and separate accounting systems for investments in rail infrastructure, as well as for subsidies for train operations. This was just the beginning of a process aimed at reducing the deeply imbedded territorial monopolies of the continent's nationalized railroads. The end of the process in the far future might see a private German rail company operate its trains from Frankfurt into Paris on the same financial basis as French trains. Here, too, actual policy outcomes have differed widely. The UK's dismemberment and privatization of British Railways into a for-profit company that owned the tracks and a separate group of private companies that operated the trains went far beyond EU requirements. Carried out under Prime Minister John Major, it was driven by a Thatcher-era ideology of free market capitalism, and directives from Brussels played no role in motivating it or shaping its provisions.

By contrast, French politicians and interest groups denounced "liberal" interference by Brussels and stoutly resisted modest efforts to begin the "reform" of the Societe Nationale des Chemins de Fer Français (SNCF). They cited the ideology of "public service," which provided for rail service to remote regions, helped balance traffic via rail, road, and air, and justified the tradition of generous wages and pensions paid to the unionized cheminots as helping to raise the standards for the rest of the working class. Ironically, the unions were always ready to strike and deprive the public of its rail service until they got what they needed from the government. French rail policy makers and SNCF officials complied minimally with EU directives by creating a new state-owned company, Réseau Ferré de France, giving it legal responsibility for the rail infrastructure and financial responsibility for the multibillion dollar debt of the SNCF. But little has changed operationally. And as far as German trains pulling into Paris is concerned, the word still seems to be: "They shall not pass!"

One of the great strengths of this book is the systematic and focused approach to its subject. Such discipline is unusual in a book with six coauthors and five country chapters. Héritier and her colleagues review the major theoretical approaches to European integration and policymaking. They develop a common analytic framework of explanatory variables and apply it to each country chapter. They draw sound and well-supported comparative and theoretical conclusions on the basis of their framework and the evidence developed in the country chapters. The combination of their methodical approach, a somewhat ponderous writing style, and a high level of assumed background knowledge will make this book most useful to advanced graduate students and specialists in European integration and European transport policy.

Finally, one can say that the tight, disciplined focus of the authors is in a sense also a weakness, or at least a source of some frustration for readers familiar with the European transport policy scene. One sometimes gets the sense of missing important parts of the forest in order to examine a few selected trees very, very closely. For example, in their discussion of French rail policy in the 1970s and 1980s, the authors do not even mention le train à grande vitesse (TGV)—the word does not even appear in the chapter. Yet it was the much-vaunted success of high-speed rail as both a transportation mode and an export product (TGV technology was sold to nations as diverse as Taiwan and the United States) that enabled the SNCF to weather the domestic financial and political storms of the 1990s. And it was the barely concealed rivalry between the French public/private industrial complex backing TGV technology and the German groups pushing the InterCity Express (ICE) steel-wheel-on-steel-rail fast trains, as well as the Transrapid magnetic levitation technology, that fueled insider gossip and speculation at transport meetings in Brussels, Bonn, and Paris in those years.

Of course, no single book could cover every important aspect of transportation politics and policymaking at the European and national levels. Within its self-imposed limits, this study admirably achieves its goal of demonstrating that diversity remains alive and well in European nations' transport policies, despite the hopes (and fears) that many have concerning EU-level policymaking.

The Armies of East Asia: China, Taiwan, Japan and the Koreas By Dennis Van Vranken Hickey. Boulder, CO: Lynne Rienner, 2001. 280p. \$55.00.

Mary P. Callahan, University of Washington

This book is a detailed study of recent changes in security threats and defense forces in China, Taiwan, Japan, South Korea, and North Korea. The author argues that East Asia is in the midst of an arms race "of unprecedented scale" (p. 231). The major threats ("flashpoints") in the region are the tensions between North and South Korea, the conflict between the People's Republic of China and the Republic of China over the future of Taiwan, and the competing claims to oil and other natural resources in the South China Sea. The range and character of these threats have not changed appreciatively in recent years, but what has changed are capabilities of militaries to project power, threaten neighbors, and destabilize the region.

Culling his data from an impressive range of primary and secondary English-language sources and from a handful of interviews, Hickey shows how the five countries rethought and reequipped their defense establishments in the 1980s and the 1990s, largely according to the way they perceived shifts in the balance of military, economic and political power in the region. After the collapse of the Soviet Union and the emergence of the United States as a nearly unrivaled hegemon, each East Asian country under review bought new weapons systems, courted new allies and redefined old alliances, and increased high-technology warfare capabilities. While Hickey notes that it "would be a gross exaggeration to claim that the smell of war is in the air," he nonetheless argues persuasively that the region is "more insecure as it enters the new millennium" (p. 239).

The book's title is misleading, as Hickey's findings are less about the armies of East Asia than the regional arms race(s) and sources of instability. Because his concern throughout is that U.S. policymakers recognize both the subtle and the major shifts in defense postures in the region, this book should be considered a fundamental text for Pentagon planners as they rethink strategy toward Asia in the coming years. As such, Hickey provides a largely atheoretical narrative of what he calls "the military buildup in East Asia" (p. 1). The absence of explicit theoretical claims in the book, however, does not limit its value to scholars interested in comparative or theoretical analysis. In a sense, Hickey has done the grunt work, providing one of the very few integrated studies of defense establishments in Asia. While his framework focuses on external phenomena (such as the collapse of the Soviet Union) as the causes of changes in Asian military strategies and force structures, he also hints at the way domestic political conditions make some reforms possible and entirely rule out others. For example, in his chapter on Japan, Hickey notes that the gradual loosening of restrictions on using the military in anything but a purely defensive manner could come only with greater chronological distance from World War II. However, like many others who study the defense policies and military strategies of other nations with an eye toward generating recommendations for the United States, Hickey treats these policies largely as unified, unproblematic national reactions to international and regional forces, rather than as the outcomes of often hard-fought political struggles at home. In fact, for much of this book, the militaries of these countries come across purely as tools of the state, rather than as the highly political institutions that they are. Armies are made up of multiple sets of interests that often conflict with those of other national political agents and that cause splits even within the defense forces. Hickey alludes to what surely must have been divisive political struggles in his discussions of factions within the South Korean military and the People's Liberation Army but provides little analysis of how and why these factions rose and fell and how they stabilized or destabilized national and regional security.

The book's focus really is not the armies of East Asia but, rather, how the United States can take charge of security in the region. He never questions his assumption that the United States will be a-if not the only-major determinant in how these arms races play out. Among his policy prescriptions are calls for the United States to convene arms reduction conferences to prevent "what appears to be an unintended drift toward war" (p. 235) and to take charge of building a "genuine multilateral security forum for East Asia" (p. 235), one that is more binding than currently exists and that looks much more like a NATO arrangement. Hickey gives little sense that these initiatives could backfire on the United States or be politically unacceptable to national leaders in the region, thus contributing to longer-term volatility rather than stability (think the U.S. failure in its SEATO [Southeast Asia Treaty Organization] initiative).

Aside from the inevitable difficulty of any attempt at predicting outcomes of highly political processes, the major weakness in the book is the absence of any serious attempt at systematic comparative analysis. Only seven pages of the conclusion engage in explicit comparison across the cases, despite the enormously significant similarities and divergences that emerge from the country chapters. This absence is not unexpected given Hickey's target audience, which appears to be the U.S. defense policy community. Nonetheless, the case chapters are filled with potential comparative insights that suggest fruitful avenues of inquiry for future researchers. Some examples are as follows: All of these militaries are downsizing their numbers of personnel to some degree or another. How are they doing this? And what impact does force reduction have on the social, political, and economic landscape of countries still weathering the economic crisis? Where are these men (and they all appear to be men in these cases) going to find employment? How will the next generation of young men be educated in citizenship if conscription is eliminated, for example, in South Korea? And how do these sociological changes in the domestic realm affect the stability of the East Asia region? Another commonality is that all of these militaries have emphasized much greater transnational linkages among their officer corps. How has this trafficking in officers influenced defense policy? Have more frequent intraregional contacts contributed to greater understanding and communication and, hence, made the region more stable? Or have military leaders come back from junkets abroad more committed than ever to building up stronger militaries to compete with those of the nations visited?

Environment, Scarcity, and Violence By Thomas F. Homer-Dixon. Princeton: Princeton University Press, 1999 253p. \$45.00 cloth, \$18.95 paper.

Marian A. L. Miller, University of Akron

In Environment, Scarcity, and Violence, Thomas Homer-Dixon continues his examination of environmental scarcity. This exploration of the links between environmental scarcity and violent conflict captures much of the related complexity. He finds that scarcities of renewable resources, such as cropland, freshwater, and forests, can contribute to civil violence. As scarcities worsen, the incidence of this kind of violence is likely to increase. Although he acknowledges that environmental scarcity "by itself is neither a necessary nor sufficient cause" (p. 7) of violence, he argues that analysts should not underestimate its importance: Some conflicts cannot be clearly understood without an examination of the role of environmental scarcity. In this work, he offers "analysts and policymakers a tool kit of concepts and generalizations that they can use to analyze, explain, and sometimes predict connections between environmental scarcity and violence around the world" (p. 73).

He reviews the debate among analysts with neo-Malthusian, economic optimist, and distributionist stances. They offer differing explanations for economic scarcity: Neo-Malthusians emphasize physical causes, such as population size and growth; economic optimists focus on market failures and inappropriate policies and institutions; and distributionists stress social structures and political behavior. He suggests that the principal contribution of the book will be to synthesize these three perspectives.

Homer-Dixon focuses on renewable resources "that are both rivalrous and excludable" (p. 48). He sees them as being subject to three types of scarcity: supply-induced, demandinduced, and structural scarcities. These scarcities interact and reinforce one another, resulting in resource capture and ecological marginalization. Structural scarcity is often "sustained and reinforced by international economic relations that trap developing countries into dependence on a few raw material exports" (p. 15). Environmental scarcity may result in a number of negative social effects, such as reduced agricultural productivity, constrained economic productivity, migration, social segmentation, and disrupted institutions. The challenge, then, is for societies to use social and technical ingenuity so that they can adapt to these scarcities without undue hardship.

Homer-Dixon is indeed successful at drawing together many of the strands from the neo-Malthusian, economic optimist, and distributionist perspectives. In this multilayered work, he explores many relevant variables and synthesizes work from a number of research projects. It is a thoughtful and coherent treatment of a complex subject. Yet, there is one important variable that seems to be just barely visible in this analysis—the international system and the powerful actors that shape the system. It is important to consider these systemic issues, not only because of possible causal factors but also because of the extent to which systemic factors can constrain how individual countries adapt to resource scarcities.

Homer-Dixon focuses on the national and subnational levels, targeting how society is affected and how it responds. For example, in examining structural scarcity, he looks at the distribution of power and wealth within a society, but he does not address the distributional impact and structural scarcity resulting from the distribution of power and wealth within the international system itself. For him, its impact is limited to that of a reinforcing factor (p. 15).

He notes that the causes of environmental scarcity include "the size of the resource-consuming population, and the technologies and practices this population uses in its consumption behavior" (p. 14). Very often, factors outside of a society play a large role in determining how much cropland or water is available to support the local population. Almost all of the cases examined in this book are developing countries. Clearly, these are not the only societies experiencing environmental scarcity. But developed states can

generally exercise a broader array of options. In some cases, developed states avoid—or adapt to—resource scarcity not only because of social or technical ingenuity, but also because they have the economic and political power to use the resources of the developing countries. Consequently, when we look at a country's resource-consuming population, we have to consider the extent to which that population exists outside of the country's borders. This is a consideration not just for resource-surplus countries, but also for countries with significant resource deficits. Foreign ownership or control of land and the mandates of powerful global actors may contribute significantly to supply-induced and demand-induced scarcity. In some countries poor people go hungry, while arable land is used to provide food for livestock in distant lands, and while International Monetary Fund strictures limit government policy options.

In his examination of second-stage intervention, Homer-Dixon discusses how a society can use its indigenous resources more sensibly and provide alternative resources to people who have limited resource access. But global factors and external actors can also limit the extent to which developing countries can close the ingenuity gap. With the harmonization of intellectual property rights under the aegis of the World Trade Organization, technical and scientific information can become private property and therefore excludable knowledge. In the process, what is being privatized includes folk knowledge and genetic information. As powerful actors continue to appropriate knowledge and resources, the ingenuity gap might be more appropriately termed the wealth gap. Attempts to patent even the centuries-old knowledge of local communities can limit community options for adapting to scarcity.

Homer-Dixon is correct in stressing that "researchers need multivariate and complex theories and hypotheses" (p. 175) to explain multivariate and highly interactive ecological-political systems. But his discussion of environmental scarcity pays scant attention to an important set of variables—the international system and its powerful state and nonstate actors. Clearly, these actors do not provide the ultimate explanation for environmental scarcity, but they are more than reinforcing factors. Consequently, a focused examination of their role in this process should be a part of this "tool kit of concepts and generalizations" (p. 73) that is being offered to analysts and policymakers.

This criticism should not obscure the contributions made by Homer-Dixon's exploration of the links between environmental scarcity and conflict. It provides important insights into the social effects of environmental scarcity. His work in this area has led him to take a position that is congruent with the precautionary principle being encouraged in global environmental forums. He emphasizes that policymakers should focus on avoiding environmental scarcity, since they may not always be able to adapt to it. He cautions that it is unwise to assume that there will be an infinite fount of ingenuity adequate to address future scarcities.

U.S. Foreign Policy and the Iran Hostage Crisis By David Patrick Houghton. New York: Cambridge University Press, 2001. 270p. \$64.95 cloth, \$22.95 paper.

Marc Lynch, Williams College

David Patrick Houghton's U.S. Foreign Policy and the Iran Hostage Crisis explores the power of historical analogies in foreign policy decision making, offering along the way an engaging, thought-provoking account of decision making during the Iranian hostage crisis. Posing the question "How do decision makers reason when confronted by a problem which

seems almost entirely novel in character and therefore without precedent?" (p. 19), Houghton follows Khong's Analogies at War in arguing for the centrality of analogical reasoning. The seizure of the American embassy by Iranian student radicals presented a genuinely perplexing problem for decision makers on all sides, and Houghton captures their uncertainty well. Since decision makers can rely on different historical analogies, and even the same historical analogy can offer competing lessons or be subject to divergent interpretations, Houghton focuses attention upon the interpretive interplay of analogies. As the crisis unfolded, decision makers deliberated, directly and indirectly, over the most relevant and useful analogy. These analogies, according to Houghton, are not merely justifications for strategies chosen for other reasons but directly affect individual policy preferences by shaping beliefs about the nature of the problem. Houghton convincingly establishes the prevalence and power of historical analogies in shaping the response of policymakers to unfamiliar situations. His efforts to construct generalizable theoretical propositions about their relative causal weight are somewhat less successful but are consistently thought-provoking.

The strength of the book lies in the detailed reconstruction of American decision making surrounding the initial response to the embassy seizure, the weighing of competing options, and the approval of the rescue attempt. Drawing on interviews with members of the Carter administration, Houghton demonstrates the prevalence of historical analogies in discussions at all levels. American deliberations routinely appealed to a rich set of possible analogies—the Pueblo hostage crisis of 1968, the Mayaguez rescue of 1975, the Israeli Entebbe operation of 1976, and others. In the course of debating their relevance and their putative lessons, individuals often became attached to "their" analogy. While Houghton eschews judging "how reliable analogies are as a guide to the future, or whether the analogies could have been better used" (p. 39), the narrative suggests that the reliance on particular analogies clouded the judgment of the key policymakers, leading them to overstate the similarities of the situations and to underestimate crucial differences. Houghton's method of searching out and reporting every instance he can find of the use of analogies reveals little of the relative incidence of analogical reasoning as opposed to other forms of reasoning, however. The core concept of analogical reasoning remains elusive, as a wide variety of appeals to historical lessons or theory is counted as analogical reasoning. This makes it difficult to prove or to falsify assertions about relative importance, particularly when the outcome of the "war of analogies" is consistent with the strategies that would follow from other modes of reasoning (pp. 103, 105). It also makes it difficult to establish the causal significance of analogies. Houghton recognizes that the presence of analogies in the deliberations does not alone establish their causal weight. He tries valiantly to demonstrate that the analogies were not simply rhetorical gambits (pp. 157-65) and briefly considers a range of competing hypotheses (pp. 166-201), but the indeterminacy of the analogical theory makes it difficult to render definitive conclusions. Houghton's enthusiasm for analogies sometimes seems to lead him to misread his own evidence. For example, when the author presents the 1948-49 Angus Ward hostage situation as a possible analogy, Gary Sick responds, "We all learned about this well after the event...nobody was saying 'Aha! This is like such and such a case'" (p. 99). Nevertheless, Houghton spends several pages speculating about its possible relevance: Perhaps it is relevant, but this example raises questions about the falsifiability of the argument.

Houghton's treatment of the Iranian side, which draws on an archive of interviews with Iranians provided by a British documentary production rather than on personal interviews, is suggestive of the limitations as well as the strengths of the analogical research program. Chapter three makes abundantly clear that the 1953 historical experience, in which the CIA backed the Shah's coup against the nationalist Mohammed Mossadegh, decisively shaped the expectations and strategies of many Iranians in 1979. Exploring the ramifications of this analogy for Iranians allows a deeper understanding of Iranian behavior but risks deflecting analytical attention from internal power struggles in which the embassy seizure strengthened the hand of Iranian radicals against more moderate factions that sought compromise with the United States and a more liberal state at home. The decisive weight of an event that few of the student radicals experienced personally also raises questions about Houghton's conclusion that "American and Iranian decision makers...overwhelmingly drew upon the experiences and analogies known to them personally, reflecting the greater cognitive availability of these events" (p. 144). The dominance of the 1953 analogy suggests that cultural frames of reference, historical nationalist narratives, or prevailing discursive tropes might be more relevant than individual experience or cognitive differences. The limitations of the emphasis on individuals can also be seen in the American case, which focuses narrowly on individual decision makers and rarely considers how debates and historical analogies in the wider public sphere might have shaped their beliefs.

Houghton's presentation of the Iranian case repeatedly attempts to demonstrate that Iranian reliance on the 1953 analogy led them to misread American intentions: "Why did the student radicals ignore evidence—mostly rhetorical but apparently sincere—that the Carter administration was different [from past administrations]?" (p. 70). Houghton's evidence contradicts his framing of the puzzle, however. He wonders why Iranians failed to appreciate Carter's human rights discourse but then demonstrates that this human rights policy never applied to Iran (pp. 70–71). Houghton posits that the 1953 analogy led the Iranians to expect a coup that Carter would have never considered but then admits that Brzezinski, hardly a marginal player, did advocate a coup (pp. 69-70). He suggests that the paranoia of the student radicals about an American-backed coup derived from their misapplication of the 1953 analogy but then reports that "an Iranian team had been recruited by the CIA to assist the military operation in Tehran... who believed they were recruited for an anti-Khomeini operation which would serve as a prelude to a coup d'etat" (p. 122), as well as a secret meeting between Bazargan and Brzezinski (pp. 61-62). In this case, the search for analogical reasoning distracts attention from a quartercentury of active American support for the Shah that gave Iranians good reason to expect American counterrevolutionary action. This prioritizing of analogical reasoning can also be seen in the dismissal of the importance of the Soviet invasion of Afghanistan in shaping American strategies toward Iran (p. 110). Despite these problems, Houghton has written an interesting and thought-provoking book on an important subject that raises a number of compelling questions for future research.

The National Co-ordination of EU Policy: The Domestic Level Edited by Hussein Kassim, B. Guy Peters, and Vincent Wright. Oxford: Oxford University Press, 2000. 269p. \$72.00.

Maria Green Cowles, American University

In recent years, scholars of the European Union (EU) have looked increasingly at the impact—administrative, institutional, legal, societal—of European integration on the mem-

ber states. Some of this earlier literature on "Europeanization" viewed the Brussels-member state relationship in a rather static, one-way, top-down dimension. For this reason, the editors of *The National Co-ordination of EU Policy* take pains to eschew Europeanization as an organizing concept. But perhaps the editors doth protest too much. *The National Co-ordination of EU Policy*, in fact, fits nicely in the current literature on Europeanization, which views the Brussels-member state relationship in more dynamic terms. Indeed, the book provides a welcome and valuable addition by examining the *domestic coordination processes* through which "governments arrive at the position that they defend in EU decision making" (p. 235).

The book's editors—Hussein Kassim, B. Guy Peters, and the late Vincent Wright-argue in the introduction that the European Union places growing pressures on member states to coordinate their domestic responses to EU policymaking. The widening competence of the union, the increased salience of EU policy, and specific requirements, such as the council presidency and intergovernmental conferences (IGCs) pose increasing demands on member states to "get Europe right" (p. 3). At the same time, policy coordination at the domestic level is problematic in the face of an EU characterized by institutional fragmentation, sectorization, and weak connections across policy areas, among other factors. The editors argue that one might expect some form of homogenization or marked convergence among countries in terms of their national policy coordination. Yet despite the growing salience and complexity of the European Union, the book finds continuing divergence in the member states as national patterns of policy coordination persist.

How are government decisions on EU policies made at the domestic level in various EU member states? How is the coordination carried out among political leaders, competing national ministries, parliaments, regional units, and, in some cases, civil society? Who takes the lead in this coordination process? To what extent is this coordination perceived as necessary? These questions, implicit throughout the book, are examined in the empirical chapters.

This edited volume is particularly commendable in that the contributors' chapters focus not only on the "Big Three" (France, Germany, and the United Kingdom), but also include seven other EU member states (Italy, Spain, Portugal, Greece, Belgium, Austria, and Denmark). Moreover, many of the primary and secondary references come from non-Anglo-Saxon or Germanic sources. Thus, with the exception of the Italian chapter, readers are treated to detailed, in-depth analyses of national policy coordination processes in 10 EU countries.

Despite the richness of the individual chapters, *The National Co-ordination of EU Policy* is not as rigorous in terms of overall cohesiveness as it could be. The case studies, for example, do not address key concepts—European pressures, EU complexities, convergence/divergence—in a systematic way. And while recognizing that key players and ministries differ from country to country, the chapters fall short of addressing the various policy actors—prime ministers, parliaments, ministry officials, and so on—in an organized fashion. The same can be said about the case studies' examination of various types of policy responses, whether they be from Pillars I, II, or III of the European Union, or whether they involve everyday ("low politics") or historic ("high politics" or IGC) decisions.

The task of identifying the core concepts, key actors, and policy types across the book is left to the concluding chapter. Here, Hussein Kassim does an admirable job in summing up and, in some cases, expanding upon the arguments of the individual chapters. He identifies four general findings of the

book. The first is an assertion that the EU exerts tremendous pressure on member states to coordinate their national processes in response to EU policymaking. Exactly what these EU pressures are and how they differ from country to country is never fully fleshed out in the empirical chapters, however. The second finding is that national policy coordination has, in fact, changed in the face of these pressures. Again, evidence for this argument deserves more careful discussion. While this is clearly true in some case studies (notably France), it was not so apparent in others (Germany). The third findingthat there are "important similarities" in the manner in which member states coordinate their national responses—and the fourth finding—that institutional divergence persists—are thoughtfully elaborated. Here, the book's identification not only of the similarities and differences that exist but also why they exist is a particularly valuable contribution to the

It is interesting to note that this book assumes the reader has a strong grasp of both domestic and European/ international-level processes and policies. Thus, comparativists with little knowledge of the EU will find the discussion of administrative and institutional features across 10 countries fascinating, but may stumble when a contributor refers to Agenda 2000, the Delors White Paper, and the "communautaire vocabulary" with no further explanation. Likewise, international relations scholars familiar with developments in the EU may find it difficult to follow the detailed discussions of subcommittees within various ministries or the casual references to political spats among national officials. That the book is pitched to this level of expertise among its readership is not a criticism per se. Rather, The National Coordination of EU Policy sheds light on the growing challenge to scholarship of the EU today.

In the concluding paragraphs, Kassim points out this challenge in an all-too-brief but important discussion of the book's theoretical implications. Scholarship on the EU, historically dominated by international relations scholars, has often assumed a certain "symmetry between the member states" in terms of their form, structure, and interest (p. 259). Moreover, both classical and liberal intergovernmentalist theorists with their "over-organized concept of the state" have failed to adequately account for the formation of national policy positions. As this book makes clear, how member states organize and coordinate their national policy responses is critical to understanding the policy responses themselves. Citing Simon Bulmer's seminal 1983 article, Kassim reminds us that understanding how the EU functions requires not only an understanding of Brussels politics, but also a "knowledge of domestic systems...and an appreciation of the distinctiveness of national policies" (p. 259).

Redrawing the Global Economy: Elements of Integration and Fragmentation By Alice Landau. New York: Palgrave, 2000. 277p. \$70.00.

Karl Kaltenthaler, Rhodes College

Alice Landau explores the nexus between globalization and regionalization in the global economy in *Redrawing the Global Economy*. This means that she examines the ways in which national economies are being melded globally, while at the same time, those very same economies are creating regional economic blocs.

Landau's central argument is that both globalization and regionalization are leading to a growing gap in wealth between developed and developing countries and within countries as well. Not only are globalization and regionalization helping only the richer countries, or those with means in both sets of countries, but the processes are also leading to a great deal of discontent among many of those not involved in steering them. Thus, Landau paints a relatively dark picture of what globalization and regionalization mean for North-South relations and economic development prospects for low-income countries.

Landau's treatment of globalization and regionalization covers a great deal of theoretical and empirical territory. The first portion of the book assesses the various theoretical arguments that have been forwarded as to the causes and consequences of the globalization process. She divides the scholars who have written on this topic into "optimists" and "pessimists." The optimists are those who see globalization producing absolute economic gains for all involved. For the optimists, to stay out of the globalization process is to miss out on the opportunity to increase one's society's prosperity. The pessimists, on the other hand, bemoan the economic consequences of globalization, particularly how the process widens the income gap between rich and poor and how it ties economies together in a way that can precipitate global, rather than simply national, economic crises.

After surveying the literature, Landau sets out to explore the empirical picture of globalization and regionalization. Her intent is to describe these processes around the world. In doing so, she focuses on what globalization has done to state power, the patterns of global trade, the creation of new international organizations to manage the process, foreign direct investment, the power and operations of transnational corporations, and international financial markets.

In the chapter on what globalization has done to state power, Landau concludes that the picture is not completely clear. She asserts that states are not withering away across the world, but then again, some states have always been very weak. It is clear to her, however, that because there are so many political actors in the global economy, there is increasing confusion over policy authority in some parts of the world.

The chapter that explores how globalization has affected global trade argues that trade flows are increasingly stratified, both across countries and across sectors. Trade is increasing among the rich countries of world, while there has been less increase in trade between low-income countries and the rest of the world. Also, within countries, some dynamic sectors have become more integrated into the global economy, while others have not, leading them to fall behind economically.

Landau's chapter on international organizations is meant to assess whether the World Trade Organization (WTO) has fostered the inclusion of countries from across the globe into the global economy. She asserts that the WTO has had only mixed success. It has helped bring the richer countries further into the global economy, but it has failed to do much to help the developing economies. Thus, the WTO has only added to the globalization gap between rich and low-income countries

The chapter on foreign direct investment (FDI) mirrors the chapter on global trade patterns. FDI is concentrated in the wealthiest portion of the world; low-income countries have not been major contributors or recipients of FDI. As globalization has made it easier for FDI to flow around the world, it has only increased that pattern.

The chapter on the operations of multinationals in the global economy paints a picture that is very similar to that shown in the chapters on trade and FDI; globalization is producing a bifurcated world. Transnational corporations are much more active within the developed world than they are in the developing world. Thus, the economic and political links

that transnational corporations create are much stronger and deeper between the higher-income countries.

The final empirical chapter, which deals with international capital markets, makes the argument that there are very different patterns of capital flows within the developed and developing world. The increasing flows of capital around the world have been concentrated in the developed world. The low-income countries have made strides in accessing capital, but they are still minor recipients compared to high-income countries.

Landau's examination of regionalization, which is much briefer than that devoted to globalization, centers on patterns of regionalization and then on an assessment of whether regionalization is fostering or impeding globalization. She asserts in the two chapters on regionalization that this process is indeed on the rise, but it is not acting as an impediment to globalization. She concludes the book by essentially summarizing her findings and argument.

Redrawing the Global Economy is a solid, comprehensive treatment of the issue of globalization. The book is a wealth of information and a very good start for one exploring the process of globalization and its economic consequences. It is almost encyclopedic in its breadth of coverage of the topic of globalization.

The book does suffer from its comprehensiveness, however, because it tries to cover so much territory in terms of the aspects of the global economy, it gives a rather superficial treatment of the subject matter in some places. This is a book that is best used as an introduction to the globalization topic; it is not very well suited for those who are looking for a deep treatment of specific aspects of the globalization process.

I would recommend this book as a text for upper-level undergraduate and graduate students in courses in international political economy. The book is also useful to scholars who are not very familiar with the globalization process.

American Exceptionalism and US Foreign Policy: Public Diplomacy at the End of the Cold War By Siobhan McEvoy-Levy. New York: Palgrave, 2001. 256p. \$75.00.

Francis A. Beer, University of Colorado, Boulder

Public diplomacy, or foreign policy rhetoric, is an increasingly important dimension of international relations. As modern media extend their global reach, they bring national foreign policy actions out of the diplomatic closet into full public view. Public relations experts market foreign policy as they do other products and services. Foreign policy marketing uses rhetoric strategically to legitimize national actions, mobilize support from allies, and counter the propaganda efforts of opponents. McEvoy-Levy's work contributes to the growing literature of such modern international communication.

The author describes the way that rhetoric interacts with American exceptionalism. The genealogy of exceptionalism is embedded in American history, having its origins in the religious beliefs of the first European settlers. It traces its way forward through the rhetoric of President George Washington's warning about entangling alliances, the Monroe Doctrine and its various corollaries, and the doctrine of manifest destiny. It finally arrives at the beginning of the twenty-first century with America in its hegemonic moment as sole remaining superpower. In this vision, America is the city on the hill, defending good against evil, leading the world into the new day of peace and prosperity, globalization and democracy, toward the end of history and the new world order. This messianic rhetoric provides a powerful lever to consolidate

domestic support, appeal to shared values abroad, and escape unilaterally from the realist constraints of the international system.

The work's structure is logical and straightforward. It begins with a discussion of rhetoric and public diplomacy in international relations and foreign policy. It distinguishes between transitional and routine rhetoric, and discusses how rhetoric fits into standard models of foreign policymaking. Rhetoric infuses bureaucratic politics, incrementalism, organizational process, and agenda setting: Rhetoric gives voice to group and individual psychological dynamics. The next chapter discusses the history of the idea of American exceptionalism and the country's conception of its missionary role. In this context, rhetoric "reflects and constitutes the collective memory" (p. 43), communicates the collective national vision, and serves as an essential tool of international political mobilization.

There follows a detailed discussion of the rhetoric of several crises during the post–Cold War period. After the fall of the Berlin wall, American public diplomacy supported a policy that sought to move beyond containment, simultaneously expanding NATO and cooperative relations with the states of the former Soviet bloc, including Russia itself. In this process, the historical precedent of the U.S. Civil War served as a useful metaphor to support the "strategic rhetoric of reconstruction" (p. 70). This reconstruction had as its object both the larger international system and the states of the former Soviet Union.

During the Gulf War, the rhetoric of international community building again combined with references to past history. Metaphors from World War II were prominent, and Saddam Hussein morphed easily into Hitler. Vietnam became a powerful antimetaphor, a historical marker of American weakness, defeat, and decline that needed to be overcome. In this context, the rhetorical messages of the war became no-more-quagmires and America-is-back.

The immediate political tasks of the post-Cold War period and the military imperatives surrounding violence continued for the Clinton administration in the Balkans. At the same time, Clintonian rhetoric placed a new emphasis on international economic affairs. The metaphor of World War I had strong appeal, especially as it recalled the catalytic role of the Balkans in starting the unintended chain reaction. Further, the chaos that followed the harsh economic provisions of the Treaty of Versailles, unrestrained mercantilist competition, and hyperinflation had all contributed to the collapse of the interwar period. Clinton's rhetoric of reconstruction thus expanded to embrace further post-Soviet normalization and to support such initiatives as the creation of the National Economic Council and the National Service program, the North American Free Trade Association, the expansion of the World Trade Organization, and critical international economic rescue operations.

The rhetoric of American exceptionalism has framed American policy throughout the post–Cold War period. The "city on a hill," the "redeemer nation," "renewal through self-flagellation," and the "manifest destiny" of building international community and world order have been recurrent themes in American public diplomacy. Political leaders have used these themes strategically as they sought to build "sympathetic public ecologies," to recreate the American nation, and to advance an international program of "soft hegemony" (pp. 146–64). Although the author does not venture into this territory, these themes also sketch a doctrinal outline of what might be called American civil religion at the heart of American culture.

McEvoy-Levy does a good job of describing the significance of political rhetoric and identifying major rhetorical themes during the post–Cold War period. She shows the importance of metaphors of prior international events, particularly American wars, in framing current affairs. Her work also recapitulates elements of an earlier debate between realism and idealism. She describes clearly how American idealist impulses are formulated rhetorically and used for important political purposes within the context of an environment that can also be described in realist terms.

In the world politics of the twenty-first century, the programs of soft and hard power coalesce and reinforce each other. The political rhetoric of public diplomacy is part of a postrealist struggle for interpretation and meaning. The current War on Terrorism, for hearts and minds, on the air and on the ground, is the latest chapter, yet to be written, of this ongoing project.

**Arms and Ethnic Conflict** By John Sislin and Frederic S. Pearson. Lanham, MP: Rowman & Littlefield, 2001. 224p. \$65 cloth, \$25.95 paper.

Jeffrey T. Checkel, Universitetet i Oslo

John Sislin and Frederic Pearson have written a fine book that addresses a complex and understudied issue: the role of arms in ethnic conflict. While it is abundantly clear that arms and ethnic conflict are closely intertwined, we have little systematic knowledge on the nature of the relation. What kinds of weapons—tanks versus small arms, say—play the greatest role? Whatever the weapon, how does its influence vary at different stages in the process of ethnic conflict? As unpleasant as the thought might be, are there conditions under which armaments play a positive role in such conflicts—for example, by promoting a situation of stalemate or bringing about outside humanitarian intervention? The signal contribution of this compact volume is to shed much-needed light on these and many other questions.

This is not a book for those who prefer simple answers. Instead, the authors carefully sift through rich data sets to offer contingent, bounded arguments on the role(s) played by arms. Put differently, this is not an argument where a single independent variable goes forth and slays all others; rather, the emphasis is on how constellations of factors—arms one among them—interact under certain conditions to lead to the escalation or de-escalation of ethnic conflict. This kind of nuanced analysis allows the authors to tease out a number of important policy implications in an excellent concluding chapter.

The structure of the book reflects these ambitions. The authors begin by highlighting our lack of rigorous knowledge on the arms/ethnic-conflict nexus (Chapter 1) and then proceed to survey and assess the armaments and armsflow data upon which they rely (Chapter 2). The latter is a model of methodological caution, carefully assessing the drawbacks of various data sources—be they United Nations' registries, official government reports, or journalistic accounts

It is the next three chapters, however, that comprise the book's core. Addressing the role of arms in the onset, progression, and resolution of ethnic conflicts, each chapter is built upon a solid combination of narrative stories and broader, large-n analysis. Not only does this make for a smoother read in a stylistic sense; it also—and more importantly—increases confidence in the validity of the volume's findings. The authors thus often use a particular narrative to uncover a possible relation—say, that infusions of heavy arms lead to greater volatility in the escalatory/de-escalatory patterns of ethnic conflict—that is then tested against the larger set of cases

All this said, there are limitations to the analysis, with theoretical concerns most primary. Simply put, the book offers little that is new theoretically. Perhaps this is inevitable in a volume that so self-consciously and carefully emphasizes methodological and data issues. And to be fair, the authors themselves say up front that "[g]enerally we proceed from existing conflict theory, deriving logical expectations and then testing them to the extent possible" (Preface, p. xiv). The book therefore pulls existing theory off the shelf, as it were, and tests it. Fair enough.

Problems arise, however, when the authors uncritically accept the core assumptions on which those theories are built. Integrating a methodologically individualist view of actors with fixed properties and a rational choice theory of action, much of this work reduces ethnic conflict to the strategic machinations of opportunistic agents who carefully calculate costs and benefits. What is wrong with this? Absolutely nothing! Empirically, we have abundant evidence that such dynamics drive a good deal of ethnic conflict, with individuals opportunistically invoking ethnicity in the pursuit of political

At the same time, it strains credulity to believe that ethnic agents really do know the content of their utility functions and actually have sufficient information available to engage in intelligent cost/benefit calculations—assumptions made throughout the book under review (pp. 5, 46, 88, 121, for example). If most of us have trouble doing any of this on a daily basis, why should we assume that individuals in violent and possibly life-threatening situations will do any better? This discussion matters because the authors claim to be offering policy-relevant theory and analysis (Preface, Chapter 6). Yet if these assumptions do not always hold (p. 140, n. 5, for example), how credible and reliable are the policy prescriptions?

Given these facts, the book would have been that much stronger if alternative perspectives and assumptions on ethnic conflict were introduced and tested. Here, the starting point would be that such conflict is an inherently social phenomenon. What role, then, do social norms play in creating the in- and out-groups essential for the activization of ethnic identity markers? More important given the volume's analytic goals, how does an influx of armaments disrupt, change, or destabilize this group socialization process? What is going on when, in certain cases, ethnic actors do not seek arms despite incentives and opportunities to do so?

To ask and answer such questions suggests the utility of social constructivist perspectives for exploring the arms/ethnic-conflict relation. The point of introducing and testing such arguments would be to help the authors delimit their claims. Are there certain conditions under which it does make sense to view ethnic conflict—and the role of armaments in it—as being driven by utility-maximizing, strategic agents? Equally important, are there other conditions when it does not make sense? If such a research design were pursued, the beneficial end result would not be an argument of the "either/or" type—either rational choice or social constructivism—but of the "both/and" sort. In turn, this would help Sislin and Pearson advance a more robust and complete set of policy prescriptions.

My criticisms here need to be kept in context. Arms and Ethnic Conflict is a very good book that is judicious in its use of data, cautious in its claims, and of relevance to policymakers as well as scholars. One can only hope that the volume inspires scholars of a sociological and social constructivist orientation to build upon it, developing a more complete set of hypotheses that can be fit together in integrative ways in order for us to understand more fully the role of armaments in ethnic conflict.

The Theory and Practice of Third World Solidarity By Darryl C. Thomas. Westport, CT: Praeger Publishers, 2001. 324p. \$57.95.

Howard P. Lehman, University of Utah

Since the end of the Cold War, development studies have fallen to the wayside as attention has shifted to the democratization process in Eastern Europe, the increased integration of the European Union, and the effects of economic globalization in the advanced industrialized countries. The developing world was seen as an afterthought or, in some cases, as arenas of misunderstandable ethnic or religious conflict, structural poverty, disease, and other hardships. However, in the context of September 11, more attention now is on the developing world, perhaps not so much on economic development, but more on containing various terrorist organizations. Yet development studies still exist, and this area of study maintains an historical connection to several decades worth of academic research. Scholars persistently ask such questions as why the South is poor and politically weak compared to countries in the North. Answers generally are located in the dependency literature of unequal economic relations leading to unequal power relations. Darryl C. Thomas, in The Theory and Practice of Third World Solidarity, asks this question but provides a somewhat different response. The economic and political inequality in the world is not necessarily due to economic ideology but to the color of skin (p. xi). The solidarity of the Third World that Thomas sees in the past is one based on race, and racial solidarity should be the means by which the poor and powerless of the Third World transform unequal power relations. Thomas refers to this relationship as global apartheid, defining it as a structure of the world system that combines political economy and racial antagonism (p. 26). He states that global apartheid refers to the continuation of white-minority dominance of political, social, legal, cultural, and economic decision-making apparatuses within the world system (p. 111) and that this form of racial capitalism has become a permanent feature in the world system.

The major focus of the book thus is a chronological review of the evolution of racial solidarity of the Third World and the nonalignment movement. An early chapter presents the case that the Third World historically has sought to respond to global apartheid. Thomas asks, to what extent has the Third World been successful in transforming the structures of global apartheid since the end of the World War II? To what extent has the pan-pigmentationalist dimension of Third World solidarity brought about changes in the global racial order? (p. 27). To answer these questions, he draws on an historical review of the nonalignment movement during the Afro-Asian coalition of the 1950s, the more extensive solidarity during the 1960s, the Cold War, and briefly the current phase of globalization. He argues that the nonaligned movement was successful in forging a dynamic alliance among its members to challenge the North-South divide (p. 80). He claims that the newly emerging nations from Asia, Africa, and the Caribbean rejected alliances and military pacts with the Great Powers. These neophytes sought to promote peace because they believed that only through international peace could their aspirations and needs be fulfilled (p. 76).

During the Cold War, Third World solidarity became fragmented as global apartheid continued its hold over the world system. Thomas points to the divisive effects of high oil prices, the growth of newly industrializing countries, and the division between some Third World countries seeking economic integration and those following economic self-reliance. By the late 1980s, he argues, the old orthodoxy of development being guided by the state was being replaced by a new orthodoxy. Increasingly, developing countries are now focusing on building a market economy, creating a hospitable environment for private capital, closing the state out of the economic arena, and opening their political system to democracy (p. 176). Since the end of the Cold War and the rise of globalization, the forces of globalization are increasing the gap between the North and the South as Third World states are losing control over their domestic economic and financial policies (p. 235). Third World solidarity is increasingly on the defensive, Thomas claims, as global capitalism is not being challenged. He argues that with the retreat of the Soviet bloc, the former USSR has turned its back on anti-imperialism (p. 241). Thomas concludes his study by claiming that it may take the unfolding battle throughout the developing world for racial dignity and political and economic democracy to shake the foundation of the emerging regime of global apartheid and develop a new base of solidarity that focuses on the political, economic, racial, and military dimensions of global inequality (p. 274).

This important book focuses not just on the political and economic inequalities between the North and the South, but also on the racial dimension of these inequalities. The majority of people in the North are white and the majority of the people in the South are nonwhite. Yet the book does not present a cohesive theoretical argument concerning the link between race and capitalism. For one thing, the author relies more on a descriptive account of this relationship and less on a theoretical analysis of race and class. Second, the nonalignment movement was a crucial feature of the independence movement of the 1950s and 1960s. Yet it never developed into a powerful counterforce against the superpowers. In many ways, the nonalignment movement was a misnomer since so many of its members did indeed side with one superpower or the other in military alliances. Third, the effects of the newly industrializing countries on the nonalignment movement need to be further analyzed. Were these countries an aberration within the global apartheid or were they a model of how Third World countries could establish themselves within global capitalism? Fourth, Third World solidarity seems to be presented in this study as a monolithic concept.

Yet international solidarity based on race has never materialized. Instead, we have seen a rise of regional institutions in the developing world that attempt to protect the interests of member states. NAFTA, Asia Pacific Economic Cooperation (APEC), the East African Community, and the Economic Community of West African States (ECOWAS) are examples of regional solidarity. Finally, the book offers very little in terms of solidarity in the post-Cold War era. In some ways, the argument falters in the discussion of racial solidarity during this period. There is an absence of significant analysis of how the recent waves of democratization, human rights, and peace making efforts fit into the argument of global apartheid. Can Third World solidarity form around these emerging democracies? In what way has globalization affected Third World solidarity? This book raises many important questions, answers some, and leaves others unaddressed.

Perfect Deterrence By Frank C. Zagare and D. Marc Kilgour. Cambridge: Cambridge University Press, 2000. 441p. \$74.95 cloth, \$27.95 paper.

Michael D. McGinnis, Indiana University

For too long, nuclear deterrence theory has been treated as a casualty of the end of the Cold War. During the preceding period of superpower rivalry, debates over the credibility of nuclear deterrence attracted the attention of sophisticated game theorists in diverse disciplines. But with the end of the Cold War, this research tradition virtually ground to a halt. In this important new book, two long-term contributors to this body of research revisit these issues and effectively recast these models as representations of policy dilemmas of long-standing and continuing relevance. For instance, their models of U.S. strategic doctrines of massive retaliation and flexible response prove relevant to any situation in which the parties perceive two levels of conflict to be significantly different, even if neither level involves the use of nuclear weapons.

The book begins with a brief overview of two variants of classical deterrence theory. Whereas the first, structural version embraces the high levels of survivable deterrent forces needed to sustain Mutual Assured Destruction, writers in the second decision-theoretic strand treat superpower crises as Chicken games in which neither player could rationally initiate a full nuclear exchange. Standard models of both variants suffer, Zagare and Kilgour argue, from significant shortcomings, either in terms of logical consistency or empirical verisimilitude. In their view, effective deterrents must be both capable of causing harm to the target and credible in the sense of being cost-effective to carry out, should the occasion for doing actually arise.

The authors carefully work through a series of interrelated models, each focused on one particular form of deterrence. One sequence of models deals with asymmetric (or unilateral) deterrence, in which only one state is presumed to be interested in challenging the status quo. Another series deals with situations of mutual deterrence, in which both states attempt to deter the other from initiating a challenge. In all cases, simple models of complete information are used to illustrate the range of possible behaviors expected to occur under different equilibrium conditions, followed by more complex, and more realistic, models of incomplete information in which one or both players remain unsure of the credibility of the other state's deterrent threat. Part II focuses on direct deterrence, in which one state seeks to convince a second state not to initiate a change in the status quo. Part III deals with situations of extended deterrence, in which the first state extends its protection to a third state, an effort which necessarily compounds the problem of credibility. (Some models are also interpreted in terms of power transition theory.) Each chapter concludes with a "coda" recapitulating the major points covered in that chapter, and the book concludes with an overview of the argument as a whole.

Zagare and Kilgour are to be commended for their sustained effort to draw out the implications of a few variations on basic models. They present complex results clearly. Multiple equilibrium conditions are organized into categories illustrated by easily interpretable figures and distinguished by distinct labels (although by the end of the book, these labels do tend to run together). By relegating formal proofs to 70 pages of appendices, the authors maintain a clear focus in the text on the most important results. Notation is clear and

consistent, making it easy to directly compare equilibrium conditions for different models. Throughout the book, each set of findings is illustrated with appropriate examples, drawn from a wide array of historical eras.

The word *perfect* in the book's title refers to the condition that all equilibria must be subgame perfect, meaning that no threat can be based on actions that would be irrational to carry out, even at decision nodes that the players will not reach if both play their equilibrium strategies. This refinement has become the standard formal representation of the requirement that rational deterrents cannot be backed up with noncredible threats. As the authors demonstrate, however, many possible behaviors can be consistent with this criterion, in different sets of circumstances.

One of the most intriguing specific findings concerns the conditions under which a no-first use policy might have been, in some parameter configurations, sustainable as equilibrium (p. 238). In general, Zagare and Kilgour demonstrate that deterrence provides, at best, a fragile foundation for peace. In nearly all of the parameter configurations they investigate, any possible equilibrium supporting the status quo is associated with another closely related equilibrium in which some challenges do occur that may end in war (p. 293).

Rarely does any one formal modeler agree with all of the assumptions imposed by another modeler. In this case, I was concerned to see that in their simplest model of "generalized mutual deterrence" (pp. 70-81), two players select C or D simultaneously, after which a C player may choose to retaliate for a play of D. I understand the authors' reasons for setting it up this way, but it still strikes me as an uneasy hybrid between single-play and repeated game representations. For this and later, more complex models, the authors might have investigated the implications of requiring their equilibria to satisfy refinements beyond subgame perfection. Also, in some of the later models, a first-strike advantage might have been introduced in order to distinguish different paths to all-out war. Still, the authors justify each of their simplifications, and they hedge their conclusions accordingly. Overall, they have selected well, in the sense that their simplifications facilitate clear presentations and interpretations of their most impor-

By focusing on their own models, the authors leave open many avenues for later elaborations upon similar themes. For example, each crisis is treated here as a separate event, even though the authors presume that a state's level of credibility may vary according to the location or the salience of that particular crisis. Thus, later researchers might incorporate these specific models of individual crises into a broader, macrolevel model of rivalry. No one should expect that nuclear deterrence theory will ever regain its earlier position of prominence, but Zagare and Kilgour remind us that now, more than a decade after the end of the Cold War, important subtleties remain hidden within the logic of deterrence.

- Arend Lijphart

"An immense treasure of American electoral data"

— Helmut Norpo

A Statistical History of the American Electorate adds a new, never explored dimension to the study of the nation's political system. Rusk has examined thousands of pieces of information and masses of historical and contemporary numerical data on elections to draw a new picture of our evolving voting ways and byways. His book adds immeasurably to the abundant literature about actual results and voting returns from specific elections by gathering data over time-200 years-and casting it into historical patterns. The material in each of his eight chapters is introduced with an essay that explains the data and its importance, and sets it all in context. Chapters include: Election Laws and Suffrage; Voting Participation; Presidential, House, Senate, and Gubernatorial Voting; and Measures of Voting Behavior.

# The Essential Stankiewicz

### On the Importance of Political Theory

The Essential Stankiewicz contains a selection from a lifetime of writing by one of the most eminent

political philosophers of our time.

For Stankiewicz, the main concern of political philosophy is "to establish principles relevant to the public good and to uphold the tradition of the public philosophy of civility." According to Stankiewicz the ills of society emanate from relativist liberalism and are reflected in such phenomena as the pursuit of group rights, antiauthority stances, the emergence of identity politics and the irrationalism of political correctness.

### A timely reminder that the mind of a neo-classical political theorist is at work.

"His critique of liberalism is insightful, often devastating and always offered as a part of a larger philosophic framework." — ALAN C. CAIRNS

### **Black Pride and Black Prejudice**

Paul M. Sniderman and Thomas Piazza

Do "black pride" and "black prejudice" come hand in hand? Does taking pride in being black encourage the rejection of a common bond with other Americans?

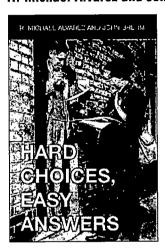

In this groundbreaking study, Paul Sniderman and Thomas Piazza probe these questions in the only way possible—by asking black Americans. They show that African Americans overwhelmingly reject racial separatism and embrace a common framework, culture, and identity with other Americans.

Values, Information, and American Public Opinion R. Michael Alvarez and John Brehm

Michael Alvarez and John Brehm develop a new theory of response variability that, by reconciling the strengths and weaknesses of the standard approaches, will help pollsters and scholars alike better resolve such perennial problems.

### The Claims of Culture

Equality and Diversity in the Global Era **Sevia Benhabib** 

How can liberal democracy best be realized in a world fraught with conflicting new forms of identity politics and intensifying conflicts over culture? This book brings unparalleled clarity to the contemporary debate over this question. Seyla Benhabib challenges the assumption that cultures are clearly defined wholes. She presents an alternative approach, developing an understanding of cultures as continually creating, re-creating, and renegotiating the imagined boundaries between "us" and "them."

### **Managing the President's Program**

Presidential Leadership and Legislative Policy Formulation **Andrew Rudalevige** 

The belief that U.S. presidents' legislative policy formation has centralized over time is shared by many who have studied the American presidency. Drawing on transaction cost theory, Andrew Rudalevige constructs a framework of "contingent centralization". to predict when presidents will use White House and/or new departmental staff resources for policy formulation. He backs his assertions through a quantitative analysis of a new data set of policy proposals covering almost fifty years of the postwar era.

# Locke and the Legislative Point of View

Toleration, Contested Principles, and the Law **Alex Tuckness** 

Determining which moral principles should guide political action is a vexing question in political theory. This is especially true when faced with the "toleration paradox": believing that something is morally wrong but also believing that it is wrong to suppress it. Alex Tuckness argues that John Locke's potential contribution to this debate-what Tuckness terms the "legislative point of view"—has long been obscured by overemphasis on his doctrine of consent. According to Tuckness, Locke suggests an

approach to political justification that is a provocative alternative to the utilitarian, contractualist, and perfectionist approaches dominating contemporary liberalism.

The Gideon Edition

Edited by George W. Carey and James McClellan

"A high-quality, scholarly edition for a great price."

-Library Journal, October 2001

Written and published in newspapers in 1787 and 1788 to explain and promote ratification of the proposed Constitution for the United States, which were then bound by the Articles of Confederation, *The Federalist* remains of singular importance to students of liberty around the world. Liberty Fund presents the Gideon Edition of *The Federalist*, published in 1818, which includes the responses prepared by Madison to the previously published McLean edition of 1810, presenting *The Federalist* texts as corrected by Hamilton, but not by Madison. The Liberty Fund *Federalist* also includes a new introduction, a Reader's Guide outlining—section by section—the arguments of *The Federalist*, a glossary, and ten appendixes, including the Declaration of Independence, the Articles of Confederation, the Virginia Resolution Proposing the Annapolis Convention, and other key documents leading up to the transmission of the Constitution to the governors of the several states. Finally, the Constitution of the United States and Amendments is given, with marginal cross-references to the pertinent passages in *The Federalist* that address, argue for, or comment upon the specific term, phrase, section, or article of the Constitution.

# RESTORATION OF THE REPUBLIC

The Jeffersonian Ideal in 21st-Century America

### **Gary Hart**

"Politics corrupted by money and special interests.
Citizens alienated from government. Much talk of rights, little mention of civic duty. This is the picture

of a republic gone astray, according to Thomas Jefferson, who made citizen engagement and authentic democracy the focus of his mature political philosophy. In these pages, Gary Hart takes up questions Jefferson raised 200 years ago, and applies them to America today. He has written a timely, bracing book."

The Silent Surrender of Public Responsibility

### Neil Gilbert

"Neil Gilbert's *Transformation of the Welfare State* has the following virtues: it is based on a deep study of comparative welfare systems: it distinguish-

es between actual welfare tendencies and desirable utopian ambitions; it carries forward the long tradition of social decencies in the treatment of basic human needs. In other words, Gilbert's work is down the middle ideologically and straight arrow intellectually."

Public Reasoning about the Ends of Policy

### Henry S. Richardson

"In Democratic Autonomy Richardson applies his important work about deliberative practical reasoning and the 'specification of ends' to a major problem in democratic theory and practice: How can a modern society that must depend on the expertise

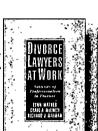

of administrative agencies still be a democracy, characterized by genuine self-rule? Written in a clear and accessible style, the book should be required reading, not only for theorists of democracy and public choice, but also for policy makers and legislators."

"George Marcus deserves thanks and praise for reminding us that emotional communication and arousal are the life-blood of politics. ### **Notes from the Editor**

Because I spend so much time reviewing potential APSR articles, it pains me to admit what is undeniably true: that a great deal of the important intellectual work in our discipline comes packaged not as journal articles, but as books. Many disciplines help their members stay abreast of new books in their field by maintaining "official" single-purpose book review journals. In political science, this function has long been performed by the APSR, which despite its name is primarily an outlet for research, not for reviews. That long-standing arrangement is about to change, for book reviews will bid farewell to the APSR after the current issue. Hereafter, the book review section, which has occupied approximately one-third of our pages, will migrate to the APSA's new journal, Perspectives on Politics, where it will reappear in volume 1, number 1, in March 2003. Gone from the APSR but not forgotten will be the invaluable contributions made by book review co-editors Susan Bickford and Gregory McAvoy, the long line of APSR book review editors who preceded them, and, of course, the thousands of scholars who over the years have taken on the thankless (and often cursed at) task of writing book reviews for the APSR. The APSR, sans book reviews, will continue to be published on a quarterly basis, but beginning in 2003, our new cover dates will be February, May, August, and November.

Beginning in 2003, PS, the APSA's "other" periodical, will also shift to a new schedule, appearing in January, April, July, and October. Included in its January issue will be a copy of my first annual editorial report, which was presented to the APSA Executive Council at the annual meeting in Boston. Editorial reports are usually pretty dull. Mine may be, too (though naturally I don't think so), but in light of the attention, much of it critical, that the APSR has attracted in recent years, I think you will find this particular report to be of special interest. I hereby call it to your attention and express the hope that after reading it you will pass along any thoughts you may wish to share; please direct these to apsr@gwu.edu.

#### IN THIS ISSUE

The orange cover of this issue completes our annual cycle of the color palette. Next year and for the foreseeable future, the same red, green, blue, orange progression will be repeated. Still changing from issue to issue will be the cover graphic, which we will continue to key to the theme of the first article in the issue.

To find a cover graphic that is somehow linked to the first article in an issue and is also interesting to look at, I rely on the scholarly expertise and aesthetic sense of Rob Hauck, the APSA's deputy executive director and a highly accomplished artist as well. To present the theme of Robert Lieberman's "Ideas, Institutions, and Political Order: Explaining Political Change," this issue's graphic features gears (standing for change),

turning wheels (representing ideas), and the meshing of the gears (representing structure)—a set of identifiable, concrete objects that cohere conceptually, signifying the broad thrust of Lieberman's essay. In recent years, debates have raged about the relative roles of "ideas" and "institutions" in explaining political change. Lieberman acknowledges both the strengths and the weaknesses of each approach, and sets for himself the daunting task of melding the two into a viable new synthesis. Then, rather than leaving the stage after making the case for a synthetic approach, he uses it as a framework for analyzing shifts in civil rights laws and policy in the United States. This application not only concretizes Lieberman's abstract argument, but also does much to illuminate U.S. "race policy" during the 1960s.

The next article in this issue also operates on a high conceptual plane, considering substantive and epistemological issues of broad disciplinary and interdisciplinary interest. In the search for useful ways to understand the political influences of "culture," political scientists have borrowed heavily from disciplines as diverse as literature and economics. Rarely, though, have they returned to first principles and devoted the necessary effort to fleshing out their understanding of culture. In "Conceptualizing Culture: Possibilities for Political Science," Lisa Wedeen suggests that this inattention may be the primary reason why the study of culture in political science has become so divided. Wedeen offers a more fully theorized understanding of culture that holds out promise for solidifying research in this booming area of political analysis.

The next two articles could hardly be more different in approach, but share the very same substantive focus. Their common focus is one of the Big Issues of democratic governance: representation, and more specifically the representation of minorities. Overshadowed by the debate between "descriptive" versus "substantive" representation and purposefully disregarded by advocates of the former lurks the question of what characteristics of representatives are most likely to advance the interests of disadvantaged groups. Suzanne Dovi tackles this question head-on in "Preferable Descriptive Representatives: Or, Will Just Any Woman, Black, or Latino Do?" Dovi argues that well-intentioned and seemingly sound reasons for not articulating desirable criteria for descriptive choices are ultimately outweighed by the need for such criteria. She goes on to endorse a criterion that she claims will foster mutual understanding between descriptive representatives and their constituents. Are you convinced by Dovi's argument? No matter how you answer this question, Dovi's analysis should significantly sharpen your understanding of the issues swirling around the concept of descriptive representation.

This emphasis on the representation of minorities is sustained in Eyal Baharad and Shmuel Nitzan's "Ameliorating Majority Decisiveness through Expression of Notes from the Editor December 2002

Preference Intensity." The issue with which Baharad and Nitzan are concerned arises from the fact that in a simple pairwise voting system, the majority's preference will always prevail, no matter what the minority prefers or how intensely it prefers it. Might voting rules be devised that would ameliorate majority decisiveness and yet be unbiased (anonymous and neutral)? By bringing the tools of formal modeling to bear on this question, Baharad and Nitzan provide a closely reasoned answer to that question—an answer that has some fascinating implications for the way elections are conducted.

In the three remaining articles in this issue, the focus shifts from abstract conceptual and "large-M" methodological issues in political analysis (as in the contributions by Lieberman and Wedeen) and enduring Big Issues of democratic politics (as in the Dovi and Baharad-Nitzan articles) to some nitty-gritty aspects of the political process in the United States. The idea guiding Ethan Bueno de Mesquita and Matthew Stephenson's "Precedent as a Response to the Complexity of Legal Communication," is that our understanding of the courts would be greatly enhanced by a better sense of how judges at different levels of the judicial system communicate with and learn from one another. Taking this as their cue, Bueno de Mesquita and Stephenson build a model that clarifies when, why, and how precedent shapes judicial decisions. Although exercises of this type are sometimes seen as so stylized as to be empirically sterile, Bueno de Mesquita and Stephenson's model enables them to reconcile some seemingly contradictory observations that have long puzzled observers of the courts and to speak to an array of important and divisive issues concerning judicial decisionmaking.

Speaking of "important and decisive": The series of decisions handed down by the U.S. Supreme Court in the early 1960s in cases involving legislative apportionment surely fit that description. In the wake of those decisions, a wave of research concluded that the imposition of the "one person-one vote" standard had brought about little or no change in the distribution of spending across legislative districts. That conclusion was disturbing, for it implied that an apportionment standard that emphasized equality in representation left policy outcomes largely unchanged from a time when some constituencies were grossly overrepresented and others had little voice in legislative decisions. In "Equal Votes, Equal Money: Court-Ordered Redistricting and the Distribution of Public Expenditures in the American States," Stephen Ansolabehere, Alan Gerber, and James Snyder use a comprehensive dataset on state expenditures before and after redistricting to revisit the connection between representation and expenditures. Their results provide a foundation for a new interpretation of the utility of equal apportionment criteria and serve as a prime example of how rigorous political science research can speak to important and enduring policy issues.

As I compose these notes, debate rages about whether the United States ought to initiate military action in Iraq. Often noted has been the irony that

whereas many leaders of the American military leaders are taking a cautious approach to such action, much pressure to initiate action is being placed on the president by advisors who themselves have not served in the military (the so-called "chicken hawks"). Precisely this irony, as it has played out over the course of American history, is the subject of Chriustopher Gelpi and Peter D. Feaver's "Speak Softly and Carry a Big Stick? Veterans in the Political Elite and the American Use of Force." Is it possible that decisionmakers with a military background have actually served as a force for the peaceful resolution of international conflicts involving the U.S.? Thus stated, the question is too simple, for it ignores the distinction between decisions to initiate militarized disputes in the first place and decisions about the level of force the U.S. uses in the disputes it initiates. Gelpi and Feaver use this distinction to structure their analysis of U.S. involvement in more than a hundred international disputes over the course of two centuries. The result is a fascinating set of conclusions about an often-overlooked set of influences on foreign policy decisionmaking.

#### **INSTRUCTIONS TO CONTRIBUTORS**

#### **General Considerations**

The APSR strives to publish scholarly research of exceptional merit, focusing on important issues and demonstrating the highest standards of excellence in conceptualization, exposition, methodology, and craftsmanship. Because the APSR reaches a diverse audience of scholars and practitioners, authors must demonstrate how their analysis illuminates a significant research problem, or answers an important research question, of general interest in political science. For the same reason, authors must strive for a presentation that will be understandable to as many scholars as possible, consistent with the nature of their material.

The APSR publishes original work. Therefore, authors should not submit articles containing tables, figures, or substantial amounts of text that have already been published or are forthcoming in other places, or that have been included in other manuscripts submitted for review to book publishers or periodicals (including on-line journals). In many such cases, subsequent publication of this material would violate the copyright of the other publisher. The APSR also does not consider papers that are currently under review by other journals or duplicate or overlap with parts of larger manuscripts that have been submitted to other publishers (including publishers of both books and periodicals). Submission of manuscripts substantially similar to those submitted or published elsewhere, or as part of a book or other larger work, is also strongly discouraged. If you have any questions about whether these policies apply in your particular case, you should discuss any such publications related to a submission in a cover letter to the Editor. You should also notify the Editor of any related submissions to other publishers, whether for book or periodical publication, that occur while a manuscript is under review by the APSR and which would fall within the scope of this policy. The Editor may request copies of related publications.

If your manuscript contains quantitative evidence and analysis, you should describe your procedures in sufficient detail to permit reviewers to understand and evaluate what has been done and, in the event that the article is accepted for publication, to permit other scholars to carry out similar analyses on other data sets. For example, for surveys, at the least, sampling procedures, response rates, and question wordings should be given; you should calculate response rates according to one of the standard formulas given by the American Association for Public Opinion Research, Standard Definitions: Final Dispositions of Case Codes and Outcome Rates for RDD Telephone Surveys and In-Person Household Surveys (Ann Arbor, MI: AAPOR, 1998). This document is available on the Internet at <a href="http://www.aapor.org/ethics/stddef.html">http://www.aapor.org/ethics/stddef.html</a>. For experiments, provide full descriptions of experimental protocols, methods of subject recruitment and selection, subject payments and debriefing procedures. and so on. Articles should be self-contained, so you should not simply refer readers to other publications for descriptions of these basic research procedures.

Please indicate variables included in statistical analyses by capitalizing the first letter in the variable name and italicizing the entire variable name the first time each is mentioned in the text. You should also use the same names for variables in text and tables and, wherever possible, should avoid the use of acronyms and computer abbreviations when discussing variables in the text. All variables appearing in tables should have been mentioned in the text and the reason for their inclusion discussed.

As part of the review process, you may be asked to submit additional documentation if procedures are not sufficiently clear; the review process works most efficiently if such information is given in the initial submission. If you advise readers that additional information is available, you should submit printed copies of that information with the manuscript. If the amount of this supplementary information is extensive, please inquire about alternate procedures.

The APSR uses a double-blind review process. You should follow the guidelines for preparing anonymous copies in the Specific Procedures section below.

Manuscripts that are largely or entirely critiques or commentaries on previously published APSR articles will be reviewed using the same general procedures as for other manuscripts, with one exception. In addition to the usual number of reviewers, such manuscripts will also be sent to the scholar(s) whose work is being criticized, in the same anonymous form that they are sent to reviewers. Comments from the original author(s) to the Editor will be invited as a supplement to the advice of reviewers. This notice to the original author(s) is intended (1) to encourage review of the details of analyses or research procedures that might escape the notice of disinterested reviewers; (2) to enable prompt publication of critiques by supplying criticized authors with early notice of their existence and, therefore, more

adequate time to reply; and (3) as a courtesy to criticized authors. If you submit such a manuscript, you should therefore send as many additional copies of their manuscripts as will be required for this purpose.

Manuscripts being submitted for publication should be sent to Lee Sigelman, Editor, American Political Science Review, Department of Political Science, The George Washington University, 2201 G Street N.W., Room 507, Washington, DC 20052. Correspondence concerning manuscripts under review may be sent to the same address or e-mailed to apsr@gwu.edu.

#### **Manuscript Formatting**

Manuscripts should not be longer than 45 pages including text, all tables and figures, notes, references, and appendices. This page size guideline is based on the U.S. standard  $8.5 \times 11$ -inch paper; if you are submitting a manuscript printed on longer paper, you must adjust accordingly. The font size must be at least 11 points for all parts of the paper, including notes and references. The entire paper, including notes and references, must be double-spaced, with the sole exception of tables for which double-spacing would require a second page otherwise not needed. All pages should be numbered in one sequence, and text should be formatted using a normal single column no wider than 6.5 inches, as is typical for manuscripts (rather than the double-column format of the published version of the APSR), and printed on one side of the page only. Include an abstract of no more than 150 words. The APSR style of embedded citations should be used, and there must be a separate list of references at the end of the manuscript. Do not use notes for simple citations. These specifications are designed to make it easier for reviewers to read and evaluate papers. Papers not adhering to these guidelines are subject to being rejected without review.

For submission and review purposes, you may place footnotes at the bottom of the pages instead of using endnotes, and you may locate tables and figures (on separate pages and only one to a page) approximately where they fall in the text. However, manuscripts accepted for publication must be submitted with endnotes, and with tables and figures on separate pages at the back of the manuscript with standard indications of text placement, e.g., [Table 3 about here]. In deciding how to format your initial submission, please consider the necessity of making these changes if your paper is accepted. If your paper is accepted for publication, you will also be required to submit camera-ready copy of graphs or other types of figures. Instructions will be provided.

For specific formatting style of citations and references, please refer to articles in the most recent issue of the APSR. For unusual style or formatting issues, you should consult the latest edition of *The Chicago Manual of Style*. For review purposes, citations and references need not be in specific APSR format, although some generally accepted format should be used, and all citation and reference information should be provided.

Notes from the Editor December 2002

#### **Specific Procedures**

Please follow these specific procedures for submission:

1. You are invited to submit a list of scholars who would be appropriate reviewers of your manuscript. The Editor will refer to this list in selecting reviewers, though there obviously can be no guarantee that those you suggest will actually be chosen. Do not list anyone who has already commented on your paper or an earlier version of it, or any of your current or recent collaborators, institutional colleagues, mentors, students, or close friends.

2. Submit five copies of manuscripts and a diskette containing a pdf file of the anonymous version of the manuscript. If you cannot save the manuscript as a pdf, just send in the diskette with the word-processed version. Please ensure that the paper and diskette versions you submit are identical; the diskette version should be of the anonymous copy (see below). Please review all pages of all copies to make sure that all copies contain all tables, figures, appendices, and bibliography mentioned in the manuscript and that all pages are legible. Label the diskette clearly with the (first) author's name and the title of the manuscript (in abridged form if need be), and identify the word processing program and operating system.

3. To comply with the APSR's procedure of doubleblind peer reviews, only one of the five copies submitted should be fully identified as to authorship and four should be in anonymous format.

- 4. For anonymous copies, if it is important to the development of the paper that your previous publications be cited, please do this in a way that does not make the authorship of the submitted paper obvious. This is usually most easily accomplished by referring to yourself in the third person and including normal references to the work cited in the list of references. In no circumstances should your prior publications be included in the bibliography in their normal alphabetical location but with your name deleted. Assuming that text references to your previous work are in the third person, you should include full citations as usual in the bibliography. Please discuss the use of other procedures to render manuscripts anonymous with the Editor prior to submission. You should not thank colleagues in notes or elsewhere in the body of the paper or mention institution names, web page addresses, or other potentially identifying information. All acknowledgments must appear on the title page of the identified copy only. Manuscripts that are judged not anonymous will not be reviewed.
- 5. The first page of the four anonymous copies should contain only the title and an abstract of no more than 150 words. The first page of the identified copy should contain (a) the name, academic rank, institutional affiliation, and con-

tact information (mailing address, telephone, fax, e-mail address) for all authors; (b) in the case of multiple authors, an indication of the author who will receive correspondence; (c) any relevant citations to your previous work that have been omitted from the anonymous copies; and (d) acknowledgments, including the names of anyone who has provided comments on the manuscript. If the identified copy contains any unique references or is worded differently in any way, please mark this copy with "Contains author citations" at the top of the first page.

No copies of submitted manuscripts can be returned.

#### **ELECTRONIC ACCESS TO THE APSR**

Back issues of the APSR are available in several electronic formats and through several vendors. Except for the last three years (as an annually "moving wall"), back issues of the APSR beginning with Volume 1, Number 1 (November 1906), are available on-line through JSTOR (http://wwwjstor.org/). At present, JSTOR's complete journal collection is available only via institutional subscription, e.g., through many college and university libraries. For APSA members who do not have access to an institutional subscription to JSTOR, individual subscriptions to its APSR content are available. Please contact Member Services at APSA for further information, including annual subscription fees.

Individual members of the American Political Science Association can access recent issues of the APSR and PS through the APSA website (www.apsanet.org) with their username and password. Individual nonmember access to the online edition will also be available, but only through institutions that hold either a print-plus-electronic subscription or an electronic-only subscription, provided the institution has registered and activated its online subscription.

Full text access to current issues of both the APSR and PS is also available on-line by library subscription from a number of database vendors. Currently, these include University Microfilms Inc. (UMI) (via its CD-ROMs General Periodicals Online and Social Science Index and the on-line database ProQuest Direct), Online Computer Library Center (OCLC) (through its on-line database First Search as well as on CD-ROMs and magnetic tape), and the Information Access Company (IAC) (through its products Expanded Academic Index, InfoTrac, and several on-line services [see below]). Others may be added from time to time.

The APSR is also available on databases through six online services: Datastar (Datastar), Business Library (Dow Jones), Cognito (IAC), Encarta Online Library (IAC), IAC Business (Dialog), and Newsearch (Dialog).

The editorial office of the APSR is not involved in the subscription process to either JSTOR for back issues or the other vendors for current issues. Please contact

APSA, your reference librarian, or the database vendor for further information about availability.

# EXPEDITING REQUESTS FOR COPYING APSR AND PS ARTICLES FOR CLASS USE AND OTHER PURPOSES

#### **Class Use**

The Comprehensive Publisher Photocopy Agreement between APSA and the Copyright Clearance Center

(CCC) permits bookstores and copy centers to receive expedited clearance to copy articles from the APSR and PS in compliance with the Association's policies and applicable fees. The general fee for articles is 75 cents per copy. However, current Association policy levies no fee for the first 10 copies of a printed artide, whether in course packs or on reserve. Smaller classes that rely heavily on articles (i.e., upper-level undergraduate and graduate classes) can take advantage of this provision, and faculty ordering 10 or fewer course packs should bring it to the attention of course pack providers. APSA policy also permits free use of the electronic library reserve, with no limit on the number of students who can access the electronic reserve. Both large and small classes that rely on these articles can take advantage of this provision. The CCC's address, telephone, and fax are 222 Rosewood Drive, Danvers, MA 01923, (978) 750-8400 (voice), and (978) 750-4474 (fax). This agreement pertains only to the reproduction and distribution of APSA materials as hard copies (e.g., photocopies, microfilm, and microfiche).

The Association of American Publishers (AAP) has created a standardized form for college faculty to submit to a copy center or bookstore to request copyrighted material for course packs. The form is available through the CCC, which will handle copyright permissions.

APSA also has a separate agreement pertaining to CCC's Academic E-Reserve Service. This agreement allows electronic access for students and instructors of a designated class at a designated institution for a specified article or set of articles in electronic format. Access is by password for the duration of a class.

Please contact your librarian, the CCC, or the APSA Reprints Department for further information.

#### **APSR** Authors

If you are the author of an APSR article, you may use your article in course packs or other printed materials without payment of royalty fees and you may post it at personal or institutional web sites as long as the APSA copyright notice is included.

#### Other Uses of APSA-Copyrighted Materials

For any further copyright issues, please contact the APSA Reprints Department.

### Ideas, Institutions, and Political Order: Explaining Political Change

ROBERT C. LIEBERMAN Columbia University

Institutional approaches to explaining political phenomena suffer from three common limitations: reductionism, reliance on exogenous factors, and excessive emphasis on order and structure. Ideational approaches to political explanation, while often more sensitive to change and agency, largely exhibit the same shortcomings. In particular, both perspectives share an emphasis on discerning and explaining patterns of ordered regularity in politics, making it hard to explain important episodes of political change. Relaxing this emphasis on order and viewing politics as situated in multiple and not necessarily equilibrated order suggests a way of synthesizing institutional and ideational approaches and developing more convincing accounts of political change. In this view, change arises out of "friction" among mismatched institutional and ideational patterns. An account of American civil rights policy in the 1960s and 1970s, which is not amenable to either straightforward institutional or ideational explanation, demonstrates the advantages of the approach.

s the time neared midnight on 10 June 1964, Everett Dirksen took the floor of the United States Senate to conclude three months of debate on the Civil Rights Act. "It is said that on the night he died," Dirksen said, "Victor Hugo wrote in his diary substantially this sentiment: 'Stronger than all the armies is an idea whose time has come.' The time has come," he went on, "for equality of opportunity in sharing in government, in education, and in employment. It will not be stayed or denied. It is here" (Congressional Record 1964, 13319; Whalen and Whalen 1985, 185, 198). Surely equality of opportunity for all races was an idea of its time in the United States in 1964, well past due according to many. But what made that particular night the moment when this idea arrived, to be entered finally into the nation's lawbooks by vote of a venerable legislative body that had long resisted it? Many things beyond the force of the idea itself conspired to make this idea arrive at that place at that time: a broad and vigorous social movement espousing it, political parties increasingly divided by it and consumed with it, and political institutions that were able to help its advocates build and sustain a coalition around it. How did these things contribute to the triumph of the liberal ideal of equal rights? As John Kingdon (1984, 1) asks, "What makes an idea's time come?"

Long dormant in the systematic study of politics, ideas have staged a remarkable comeback in the social sciences in the last 15 years or so. Indeed, the challenge of "bringing ideas back in" to political science and political explanation is one of the central issues now facing the discipline. There are a number of reasons

that we have arrived at this pass. First, developments in world politics brought ideas onto center stage. The end of the Cold War, the collapse of communism, and the convergence of the world's economic and political institutions on a new neoliberal paradigm, among other broad shifts, signaled a profound ideological transformation in much of the world. Never mind that the social sciences utterly failed to predict these phenomena; without reference to the ideological nature of these transformations, the new world of the twenty-first century seems unfathomable and the pathways by which it arrived incomprehensible (see Anderson n.d.).

Second, prevailing institutional approaches in political science are limited in their capacity to account for the substantive course of politics. Given the raw material—assumptions about actors' beliefs, preferences, knowledge, understandings, and expectations institutional theories can effectively derive predictions about which outcome from among a range of contemplated outcomes is likely to occur. But precisely because material approaches tend to take these things as given, they are at something of a loss to explain the appearance at any given moment of any particular menu of substantive choices. In the case of the Civil Rights Act, for example, institutional theories can explain why, given the emergence of civil rights as a salient issue, Congress acted as it did. They can even explain why the American political system at midcentury was particularly susceptible to the appeals of the civil rights movement. But they cannot account for the substantive content of civil rights demands, or of the beliefs and understandings that led actors to connect these demands with a particular set of policy solutions. Ideas, many analysts argue, can fill this explanatory gap. After all, they constitute much of the substantive raw material upon which institutional theory feedsthe goals and desires that people bring to the political world and, hence, the ways they define and express their interests; the meanings, interpretations, and judgments they attach to events and conditions; and their beliefs about cause-and-effect relationships in the political world and, hence, their expectations about how others will respond to their own behavior. To the extent that these and other things that go on in people's heads are not simply a function of something else in

Robert C. Lieberman is Associate Professor of Political Science and Public Affairs, Department of Political Science, Columbia University, 420 West 118th Street, New York, NY 10027 (RCL15@COLUMBIA.EDU).

The author thanks the Russell Sage Foundation, the German Marshall Fund of the United States, and the Lyndon Baines Johnson Foundation for financial support and Sheri Berman, Mark Blyth, Bob Jervis, Ira Katznelson, Lauren Osborne, Sven Steinmo, and the editor and anonymous reviewers for their helpful advice.

<sup>&</sup>lt;sup>1</sup> The Hugo quotation is actually a paraphrase of a passage from his historical essay, *Histoire d'un crime: Déposition d'un témoin*, his vicious account of Louis Napoleon's coup d'état of 1851. The passage reads, "On résiste à l'invasion des armées; on ne résiste pas à l'invasion des idées" ["The invasion of armies can be resisted; the invasion of ideas cannot be resisted"] (Hugo 1987, 456).

the political world, institutional and interest-based approaches will tell only a part of the causal story of many significant political phenomena (Berman 1998, 16–19).

With these limitations in mind, scholars studying the role of ideas in politics have offered a bracing challenge to material perspectives on a number of grounds. Ideational approaches challenge the reductionism of much institutional theory, which often assumes away any complexity in the substance of politics, as in spatial models of voting or legislative behavior that collapse political disputes typically to a single dimension (Black 1958; Downs 1957; Krehbiel 1988; Poole and Rosenthal 1997). Ideas in politics, by contrast, are often complex and multidimensional. Ideational accounts of politics also challenge the tendency of institutional theories to take the interests and aims of political actors as given, whether they are determined by individual rationality, group affiliation, or cultural patterns. Rather, actors' understanding of their own interests is apt to evolve as the ideological setting of politics changes. More generally, ideational theories seem to challenge the institutional emphasis on structure, aggregate organizational or behavioral regularities, as the principal guiding force behind political behavior. A focus on ideas suggests, rather, the possibility that human agency can defy the constraints of political and social structures and create new political possibilities (Smith 1992).

These challenges zero in on the central shortcomings of institutional theories of politics. Although each brand of institutionalism has its own blind spots, in their broadest outlines they share these characteristicsreductionism, the exogeneity of certain fundamental elements of political life, and a privileging of structure over agency. Above all, institutional theories share an emphasis on finding order and stability, comprehensiveness and coherence, patterns and models that elucidate more or less general propositions about a class of political phenomena. Because of their emphasis on eliciting ordered patterns and regularities from observations about politics, institutional theories in general run into trouble in accounting for political change; How, after all, can we explain change in outcomes by reference to stable causes? Any search for the sources of change in this sort of explanatory scenario inevitably leads to a problem of infinite regress: To explain a change in some familiar state of affairs, we must assume an antecedent change in one or more causal factors that were previously part of a stable system. But after making this move we are left with the same problem: What caused this antecedent change, if not some change farther back in the causal chain? At some point in this sequence, the source of change must come from outside the system.

It is one of my contentions that these same dilemmas—problems of reductionism, exogeneity, and structure envy—ironically bedevil much ideational political analysis, contrary to common presumptions and the self-professed aims of many ideational theorists who define their enterprise as a counterweight to these particular sins of institutional analysis. Above all ideational and institutional accounts share the focus on ordered regularity that makes problems of change particularly intractable for both camps. It is certainly

true that ideational accounts are often more sensitive to change than institutional ones; ideas, after all, are a medium by which people can imagine a state of affairs other than the status quo and such imaginings might plausibly spur them to act to try and make changes. But ideas alone do not create the incentives or opportunities for action, and not all holders of alternative political ideas act on them. Moreover, ideational accounts of political change typically chronicle shifts from one ideational equilibrium to another.

There is no particular shame in these faults; they are the necessary elements of theory building and generalization that distinguish social science from the description of singular slices of human experience. Nevertheless, this set of analytical moves, common to both theoretical schools, comes at some cost. In particular, what Karen Orren and Stephen Skowronek (1994) have called the "iconography of order," the quest to find coherent synchronous patterns—equilibria—in political life, often leaves political scientists scratching their heads when asked to account for political change.<sup>2</sup>

I suggest further that by substantially relaxing the common focus on order that both sets of approaches share, we can make progress in accommodating the two perspectives. That is, an analytic perspective that considers both institutions and ideas as integral, endogenous explanatory elements, without privileging one or the other, can go some distance in avoiding these traps. In particular, analysis that takes both ideas and institutions seriously will almost of necessity shed light on points of friction, irregularities, and discontinuities that drive political change. These discontinuities between separately constituted patterns of institutions and ideas can lead to a reformulation of the incentives and opportunities facing political actors and produce largescale political change that neither institutions nor ideas, considered independently, can explain. There are, to be sure, analytical costs to this approach, particularly the parsimony and clear foundations that often characterize institutional models of politics. But there are corresponding analytical gains, particularly the ability to account for major political change, that make these costs worth paying. After elaborating this critique of both institutional and ideational theories I sketch the outlines of a synthesis and illustrate its possibilities with an example taken from the development of civil rights policy in the United States.

# IDEAS AND INSTITUTIONS: COMMON CHALLENGES

A variety of institutional perspectives has come to occupy, it is fair to say, the ascendant position in the theoretical pantheon of political science. There is, of course,

<sup>&</sup>lt;sup>2</sup> By "order" I refer not to the orderliness of societies and government—what Samuel Huntington (1968, 1) defined as qualities of "consensus, community, legitimacy, organization, effectiveness, [and] stability"—but rather to the recognition of patterned regularity in social and political life. Some major works of social science have focused precisely on finding order among great moments of societal disorder, such as revolutions, as in the work of Barrington Moore (1966) and Theda Skocpol (1979).

a variety of "new institutionalisms" in political science (and the social sciences more generally), rooted in a variety of methodological and disciplinary approaches, from neoclassical microeconomics and the theory of games to macrohistorical sociology to the sociology of organizations and culture (Campbell and Pedersen 2001a; Hall and Taylor 1996; Immergut 1998; Powell and DiMaggio 1991; Thelen and Steinmo 1992). Although these perspectives differ in significant ways, they share a common set of concerns and assumptions, particularly an interest in the way in which some set of regularities in political life (rules and procedures, organizational structures, norms, cultural scripts) shapes the expression and aggregation of political preferences, allocates power and regulates its exercise, and therefore affects political outcomes (Immergut 1998).

Another characteristic these perspectives share is a tendency to relegate ideas, however they are conceived, to the sidelines in explanatory accounts of political processes (see, e.g., Berman 1998, 14–24, and Hall 1997). One extreme version of this view holds that ideas are epiphenomenal, simply consequences of material (or structural or institutional) arrangements. This view is most clearly associated with certain versions of Marxism, but it also appears in non-Marxist variants. In such cases, expressions of ideas in a political setting might be taken not as genuine articulations of beliefs or understanding but as strategic manipulation or position taking aimed at advancing an interest or pursuing a goal that is deemed to be fundamental (see, e.g., Mayhew 1974).

Even in cases where the analysis is not quite so doggedly materialist, ideas are seen as exogenous to the more fundamental explanatory framework. Ideas often make an appearance in institutional analyses, where they serve the purpose of patching over lacunae in the basic explanation. This move has become somewhat common in rational-choice institutionalism, where ideas operate as focal points that help solve game-theoretic models with multiple equilibria (Bates, de Figueiredo, and Weingast 1998; Garrett and Weingast 1993). Ideas are unquestionably important to such analyses, but not ideas as ideas—that is, their content, valence, and intensity are less important than the role they play in a causal tableau. Ideas work in such instances merely as devices to untangle the knotty problems of institutional models; something else entering from the wings would do just as well. More generally, as Mark Blyth (1997, 231) has observed, "Ideas in such treatments are ultimately secondary to the mode of analysis in which they are employed. Their definition, operationalization, and explanatory power are simply derivative of the wider theory in which they are embedded." Although they might be important to particular explanations, ideas when adduced in this way do not fundamentally alter the institutionalist enterprise.

Such moves also ignore commonplace readings of history, in which ideas often appear as the prime movers of history. Prominent accounts of the American (Bailyn 1967; Wood 1969) and French (Sewell 1985) Revolutions, for example, have put ideas at the cen-

ter of causal accounts of tumultuous political change. Nor do they fully capture political developments that involve basic conflicts and transformations among political ideas and values. Such developments span the spectrum of substantive concerns in political science: the rise of Keynesianism and its eclipse by neoliberalism (Campbell and Pedersen 2001b; Hall 1989, 1993), the triumph of color-blind liberal integrationism in the United States over a history of race-conscious oppression (King 2000; Smith 1997), and the emergence of international norms of multilateralism and human rights out of Cold War realism (Risse, Ropp, and Sikkink 1999; Sikkink 1993). If institutionalism wants to remain relevant in political science, it must prove itself able to account convincingly for these changes that manifest themselves not simply in new policies but in fundamentally new ideological bases for politics.

The challenge for institutional approaches, therefore, is to find a way to treat ideas as analytically consequential in accounts of political action, policy development, and institutional change, and to do so without falling into the characteristic traps that I have outlined—particularly the ad hockery with which institutional accounts usually appropriate ideas as explanatory factors. But this must also be done in a way that retains the essential strengths of institutionalism in all its varieties: its accounts of strategic behavior by purposive agents under structural constraints, of the aggregation of interests, of the distribution and exercise of power, and of the social construction of political rationality—and its ability to combine and recombine these elements and mobilize them into convincing causal explanations of a wide range of political phenomena, from the presidential veto (Cameron 2000) and the political control of the bureaucracy (McCubbins, Noll, and Weingast 1987) to social revolutions (Skocpol 1979), industrial policies (Dobbin 1994), lawmaking under separated powers (Krehbiel 1998), and welfare states (Pierson 1994; Skocpol 1992). Our synthesis should recognize, in other words, that ideas are not simply tools in the hands of power-seeking strategic agents (although they can be and often are) (Campbell 1998).

While institutional approaches labor under these difficulties in trying to assimilate ideas, ideational explanations share many of the same blinders. Again, these difficulties take more and less extreme forms. At the far extreme are accounts that posit a single, overwhelming, and, above all, stable set of ideas as the driving force in politics (see, e.g., Geertz 1964 and Hartz 1955). In such accounts it is the substance of ideas that matters above all in shaping political outcomes, whether they are coherent, logical, internally consistent, and thus influential; the causal mechanisms that drive this influence inhere in the ideas themselves. While such an approach is admittedly rare in the rationalist world of the social sciences, functional explanations of politics often ascribe this role to political ideas; modernization theory, which ascribes great importance to the logical, functional connections among the components of political systems, is a prominent example (Almond and Coleman 1960; Inglehart 1997).

More common are studies that emphasize political ideas as central causal factors but give short shrift to the political settings in which ideas become influential and to the causal mechanisms that influence the selection among ideas in concrete political choices (Berman 2001). In his magisterial survey of the multiple political traditions that have challenged liberalism for ascendancy in American politics, for example, Rogers Smith (1997) places his bets squarely on ideational factors, the interplay of three clusters of ideas about national membership and civic identity, as the central factor in shaping American citizenship laws and American political development more generally. Smith (1993, 1997) brilliantly parses the ideological currents that found expression in American citizenship and immigration policy and effectively challenges the view of American culture as thoroughly suffused with egalitarian liberalism that has held sway from Tocqueville through Louis Hartz and beyond (see also King 1973). These ideological traditions do not stand alone in Smith's work; like a mirror image of institutional accounts that rely on ideas as catalytic but not constitutive, his account presents evidence about the institutional settings in which ideas are enacted as policy—courts, legislatures, administrative agencies, and the like. But these settings are exogenous to his theoretical framework; they appear conveniently as stage-setters for his interpretive enterprise but they do not fundamentally change the theoretical approach, limiting somewhat his theory's capacity to explain the particular sequence of outcomes he charts (Orren 1996a, 1996b; Smith 1996, 1999). As Smith (1999, 25) himself notes,

Conducive conditions are...not enough to explain outcomes. To grasp how and why early American political actors combined liberal, republican, racist, and sexist ideas and institutions, we must go beyond a Hartzian focus on their initial material and intellectual circumstances and attend to their central political tasks. Those tasks were not, first and foremost, the carrying on of any particular tradition, although many early Americans identified with historical figures who defended personal liberties and championed republican governments. American leaders were most immediately concerned with using available traditions first to mobilize support for the Revolution, then to build a successful new nation, and finally to maintain and extend it in various ways.

More precisely, these broad political projects posed particular political challenges to these actors, who had to negotiate a distinctive and shifting institutional universe to implement them. They had to pass laws, defend those laws against legal challenges, and administer them according to particular institutional rules and logics that were not necessarily connected to (or in synch with) the ideas these policies embody. These patterns surely affected the sequence and substance of the outcomes Smith charts by placing power in certain hands at certain moments, privileging certain interests over others, and creating moments of opportunity for politicians to act, whether out of strategic or ideological or some combination of motives (Kingdon 1984; Mayhew 2000). These features of the political landscape are not absent from his account, but they do not carry independent explanatory weight and he does not assimilate their effects systematically into his framework.

Just as ideas are not merely strategic tools, political ideas are not free-floating bits of knowledge and conjecture, detached from considerations of structure and power, that rise and fall according to the functional logic of the marketplace (to borrow Oliver Wendell Holmes Jr.'s metaphor) or of natural selection (Abrams v. United States 1919, 630–31; Mill, On Liberty, chap. 2). Part of understanding political development and institutional change is understanding which ideas win (or, in fact, which ideas are in the arena to begin with), why, and with what consequences for whom. The important point is not only where ideas come from or how they cohere or collide but also how they come to be prominent, important, and powerful, even determinative in shaping political behavior and defining political rationality. As Sheri Berman (2001, 233) writes, "Political scientists must be able to explain . . . why some of the innumerable ideas in circulation achieve prominence in the political realm at particular moments and others not. Since no intellectual vacuum ever exists, what is really at issue here is ideational change, how individuals, groups, or societies exchange old ideas for new ones." These exchange processes, it is clear, occur at the intersection of ideas and institutions, and any fully convincing theory of political or institutional change must incorporate both as constituent elements with reasonably equal weights.

### ORDER, DISORDER, AND POLITICAL CHANGE

The most important limitation on the capacity of both institutional and ideational approaches to come to grips with processes of change is their common emphasis on ordered, patterned regularity. It is this emphasis, after all, that distinguishes social science from other modes of inquiry into human experience—the search for general patterns of behavior and interaction.<sup>3</sup> This emphasis on order leads, as Karen Orren and Stephen Skowronek (1994, 1996, 1999) argue, to a view of political development that consists of periods of stability and coherence, of "politics as usual," punctuated by moments of extraordinary, even transformative change, after which things settle back down into a reformulated pattern of ordinariness (see Baumgartner and Jones 1993 and Carmines and Stimson 1989). Each brand of institutionalism lends itself to this view: Rational choice, with its emphasis on equilibrium and its methodology of comparative statics; historical institutionalism, with its focus on periodization and regimes;

<sup>&</sup>lt;sup>3</sup> This minimalist definition of social science is intended to be a thoroughly catholic one. I do not mean to endorse a vision of social science that depends on the discovery of Hempelian covering laws that govern human behavior across time and space, nor do I mean to exclude interpretive modes of inquiry such as Geertz's (1973) notion of "thick description," which, although it does not endorse generalization across cultural milieus, nevertheless hews to an idea of understanding human societies by discerning regular patterns of interaction and signification among their members (Merton 1949; Zuckerman 1997).

and sociological institutionalism, with its account of taken-for-granted cultural meanings and scripts that underlie action. Although ideational theories are often more attuned to change, they too tend to emphasize order and regularity. Ideas do not appear willy-nilly in ideational accounts; rather, they appear in settled, ordered configurations that serve to organize some reasonably broad aspect of political life over some span of time, whether as all-encompassing ideologies or as what Berman (1998, 21–22) calls "programmatic beliefs" (see also Eckstein 1988).

Both institutional and ideational approaches thus exhibit something of a bias toward finding and explaining stability in political arrangements. Each set of approaches has developed sophisticated tools for making causal inferences about the effects of stable, recurring patterns on political outcomes. This bias, however, poses a problem when we are confronted with significant political change. From a perspective that emphasizes stability and relegates things that do not fit the pattern to the background, the sources of important change almost necessarily appear to be exogenous, the result of some sort of shock of unknown origin that may or may not be assimilable by the prevailing order. What we are after is an explanation not of ordinary predictable variation in outcomes but of extraordinary change, where relationships among explanatory factors themselves change.

To put the matter in more analytical terms, consider a simple model of some political phenomenon:

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \varepsilon. \tag{1}$$

Although the explanatory factors,  $X_1$  and  $X_2$ , vary, the model describes a stable pattern of relationships between these factors and the outcome, Y; when  $X_1$  or  $X_2$  varies by a certain amount, Y changes by a predictable amount, as described by the parameters,  $\beta_1$  and  $\beta_2$ . Anything we do not observe or cannot measure or consider unnecessary to explain the outcome is bundled in the error term,  $\varepsilon$ . This model describes a stable pattern, and we can test its explanatory power by observing variation on the independent variables and comparing the model's predictions with actual states of the world under a variety of conditions. But consider that, for some reason, the pattern changes, requiring a new model to describe the same phenomenon:

$$Y = \beta_3 + \beta_4 X_1 + \beta_5 X_2 + \varepsilon. \tag{2}$$

This model describes a new set of stable regularities, in which the variables are the same but the relationships among them are different—we have new parameters,  $\beta_4$  and  $\beta_5$ , in place of the original ones. Now we have useful models of two situations, before and after some transformative change that has altered not just the conditions that produce some outcome (what I describe above as ordinary variation) but the very causal process at work in producing the outcome (extraordinary change).<sup>4</sup> We might even have a description of whatever happened at the moment of transformation from

(1) to (2). What we do not have is an account of how and why the world changed; there is nothing in the stable patterns of variation in model (1) that can provide a causal story about the emergence of model (2). Any explanation we might be able to mount for this change would have to be exogenous to model (1), based on something that was simply relegated to the error term, since model (1)'s parameters ( $\beta_1$  and  $\beta_2$ ) are constant.<sup>5</sup>

What all of this abstract symbolism is meant to suggest is that the only source of explanatory power to account for significant political change—change that goes beyond the bounds of ordinary variation—is the error term, the detritus of the normal model of political affairs. These are the things that, as noted above, are considered irrelevant or unnecessary to a model of political order or else too wispy or ethereal to be the focus of systematic explanation. This is true, in general, of both institutional and ideational models that focus on ordered patterns in the political world. To explain the move from one set of institutions to another, we need reference to something exogenous to an institutional model of the initial state of affairs; likewise for a shift from one ideational pattern to another. The question is how to develop models of politics that can account for such substantial episodes without recourse to such ad hoc exogenous factors—in other words, how, if possible, to endogenize multiple ordered patterns, whether based on institutions or ideas, in a single type of explanatory framework that can help explain how apparently stable institutional and ideological patterns can change quite dramatically. There are limits, of course. Not everything that happens in the political world is predictable and consequential things happen that are quite simply beyond the reach of any reasonable model—singular events such as assassinations, for example. Thus we cannot hope to endogenize everything. Nevertheless, there does not seem to be any a priori reason why both ideas and institutions, neither of which has such singular character, cannot both be incorporated into reasonable, tractable models of politics.

One way out of this bind is to relax the emphasis on order and regularity in modeling politics. The alternative need not be chaos. Rather, we can consider that any political moment or episode or outcome is situated within a *variety* of ordered institutional and ideological patterns, each with its own origins and history and each with its own logic and pace (Orren and Skowronek 1994, 1996). These patterns, it is often metaphorically said, "take on lives of their own"; that is, they come to structure and delimit political interests, understandings, and behavior independently of other factors that might also be important. It is common in

<sup>&</sup>lt;sup>4</sup> For simplicity's sake, I have not considered the possibility that some new variable,  $X_3$ , may have entered the mix in the transition from

<sup>(1)</sup> to (2). This eventuality, however, would not change the fundamental point and would in fact deepen the conundrum that I am illustrating.

<sup>&</sup>lt;sup>5</sup> I offer this stylized example not to suggest, as some have (King, Keohane, and Verba 1994), that the statistical reasoning represented therein is any kind of gold standard for social scientific inference but rather to demonstrate the distinction I am making between explaining stability and explaining change and to point to the need for more configurative models of politics that embrace a multiplicity of causal elements (Katznelson 1997).

both institutional and ideational analysis to conceive of political order in holistic terms. A political "order," in this mode, is a regular, predictable, and interconnected pattern of institutional and ideological arrangements that structures political life in a given place at a given time—"a durable mode of organizing and exercising political power...with distinct institutions, policies, and discourses," as David Plotke (1996, 1) defines it (see also Skowronek 1993). Such an order might have multiple institutional and ideological components, which shape and constrain political action by providing incentives, opportunities, and grounds for legitimation to political actors. An important presumption behind this approach is that a political "order" is internally coherent. This definition implies that the effects of the component parts are cumulative and mutually reinforcing, that they generally point most actors in the same (or at least complementary) directions most of the time. (This is not to say there is no conflict, only that conflicts are fundamentally stable and predictable and tend to be contained and resolved within the normal political processes that constitute the order in question according to generally agreed upon or conventionally understood rules and expectations.) As an analytical strategy for explaining political outcomes, this approach presumes that other factors are not consequential enough to create sufficiently strong incentives for actors to deviate from what appear to be the "normal" workings of

There is no reason to presume, however, that the ideological and institutional currents that prevail at any given time or place are necessarily connected with each other in any coherent or functional way. This is true for a number of reasons. First, political arrangements are rarely, if ever, the products of a coherent, total vision of politics that informs institutions and ideas and knits them together into a unified whole (and even in times and places that approach this extreme—revolutionary France, the Soviet Union, Nazi Germany—politics remains subject to multiple, discordant forces). Rather, they are inevitably the products of compromise, partial and circumscribed, incoherent and jury-rigged, rarely if ever sweeping away the detritus of a previous order to construct a new one. New policies, institutional arrangements, or ideological paradigms thus do not replace the old but are layered atop prior patterns, creating what Jeffrey Tulis (1987, 17-18) has called a "layered text." Second, such arrangements are often the products of some past event, so that while institutions, policies, or sets of ideas might have arisen in response to particular historical circumstances, they often outlast the conditions that led to their creation and may persist despite being dysfunctional (North 1990). Consequently the ideological and institutional orders that prevail at any given time or place are unlikely to be connected with each other in any coherent or functional way. There may be instances in which ideological and institutional patterns "fit" together and cumulate into something that looks like an equilibrium (on the notion of "fit" see Skocpol 1992). At other times, however, they will collide and chafe, creating an ungainly configuration of political circumstances that has no clear resolution, presenting actors with contradictory and multidirectional imperatives and opportunities.

These considerations immediately shift attention away from any particular regularity and onto the tension or complementarity among patterns that might more plausibly drive the dynamics of political development. If we picture politics as occurring in multiple concurrent orders, it is in the friction between orders that we may more readily find the seeds of change within the politics of any given moment. Samuel Huntington (1981) identifies just such friction, between political ideals and the performance of political institutions, as the motive force behind American political development; when the gap between ideals and institutions grows large enough, he argues, periods of "creedal passion" occur in which institutional practices are reformed to align more closely with the ideals. Huntington's approach suggests the importance of the lack of fit among multiple ideological and institutional orders as an important motor of political change (although it is unclear what the causal mechanism is). But his view of these orders, particularly of ideas, is a relatively static one, in which a constant set of political ideas-the American Creed-serves as a fixed point to which political institutions and practices are tethered so that, like a pendulum, they return with a certain mechanical regularity and periodicity toward a central location. Political ideas and institutions are not fixed, however. Certain ideological constructions, at the level of Huntington's Creed (or culture, or ideology, or tradition)—the ideals of liberty and equality, for example—have a very long life span and can define enduring boundaries that a nation's politics will rarely, if ever, cross (Greenstone 1993). But ideas at this level do not offer a concrete guide to understanding the more precise pathways a country's political development might take. Many particular programmatic beliefs might be consistent with these broad boundary conditions, and these ideas might change more quickly. Moreover, the interpretation and framing even of deeply rooted ideas might change over time, so that concepts such as "liberty" or "equality" might be invoked to support very different practices in different contexts by people who all the while believe themselves to be upholding a timeless and unchanging political tradition. Similarly, some institutional features of politics are relatively stable over long stretches of time, while others are less fixed and more variable. If we unmoor both sets of factors from overly general assumptions about their fixity and stability, new patterns of order and change may well emerge into view.

As an example of this analytical dilemma, consider pluralism and consensus historiography, which dominated American social science in the aftermath of World War II. This approach, exemplified by such scholars as Louis Hartz (1955), Richard Hofstadter (1948), and David Truman (1971), offered a view of American politics in which ideology, institutions, and behavior were fundamentally aligned with one another. Liberal individualism, skepticism toward the state, the separation of powers, and a commitment to a set of "rules of the game" all went together to create

a unified and ordered whole, in which ideas, institutions, and interests reinforced one another to produce a frictionless politics of incremental adjustment and group accommodation, devoid of intense, polarizing, and destabilizing institutional or ideological confrontations (Bell 1960). But this school of thought lacked the capacity to explain the convulsive changes in American politics in the 1960s, such as the civil rights revolution, which mounted a profound challenge to the pluralist picture of order, consensus, and functionality—the type of untidy change that Truman (1971, xliv, 524) called (with more than a little horror) "the whirlwind." Even writers in this school who recognized the civil rights challenge, such as Gunnar Myrdal (1944), could not conceive of racism and segregation as anything other than mistakes, deviations, somehow external to the American political tradition (Smith 1993, 1997). But an alternative perspective understands the civil rights transformations of the 1950s and 1960s not as alien to the American political tradition but as outgrowths of many of the very ideological and institutional structures that are constitutive of it: an ideology of equal rights; political mobilization and organization; pressure on policymakers through the courts, electoral politics, and other institutional venues, and so forth (Klinkner and Smith 1999; McAdam 1982). In this view, the civil rights revolution arose from a clash among elements of the American political system rather than an unexplainable exogenous shock.

The central hypothesis that emerges from this discussion is that where friction among multiple political orders is more prevalent, the likelihood of significant, extraordinary political change (as opposed to normal variation) will increase. Note that this formulation is not necessarily about friction between ideas and institutions, although it may take this form, but about friction among ordered political patterns however constituted, whether institutional or ideational. Institutions can clash with each other, as can ideas. The essential point is to decompose the notion of a single, encompassing political "order" into its component parts, whatever form they happen to take, to judge the extent to which they overlap or conflict, and, finally, to assess whether the disjunction among them plausibly generates important political change. It is an important advantage of this approach that it can consider both institutions and ideas as building blocks of an explanation for political change, but it need not do so if the important motors of change in a given case fall on one side or other of the ideas-institutions divide.

The challenge of identifying and measuring friction among orders is a serious one. As the pluralism example demonstrates, different analysts can find order and disorder in the same material. Most important to the enterprise is simply the careful historical reconstruction of the relevant elements of the political setting of the moment under consideration—a policy debate, an era in political history, whatever the unit of analysis might be. This is not as biased and ad hoc an approach as it sounds at first blush. First, most episodes of important political change have already been the subject of voluminous historical analysis; even if analysts disagree

about the central causes of change, the key contextual factors and political patterns that are likely to generate friction in the political environment will be well known and this is unlikely to be a source of bias in the analysis (see Lustick 1996). Second, the characteristics of the major sources of political order are also well known, through the extensive literatures on ideas and institutions and their effects that I have already discussed. It is important to note that the approach I outline here is not a substitute for work that theorizes about order or discerns and explains ordered patterns in the political world, whether institutional or ideational. In fact, this synthesis can only build on the advances that have been made in the last generation by both institutional and ideational theorists and depends on the continuation and expansion of these research programs (see Fiorina 1996).

Thus finding the multiple political orders that combine and potentially clash to produce change is no great mystery. In general, there will be a finite number of components that will constitute the field of inquiry, what we might call the dimensions of disorder (or order, as the case might be). These can be described in three clusters, each of which is a familiar presence in political analysis. The first cluster comprises governing institutions, whether the conventional institutions of states (legislatures, executives, courts, bureaucracies), international organizations, or other governance arrangements. The second cluster comprises the organizational environment, such as political parties and party systems, the organization of interests, nongovernmental organizations, and the like. The third cluster comprises the ideological and cultural repertoires that organize and legitimate political discourse.

Each of these sets of factors generates incentives and opportunities and defines repertoires of legitimate moves for political actors. Measuring friction, then, is a matter of deriving, from the historical record, accounts of these incentives, opportunities, and repertoires that arise from multiple sources of political order and impinge simultaneously on the same set of actors. What is important is the "directionality" of these incentives. Where they point mostly or predominantly in one direction, at least for most actors most of the time, the result will likely be political stability. Friction, on the other hand, occurs when they point in substantially different directions, especially where they subject the same sets of actors to conflicting pressures that pose acute dilemmas and make conventional moves untenable. In such circumstances, significant political change is more likely to result.

The structure of the multiple-orders argument draws significantly on parallels with Paul Pierson's (1993, 2000a) work on policy feedback and path dependence. Pierson has called attention to processes by which political decisions made at particular moments can become self-reinforcing, making change difficult and costly even when the policies or institutions become dysfunctional (North 1990). The causal process in Pierson's framework involves the "locking-in" of policies or other political arrangements through processes of learning, the coordination and organization of political

activity, and the adaptation of expectations. Political actors, whose interests and understandings of the political world are increasingly likely to be aligned with these arrangements, act to protect them. This approach, with its emphasis on order and regularity, is thus particularly successful at explaining the status quo bias of many political arrangements, as in Pierson's (1994) own analysis of the surprising resilience of welfare policies in the face of strong political and ideological pressures for retrenchment (Wood 2001).

Although the path-dependence framework is especially well suited to explaining continuity, its focus on the unfolding of political processes over time draws attention to the particular mechanisms by which political processes reinforce themselves and consequently provide an important opening to the study of political change (Pierson 2000b; Thelen 1999; Wood 2001). In particular, its causal approach—its attention to the incentives, opportunities, and repertoires that prevailing structures construct for political actors—provides a useful guide to the causal mechanisms that underlie the multiple-orders approach. The causal sequence, in which actors adapt to existing political arrangements and behave in response to them, is parallel, but with the recognition that at any given moment, politics is situated on multiple "paths," each of which contributes to the array of the choices available to actors. When these paths are consonant with one another, when they point actors in complementary directions, the result may be stability and incrementalism; when they are not, rather than self-reinforcing patterns of "lock-in," the result will more likely be instability and uncertainty among actors about how to formulate and pursue their political aims.

Thus the causal mechanism linking structural friction and political change is the reformulation of the incentives and opportunities for individual political action that friction produces—the discontinuities between the expectations generated by the "orders" considered individually and new opportunities presented by the "system" (conceived as a complex of individual "orders"). When stable patterns of politics clash, purposive political actors will often find themselves at an impasse, unable to proceed according to the "normal" patterns and processes that had hitherto governed their behavior. Political ideas and interests that had formerly prevailed might no longer find outlets in the same institutional settings, or institutions might no longer be able to resolve (or even paper over) clashes of ideas as before. Political actors in such circumstances will often be induced to find new ways to define and advance their aims, whether by finding a new institutional forum that is more receptive to their ideas or by adapting ideas to take advantage of new institutional opportunities. The result of these moves is not that old orders are jettisoned but that elements of them are recombined and reconfigured into a new set of political patterns that is recognizably new and yet retains some continuity with the old ones (much as Tocqueville [1955] described the aftermath of the French Revolution).

One key to this explanatory strategy is the openness and unpredictability of these moments when the

normal order of politics is unsettled rather than change per se. Such friction, it is important to note, need not actually produce substantial change. The Clinton administration's health policy effort of 1993-94, for example, was a moment when a variety of institutional and ideological currents—electoral politics, interest-group configurations, policy legacies, and ideas flowing from the health policy community, among other thingscombined to make the status quo seem untenable and to make dramatic policy innovation seem possible, if not probable (Hacker 1997; Peterson 1998; Skocpol 1996). That Clinton's effort failed does not diminish the importance of understanding politics in terms of overlapping orders; rather, it underscores the importance of identifying such moments of prospective choice and opportunity when new directions seem genuinely available and tracing the choices actors make under these circumstances.

This perspective presents politics as a process that may have stable elements but contains within itself the seeds of change, much like Joseph Schumpeter's (1950, 83) notion of "creative destruction," which he called "the essential fact about capitalism." In this picture, Schumpeter argues, "analysis of what happens in any particular part of [the economy]-say, in an individual concern or industry—may clarify details of mechanism but is inconclusive beyond that." Similarly, the multiple-orders approach suggests that political life thus rarely settles into stable patterns that persist unchanging for long periods; rather, it may be more fruitful to regard politics in terms of systems, as Robert Jervis (1997) argues, in which multiple sets of interconnected relational patterns interact. Analytically, this turn suggests a move toward a more configurative and relational approach to political change, which focuses "less on the causal importance of this or that variable contrasted with others but more on how variables are joined together in specific historical circumstances" (Katznelson 1997, 99).

Much path-breaking work on political change takes something like this approach. In his important account of changing institutional rules in the U.S. Congress, Eric Schickler (2001) develops a model of "disjointed pluralism," in which different interests drive the process of building coalition's for congressional reform at different times, and various reforms adopted to serve different purposes are layered atop one another. "By disjointed," he writes, "I mean that the dynamics of institutional development derive from the *interactions* and tensions among competing coalitions promoting several different interests. These interactions and tensions are played out when members of Congress adopt a single institutional change, and over time as legislative organization develops through the accumulation of innovations, each sought by a different coalition promoting a different interest" (Schickler 2001, 4; original emphasis). The result is a dynamic process of reform and development, in which members of Congress continually find themselves dissatisfied with their institutional setting, but for shifting reasons as both interests and institutions evolve. No reform is ever complete in that it does not sweep away old rules to create a new, self-contained, coherent order, and it is the constant friction among procedural rules, organizational structure, and members' goals that drives the developmental process forward.

Several recent works in the ideational camp also take this approach (although rather less self-consciously). In his account of the transition from Keynesianism to monetarism in Britain, Peter Hall (1993) shows how a process of social learning created friction not just within the Keynesian paradigm that dominated policy but between the shifting ideological milieu and the institutional structure of British economic policymaking. What made the ideological drift from Keynesianism toward monetarism particularly influential in fundamentally remaking policy was not just the ideological triumph of a new paradigm but the difficulties that ideational change posed for institutional actors—the Treasury, the Bank of England, the Cabinet. Similarly, Kathleen McNamara (1998) locates the causes for the success of monetary union in Europe at the intersection of shifting policy ideas and the increasingly brittle structure of international economic institutions. These works show how the disjunction among differently constituted political orders, both ideational and institutional, can drive processes of political development.

# IDEAS AND INSTITUTIONS IN AMERICAN RACE POLICY

As an illustration of how the overlay of ideological and institutional patterns can generate dramatic and unexpected political change, I sketch an example from American political development, the history of race policy in the United States in the 1960s and 1970s. The trajectory of race policy provides ample demonstration of the potential of a multiple-orders approach to explain outcomes that seem to defy analysis in terms of stability and order. In this section, I begin by outlining the puzzle that civil rights policy presents, namely, the surprising emergence of affirmative action. I then sketch the institutional and ideological contexts that seemed to make this development unlikely. Finally, I show how affirmative action arose out of the tension created by this particular configuration of elements by inducing actors to behave in ways that defied the expectations of more linear models of policy development.

The Civil Rights Act of 1964 adopted an explicitly color-blind approach to prohibiting racial discrimination in employment: Title VII of the act outlawed deliberate, individual acts of discrimination such as the refusal to hire or promote individuals because of their race. In doing so, the act appeared explicitly to rule out an alternative, race- and group-conscious approach to recognizing and remedying discrimination in the workplace. It refused to recognize so-called "statistical discrimination" (the inference of discrimination from the mismatch between an employers' proportion of minority employees and the proportion of minorities in the local labor force) and refused to sanction group-based remedies for discrimination, such as targets or quotas for the hiring of minorities. And yet within 10 years of

the act's passage, the United States had adopted just this approach, having developed an extensive set of race-conscious, group-based policies and practices that offer compensatory advantages to members of historically or currently disadvantaged groups—known collectively as affirmative action.

This transition, from a convergence on colorblindness to an embrace of race-conscious remedies for discrimination (ambivalent and controversial, to be sure), poses a sharp challenge for both ideational and institutional explanatory approaches. Color-blindness, as John Skrentny (1996) has pointed out, is part of the taken-for-granted ideological and cultural fabric of American political life: the principle that individuals should be judged and afforded opportunity without reference to their race (or any other irrelevant characteristic). How, then, did American policy effectively turn away from this powerful idea and embrace its opposite, even after major legislation effectively affirmed and institutionalized the notion of color-blindness in national policy (Burstein 1985)? At the same time, the agency created to enforce the Civil Rights Act's vision of color-blind policy—the Equal Employment Opportunity Commission (EEOC)—was given no effective enforcement power and was relegated to a sideline role as conciliator and investigator. It could neither order remedies for discrimination nor file lawsuits. Moreover, the EEOC was embedded in a fragmented and decentralized state that frustrated the aims of civil rights advocates who sought vigorous enforcement. And yet the "weak" American state not only proved surprisingly effective at devising means of enforcing antidiscrimination law, but also managed to challenge the color-blind presumptions of its own law and to forge an extensive network of race-conscious policies and practices that have proven strikingly resilient in the face of political and legal challenges.

Analytically, then, the puzzle is that neither ideas (the apparent triumph of color-blindness in 1964) nor institutions (the apparent weakness of the civil rights enforcement apparatus) predict the emergence of affirmative action in any kind of way that makes sense. Neither approach even comes close; both would lead us to expect anemic enforcement, color-blindness because it rules out collective, compensatory hiring policies and institutional weakness because it leaves the state with little or no coercive power to enforce the law. In statistical parlance, the signs on the parameters are wrong.

Answering this puzzle thus demands a perspective that can account for the development of rather dramatic change out of political elements that seem to point toward stability. The development of civil rights policy was situated in several ideational and institutional orders simultaneously. Ideologically, the debates over civil rights represented the culmination of a long-standing debate in American political and intellectual life between color-blind and race-conscious visions of American society. On one hand, the American liberal tradition demanded color-blindness—the idea that race is irrelevant to citizenship and that the law, the state, and public policy should make no distinctions between persons on account of skin color. The color-blind vision

of civil rights policy invoked the deeply rooted traditions of individual rights and equality before the law (Skrentny 1996, 7). This idea has a long intellectual lineage in civil rights policy, dating at least to 1896, when Justice John Marshall Harlan wrote in his dissent in Plessy v. Ferguson (1896, 559) that "our Constitution is color-blind, and neither knows nor tolerates classes among citizens. In respect of civil rights, all citizens are equal before the law." But Harlan wrote as the lone voice against a decision that, in fact, validated an alternative vision of civil rights policy, an ascriptive tradition of racism that had long challenged liberalism for ascendancy in American politics (Smith 1997). In this view, race was not only a legitimate but an essential political category, and in Plessy's wake racial distinctions could be (and were frequently) invoked to protect white supremacy and state-sponsored segregation.

Not surprisingly, the race-conscious ideological tradition was not popular among civil rights advocates for much of the twentieth century. But in debates over how to prevent racial discrimination in such spheres as education, commerce, and employment, it became increasingly clear that a straightforward color-blind approach would not suffice, because in any context, simply treating race as irrelevant would not outweigh the effects of past discrimination that left many, if not most, African-Americans ill equipped to take advantage of the opportunities that color-blindness might offer. Beginning in the 1940s with the Fair Employment Practices Commission and continuing through the 1950s, civil rights advocates and public officials concerned with racial equality began to debate whether race-conscious means were necessary to achieve manifestly color-blind ends (Burstein 1985; King 1995, 208-9; Kryder 2000, 88-132; Skrentny 1996, 114-17). This dilemma found felicitous expression in the phrase "affirmative action," which was included almost casually in an executive order issued by President John F. Kennedy in March 1961. The phrase was intended not to supplant the order's fundamentally color-blind purpose (to ensure nondiscrimination by federal government contractors) but to supplement it, indicating vaguely that employers ought to take extra steps to ensure that hiring was not biased but not indicating how they were to go about this (Graham 1990, 40-43; Kennedy 1961; Skrentny 1996, 114). Thus the debate surrounding the Civil Rights Act occurred on ideological terrain defined by two competing paradigms, each of which had a deep intellectual legacy as well as institutionally powerful proponents.

These debates took place in several nested institutional settings. They were played out, first, in a Congress still dominated, as it had been for much of the twentieth century, by Southern Democrats, who wielded disproportionate power through a variety of procedural and organizational mechanisms (such as the filibuster in the Senate) and who were by and large committed to protecting their region's autonomy in racial matters (Key 1949). Second, they were shaped by a party system in which race was playing an ever-growing role. In particular, the Democratic party was increasingly divided over civil rights, leaving Republicans in the

pivotal position in the policymaking process (Carmines and Stimson 1989; Katznelson, Geiger, and Kryder 1993). These characteristics of congressional and partisan politics underscored a deep sectional split that had long been a central structural feature of American politics and prevented Congress from passing any civil rights legislation from 1875 until 1957 (Bensel 1984; Key 1949). Third, civil rights policy was made in the context of a chronically weak and fragmented state, in which civil rights authority, such as it was, was already divided among a number of different administrative agencies, most of whom lacked coercive authority. Moreover, the federal civil rights establishment was steeped in the color-blind model of antidiscrimination policy (Skrentny 1996, 34). These institutional factors did not augur well for significant change in civil rights policy; rather, they tended to pull policy toward the status quo or, at least, to foreclose all but incremental moves toward color-blindness.

Two other elements of the institutional context, however, looked more promising. The first was the cyclical pattern of American presidential elections. Both Kennedy and then Lyndon Johnson needed to balance the electoral demands of Southern whites and Northern blacks, each of whom was an essential piece of the Democratic coalition. Consequently, civil rights legislation posed both challenges and opportunities for building a reelection coalition in 1964 (Miroff 1981). Civil rights posed similar challenges and opportunities for Richard Nixon in his own presidential bids, as he sought to pry the South loose from the Democrats' grip while also competing for minority votes (Frymer and Skrentny 1998). For all of these presidents, civil rights offered an opportunity for distinctive and bold action, although one that had to be handled gingerly (Skowronek 1993). The second such factor, and what made civil rights an irresistible political force for these presidents, was the civil rights movement, which embraced race-consciousness in a double sense, both embodying it in its embrace of race as a collective political identity and championing it as a policy paradigm.

The conflict and ambivalence among these contending institutional and ideological forces, particularly between color-blind and race-conscious visions of antidiscrimination policy, were played out first in congressional deliberations over the Civil Rights Act of 1964. Civil rights advocates embraced a policy vision that coupled a race-conscious approach with strong regulatory enforcement by the federal government by creating a new agency with the power to uncover and prohibit broad patterns of discrimination by employers. This approach was opposed not only by Southern Democrats, who were almost-unanimous in their unalterable opposition to any federal action on civil rights, but also by Republicans, who mistrusted the expansion of state power it entailed, and the Kennedy administration, which could ill afford to alienate the South. A somewhat stripped-down bill passed the House in February 1964, only to run into a three-month filibuster in the Senate. The act's final form was the product of a compromise between Senate Republicans and Northern Democrats, with the blessing of the Johnson administration. The compromise, brokered by Senate minority leader Everett Dirksen, resolved both the ideological and the institutional questions that were at the center of the debate. Ideologically, the Dirksen compromise fell squarely in the color-blind camp, defining discrimination as a deliberate individual act and apparently explicitly ruling out collective, race-conscious remedies. Institutionally, the compromise substantially hollowed out the enforcement authority of the new EEOC (Graham 1990).

Although the Civil Rights Act certainly counts as dramatic political change, it was in many ways consonant with much that had come before, both in its embrace of color-blindness and in its withholding of strong coercive enforcement power from the state. Moreover, by establishing an apparently consistent and coherent set of ideological and institutional parameters for civil rights policy, it seemed poised to lock antidiscrimination enforcement into a pattern of weak enforcement. Looking at the situation prospectively from the vantage point of 1964, there are several compelling institutional and ideational reasons to expect this outcome. First was the lack of state power. The EEOC could neither order employers not to discriminate nor sue them. The second was the fragmentation of state power. The EEOC was only one among a veritable alphabet soup of civil rights agencies in the federal government, each with its own turf and resources. It was, like all federal agencies, subject to the oversight of both the president and Congress, which remained subject to the same electoral and partisan forces that had produced the compromise in the first place. A result of ineffectual bureaucratic enforcement subject to contending interests and political interference would not have been at all inconsistent with other regulatory initiatives in this period, as institutional theory has frequently confirmed (Fiorina 1977; Moe 1987, 1989). Finally, the Civil Rights Act institutionalized color-blindness, writing its presumptions quite explicitly into the law. Both the institutional and the ideational settlements of 1964 seemed to create a new status quo, a new equilibrium, that would carry forward, and analytical perspectives that emphasize either institutions or ideas as constraints on political behavior or on ordered patterns in political life would expect this equilibrium to endure. None of these factors points toward the emergence of a strong, race-conscious antidiscrimination enforcement mechanism.

And yet emerge it did. The momentary resolution embodied by the Dirksen compromise generated friction among its ideological and institutional elements that deflected antidiscrimination policy from the path it seemed most likely to take. In particular, the Dirksen compromise produced a critical mismatch between the ideological underpinnings of antidiscrimination policy and the institutional capacity created to enforce it. In general, this friction arose because, despite the compromise, the Civil Rights Act established strong expectations that the federal government would act to combat employment discrimination, expectations that shaped the outlooks and interests of presidents and members of Congress, bureaucrats in the EEOC and elsewhere, and advocates in the civil rights movement,

among others. The model of enforcement implied by the law's color-blind ideological approach was one of retrospective judgment, in which deliberate individual acts of discrimination could be adjudicated and punished after the fact. But—and here is the critical source of friction in the civil rights enforcement regime—the law did not throw the state's institutional weight behind this enforcement model: The EEOC could investigate and conciliate in individual cases; the Justice Department could bring lawsuits, but only in "patternor-practice" cases where it could document systematic, rather than simply individual, discrimination; and, after Johnson's Executive Order 11246 in 1965, the Labor Department could threaten to rescind federal contracts when it could document discrimination (Graham 1990, 180-87; Johnson 1965; Skrentny 1996, 133-34). No arm of the federal government possessed the power to enforce the central employment discrimination aim of the Civil Rights Act. Color-blind antidiscrimination policy, focused on punishing particular individual instances of discrimination by employers, failed to take hold not primarily because of a lack of consensus on color-blindness as a goal but because the institutional setting of civil rights enforcement efforts provided weak support for this model.

More particularly, this mismatch between the ideology embedded in the Civil Rights Act and the institutional capacity that it created affected the incentives and opportunities of political actors in the civil rights field. For presidents, first Johnson and then Richard Nixon, it posed a political dilemma. Vigorous enforcement would please the act's supporters and assuage the still vigorous forces of the civil rights movement but would displease Johnson's fellow Southerners and other skeptics of strong state civil rights authority. On the other hand, a White House task force in June 1964 doubted "that the bill will make for sufficient or sufficiently rapid progress as far as the Negro and a good part of the white community is concerned to placate the forces that have gathered over the past years."6 The Johnson administration responded by temporizing—first by delaying appointing EEOC commissioners, then by only half-heartedly supporting moves in Congress to expand the EEOC's power, and, finally, by developing and then shelving a plan to require minority hiring targets of federal contractors (the "Philadelphia Plan") (Graham 1990, 177–79, 278–97).

Nixon faced a similar dilemma. On one hand, he hoped to pursue a "Southern strategy," winning traditionally Democratic white Southern votes. On the other hand, he had to do something; he could not ignore the prevailing (if precarious) civil rights

consensus in the rest of the country by burying the problems of employment discrimination enforcement (see Skowronek 1993). Although given the party's right turn on civil rights in the early 1960s a Republican administration was perhaps an unlikely champion of strong federal enforcement, Nixon had in fact long worried that the United States's record on race relations weakened its international position in the Cold War (Dudziak 2000). He opposed expanding the EEOC's power and eventually engineered and signed compromise legislation in 1972 that gave it the power to file lawsuits (although not to issue regulatory cease-and-desist orders). Most important, however, Nixon resurrected the Philadelphia Plan, throwing the weight of the executive branch behind race-conscious antidiscrimination policy with the power of coercive sanctions behind it (Skrentny 1996, 137–39, 193–211). This move—a form of affirmative action as we know it today—allowed Nixon to support enforcement efforts in the North while soft-pedaling the issue in the South (where he was simultaneously winning credit with his vigorous opposition to school busing) and to drive a wedge between African-Americans and labor unions, two pillars of the Democratic party's constituency. It thus proved an apt vehicle for Nixon to negotiate his complex partisan, sectional, and electoral situation.

For other actors as well, the ideological-institutional mismatch of the new civil rights regime presented opportunities as well as constraints. The unfortunate executives and bureaucrats of the EEOC found themselves in a nearly impossible position. Expected to enforce the law but left essentially powerless to do so, the EEOC had to find other outlets to fulfill its enforcement mission. These institutional limitations, however, proved a double-edged sword. On one hand, the EEOC's relative weakness and political vulnerability reflected the general limits on administrative power in American government. On the other hand, these very same institutional constraints created a great deal of slack in the commission's political and administrative environment. Limits on its power forced it to seek other means of influence, particularly by collaborating with other institutions, both inside and outside the state. This imperative drove the problem of antidiscrimination enforcement into the same fragmented and decentralized political arena that had produced the EEOC's incapacity in the first place. The struggle for enforcement would be fought out not in terms of administrative power emanating from Washington but in multiple arenas and jurisdictions around the country. In this context, the EEOC sought to play what role and forge what alliances it could as it sought pragmatic rather than ideological or coercive solutions to the problem of fulfilling its mandate in constrained environment (Skrentny 1996, chap. 5).

In moving away from its prescribed institutional role, the EEOC was also led to move away from the color-blind model of antidiscrimination enforcement. Among the EEOC's key partners in this endeavor were African-Americans themselves, especially groups such as the NAACP that were important proponents of race-conscious approaches to civil rights policy, particularly

of affirmative action in the form of the same kind of hiring targets imposed by the Philadelphia Plan. In particular, these groups were equipped to undertake the fight for affirmative action on the local level. Despite the mass national mobilization that characterized the civil rights era, the attempts to bypass the pervasive localism of African-American politics—in the civil rights movement, the War on Poverty, and the courts did not ultimately forge firm political links between African-Americans and the national state. Despite (or perhaps because of) overwhelming electoral support for Democratic candidates, African-Americans found themselves political captives of an increasingly indifferent party at the national level (Frymer 1999). Instead, African-American political organization flourished at the local level in the late 1960s and early 1970s, continuing the traditional pattern of linkages between African-Americans and the state. But whereas these historical patterns of diffusion, decentralization, and local attachment had long been sources of weakness for the political fortunes of African-Americans, in the present context they were, ironically, sources of strength. In particular, federated organizations such as the NAACP and its Legal Defense Fund could collaborate with the EEOC in pursuing race-conscious remedies for employment discrimination in a variety of local-level forums (Greenstone and Peterson 1973; Lieberman 1998; Morone 1990, chap. 6; Skocpol, Ganz, and Munson 2000).

The principal institutional arenas for these activities were collective bargaining between union locals and employers and lawsuits in the federal courts; both of these arenas allowed the EEOC to get around its lack of coercive authority. In particular, the EEOC's relationship with the federal courts (especially after the 1972 amendments) proved empowering, because it gave the commission access to a politically and organizationally independent means of deciding discrimination cases and enforcing remedies. It was by these alternative routes that the EEOC became a key player in subverting the very color-blind model of race policy that it had been created to enforce. It held hearings to publicize egregious cases of discrimination, pressuring employers to change their personnel practices. It participated with the NAACP and other civil rights organizations in precedent-setting antidiscrimination actions in labor negotiations and the federal courts that shaped antidiscrimination practices in a wide swath of American industry. The EEOC, for example, played a central role in Griggs v. Duke Power Company (1971), the case in which the Supreme Court ruled that employers could not use even ostensibly race-neutral tests or other occupational qualifications that tend disproportionately to bar minority applicants, unless the employer could show that they were a bona fide qualification for the job in question (Graham 1990, 383-90; Stein 1998). Like the presidential initiatives designed to cut through the ideological and institutional confusion engendered by the Civil Rights Act, these moves contributed to the unraveling of the color-blind consensus and the consolidation of a race-conscious policy approach backed powerfully by the state by the early 1970s, an outcome that had seemed most improbable only a decade earlier.

#### CONCLUSIONS

This history suggests that the answer to the problem of understanding puzzling change in American race policy lies at the intersection of ideas and institutions and in the tension between ideological traditions and institutional capacities. In the case of American race policy, the Civil Rights Act seemed to embody a particular ideological approach to racial inequality, but the institutional incentives and opportunities in which key actors were embedded allowed them to mount a challenge to this approach even while claiming to maintain it (and possibly even believing they were doing so). In fact, had the EEOC been given greater coercive powers at the outset to enforce the color-blind vision of antidiscrimination law, it is likely that the impulse for affirmative action would have been weaker, because the EEOC would have turned its attention to an apparently more fruitful set of tasks.

More generally, this analysis suggests that public policies are most fruitfully understood as the results of political conflicts in which particular elements of national cultural and ideological repertoires are mobilized and enacted into policy. These political struggles take place within historical and institutional contexts that define the allocation and exercise of political power and so shape policymaking, especially by constraining political behavior through the operation of rules, norms, and organizational settings (Thelen and Steinmo 1992). At the same time, institutions also create strategic opportunities for purposive political actors to further their interests, and they shape political opportunities for the mobilization of social interests (Tarrow 1994). Similarly, political ideas and cultural traditions institutionalized, taken-for-granted understandings of political and social arrangements—also constrain and enable policymaking, both by limiting the range of policies that are considered rational and by giving policymakers a repertoire of legitimating tactics for their favored policies (Campbell 1998; Dobbin 1994; Hall and Taylor 1996; Powell and DiMaggio 1991).

National political structures thus shape policy outcomes not simply by organizing power but also by acting as gatekeepers for political ideas and cultural dispositions. Policymaking in democratic government is not simply a process of optimizing the choice of policy instruments to solve readily identifiable social problems (Kingdon 1984; Lindblom 1959; Stone 1997). Rather, it entails the formation of coalitions among actors who represent both interests vying for power and diverse policy ideas. Because this coalition-building process combines what Hugh Heclo (1974, 305-6) has called "powering" and "puzzling"—clashes of both power and culture among social interests—the results it produces are not necessarily coherent and orderly but rather tend to build on prior policies without clearing away or dismantling them. The very process of policymaking can perpetuate the system of clashing

ideological and institutional orders and thus push forward the dynamic processes of political change.

The civil rights story underscores the fundamental point—that neither ideas nor institutions can rightly claim priority in an account that purports to explain significant political change (or even to describe it in a richly complex enough way to make a convincing, theoretically grounded explanation possible). What has changed, after all, in the civil rights story is not simply the values of a group of right-hand-side independent variables—public opinion about segregation, say, or the strength of the civil rights movement, or the level of interracial economic competition—resulting in a predictable change (within standard tolerances) of the left-hand-side dependent variable—antidiscrimination policy.

Rather, what has changed is the very relationships among factors that and the processes by which a set of underlying conditions generates outcomes. The evolution of race-conscious affirmative action out of the color-blind premises of the Civil Rights Act resulted not simply from the marginal adjustment of a set of independent variables producing linear policy effects, but from an entirely new configuration of mostly familiar elements—the same elements, in fact, that helped to shape the Civil Rights Act itself: ambivalence and contention over color-blindness and race-consciousness as ideological models for race policy, and fragmented and decentralized political institutions. Neither ideas nor institutions alone are sufficient to explain the trajectory of American race policy in the 1960s and 1970s. But the configuration of these two elements together enabled pragmatic but principled politicians, bureaucrats, lawyers, civil rights leaders, union leaders, corporate executives, and others to grope toward a set of practices that amounted to a fundamental transformation in race policy in a decade or so, one that embraced race-conscious employment practices and strong state action and one that deeply penetrated the state and civil society (Dobbin and Sutton 1998; Farhang 2001; Graham 1990; Skrentny 1996; Stein 1998).

So when *does* an idea's time come? The answer lies in the match between idea and moment. An idea's time arrives not simply because the idea is compelling on its own terms, but because opportune political circumstances favor it. At those moments when a political idea finds persuasive expression among actors whose institutional position gives them both the motive and the opportunity to translate it into policy—then, and only then, can we say that an idea has found a time.

This is not a story of variables but of configuration, not of ordered patterns of ideas or institutions in equilibrium, but of disjunction, friction, and overlap among ideational and institutional elements, none of which is sufficient but each of which is necessary for a more comprehensive explanation of an important episode of political change. It suggests the potential power, even the necessity, of an approach that considers both institutions and ideas as integral to political explanation and it underscores the importance of understanding the ways in which they interact to produce outcomes that, from either partial perspective, seem unpredictable. Above all, it shows off the advantages of an approach that relaxes considerably the traditional social-scientific emphasis on order and embraces what Lionel Trilling (1950, 10), perhaps one of the more unexpected prophets of American social science but a shrewd commentator on the American liberal tradition, called "variousness, possibility, complexity, and difficulty."

### **Conceptualizing Culture: Possibilities for Political Science**

LISA WEDEEN University of Chicago

This essay makes a case for an anthropological conceptualization of culture as "semiotic practices" and demonstrates how it adds value to political analyses. "Semiotic practices" refers to the processes of meaning-making in which agents' practices (e.g., their work habits, self-policing strategies, and leisure patterns) interact with their language and other symbolic systems. This version of culture can be employed on two levels. First, it refers to what symbols do—how symbols are inscribed in practices that operate to produce observable political effects. Second, "culture" is an abstract theoretical category, a lens that focuses on meaning, rather than on, say, prices or votes. By thinking of meaning construction in terms that emphasize intelligibility, as opposed to deep-seated psychological orientations, a practice-oriented approach avoids unacknowledged ambiguities that have bedeviled scholarly thinking and generated incommensurable understandings of what culture is. Through a brief exploration of two concerns central to political science—compliance and ethnic identity-formation—this paper ends by showing how culture as semiotic practices can be applied as a causal variable.

n epistemologies ranging from literary studies to rational choice theory, issues broadly construed as "cultural" have been animating academic debates, encouraging interdisciplinary exchanges, and inspiring battles over the methods, evidence, and goals of scholarly research. In this essay, I offer a critical analysis of the problems involved in current usages of the term in political science, make the case for a conceptualization of culture as semiotic practices, and show why it has value for, and how it might be employed by, political scientists.

In political science, the concept of culture used to be associated primarily with the literature on political culture that emerged in the context of postwar political sociology, with its interest in policy initiatives intended to reproduce the conditions of Western democratization abroad (Somers 1995, 114). Derived from Max Weber's ([1905] 1958) classic analysis of the "elective affinity" between the Protestant ethic and the rise of capitalism

<sup>1</sup> Kroeber and Kluckhohn's (1952) historical overview of the changing meanings of the word "culture" in German, French, and English estimated that there were over 160 definitions in use in the 1950s (Brownstein 1995, 313; Steinmetz 1999, 5). Raymond Williams (1983, 90) limited his analysis to four main ordinary and academic uses, but he also observed that culture was "one of the two or three most complicated words in the English language" (Sewell 1999, 39; Steinmetz 1999, 5).

in the West, these studies attempted to show how cultural attitudes and beliefs either hindered or enabled "progress" (Banfield 1958; McClelland 1961, 1963; Pve 1965). Conceived in terms of an alleged set of residual values and norms—what Sherry Ortner (1997, 8-9) has aptly characterized as "a deeply sedimented essence attaching to, or inhering in particular groups"—this notion of culture was prominent in the sociology of Talcott Parsons (1949, 1951, 1965) in modernization theory, and in the American cultural anthropology of Franz Boas (1986, 1911), Margaret Mead, and Ruth Benedict ([1934] 1989), as well as in the behaviorist revolution of the 1950s and 1960s. In political science, it was Gabriel Almond's (1956) seminal essay, along with his subsequent collaboration with Sidney Verba (1963), that produced one of the most influential understandings of political culture in terms of "orientations toward the political system," whereby some populations had civic "cultures" and others did not.2 Samuel Huntington's 1993 article in Foreign Affairs, "The Clash of Civilizations?" and his subsequent book The Clash of Civilizations and the Remaking of World Order (1996) mark perhaps the most prominent and polemical recent example of this kind of political culturalism in political science.

Political culture accounts, with their tendencies toward cultural essentialism, have rightly come in for criticism by many political scientists. Rejecting such views as either fundamentally tautological or empirically invalid, some critics have opted for one or another strictly "materialist" approach, objecting to the consideration of cultural variables in any form (see, e.g., Hirschman 1984, Jackman and Miller 1996, and Tilly, 1975, 603–21). The ascendance of methodological individualism

Middle East studies is one field in which the concept has been especially charged. I have in mind scholars such as Lisa Anderson, Kiren Aziz Chaudhry, and Michael Hudson, all of whom use "culture" to

<sup>&</sup>lt;sup>2</sup> This summary of the political culture school admittedly simplifies a complex group of approaches. In political science, the "classic" study was Gabriel A. Almond and Sidney Verba's (1963) *The Civic Culture: Political Attitudes and Democracy in Five Nations.* See also Pye 1965, 512–60. For one of the most recent influential books in this genre, see Putnam, Leonard, and Nanetti 1993. and rational choice theory in the mid-1980s also led practitioners to argue that the analysis of group values or customs such as those associated with the term culture was irrelevant to political inquiry (Przeworski 1985). Politics concerned material interests and the relative success or failure of the individuals articulating them. Symbolic displays and rhetorical practices were epiphenomenal.

Although individual rational choice theorists have often been at pains to reject culturalist arguments as tautological, untestable, or beside the point, faced with explaining postcommunist upheavals, ethnic violence, "identity" politics, religious "fundamentalism," and the ongoing problems of democratic transitions, others have resorted to culture as a "fallback" position, a way of accounting for divergent and often disappointing political outcomes (Kuper 1999, 10). By claiming that "cultures" have "peculiarities" that explain the failure of those nation-states to democratize, or by asserting that political conflict is the outcome of "irreducible cultural differences" (Bates et al. 1998; Greif 1994, 912-50; Rogowski 1997, 14), these theorists have responded to genuine explanatory needs by reviving an outmoded and unhelpful understanding of the concept. A concept of culture defined from the perspective of political science, but informed by the debates in critical anthropology, would require changes in the ways the term is applied and in how political phenomena are analyzed and explained.4

The purpose of this essay is to show how a critical understanding of culture as practices of meaning-making facilitates insights about politics, enabling political scientists to produce sophisticated causal arguments and to treat forms of evidence that, while manifestly political, most political science approaches tend to overlook. Studying meaning-production entails analyzing the relations between agents' practices (e.g., their work habits, gendered norms, self-policing strategies, and leisure patterns) and systems of signification (language and other symbolic systems) (Sewell 1999; see also Ortner 1997). The words "semiotic practices" are shorthand for this approach. This conceptualization operates on two levels. First, culture as semiotic practices

mean identifiable essences or sedimented values inhering in particular groups. Chaudhry (1994), in particular, tends to confuse Samuel Huntington's invocations of the term with any interest in "culture" or cultural studies. See also Anderson 1995, 77–92, and Hudson 1995, 61–76

refers to what language and symbols do-how they are inscribed in concrete actions and how they operate to produce observable political effects. In this sense, culture can be used as a causal or explanatory variable. At the same time, insofar as semiotic practices are also the effects of institutional arrangements, of structures of domination, and of strategic interests, activities of meaning-making can also be studied as effects or dependent variables. Second, culture as semiotic practices is also a lens. It offers a view of political phenomena by focusing attention on how and why actors invest them with meaning. While every activity has a semiotic component, the point here is not to assert that politics must be examined from a semiotic-practical point of view. Whether one does or does not explore processes of meaning-making will be determined by the particular research problem one confronts. At issue are approaches to political phenomena that do seek to encompass cultural considerations. Unlike current invocations of culture in political science, in an empirically grounded, practice-oriented approach to culture, meanings are understood to exist inside historical processes, which themselves are always enmeshed in changing relations of power (Asad 1993, 43).

A practice-oriented cultural approach can help us explain how political identifications are established; how rhetoric and symbols not only exemplify but also can produce political compliance; why some political ideologies, policies, and self-policing strategies work better than others; what terms such as "democracy" (Schaffer, 1998) and "religion" mean to political actors who invoke or consume them and how these perceptions might affect political outcomes; and why particular material and status interests are taken for granted, are viewed as valuable, or become available idioms for dissemination and collective action. By paying attention to the ways in which certain meanings become authoritative while others do not, political scientists can use this practice-oriented concept of culture to help explain why recognizable events or empirical regularities occur. At a minimum, studying culture by identifying relevant semiotic practices has added value to the extent that it allows for nuanced, valid understandings of politics that are capable of undermining previous beliefs and affecting our prior assumptions about the world.<sup>5</sup>

This article is divided into two parts. In Part One, I examine the shared problems and epistemological disagreements that have hobbled debates about culture among political scientists of various orientations. Without overlooking what may be irreconcilable differences, I suggest possibilities for fruitful collaboration. In Part Two, I begin by discussing what practices

<sup>61-76.

&</sup>lt;sup>4</sup> Two political scientists who do follow debates in critical anthropology and consider everyday practices and systems of signification in their work are James C. Scott (1985, 1990) and Timothy Mitchell (1988). To my knowledge, neither has theorized culture explicitly, however, nor have they focused on the conceptual conundrums posed by the term. A recent book attempting to bring anthropologists working on the "culturally specific" into conversation with rational choice theorists in political science was designed to debate the nature and importance of comparison. Although the encounter may have enabled participants to share "a sense that the world's complexity demands some respect," the engagement did not (nor was it intended to) produce clear understandings of what "culture" means (Bowen and Petersen 1999, 2). Indeed anthropologists associated with the project unwittingly reproduced some of the confusions I identify in Part One. For debates about the culture concept in anthropology and elsewhere, see Bonnell and Hunt 1999, Clifford 1988, Clifford and Marcus 1986, Fabian 1983, Gupta and Ferguson 1997.

<sup>&</sup>lt;sup>5</sup> By "valid" I mean—as Bowen and Petersen (1999, 12) write— "the degree to which the account of something picks up processes, ideas, or relationships that are indeed there in the world. Insisting on 'validity' does not imply a correspondence theory of truth (that a true description maps one-to-one onto the world), but only that some descriptions are better than others, and that the kinds of things anthropologists do when in the field—checking with many people, listening in on discussions, and living through events—are particularly good ways to arrive at a good description." I would argue that good descriptions help to ensure accurate explanations of political life.

of meaning-making are and how we should go about studying them. I propose an account of meaning based on intelligibility and then examine concrete methodological strategies for how a version of culture as semiotic practices might be applied as an explanatory or independent variable in political analyses. Through a brief exploration of two concerns central to current research about politics—compliance and ethnic identity-formation—I show how culture can operate as a causal variable, as well as a corrective to prevailing assumptions about political life.

# PART ONE: "CULTURE" IN POLITICAL SCIENCE

#### **Culture Concepts**

Declaring the onset of "a new phase in global history," Samuel Huntington defines "the fundamental sources of conflict" in the current world, not as economic or ideological in nature, but as "cultural." For Huntington, each civilization has a primordial cultural identity, so that the "major differences in political and economic development among civilizations are clearly rooted in their different cultures." He warns, "Culture and cultural identities... are shaping the patterns of cohesion, disintegration, and conflict in the post-Cold War world.... The rivalry of the superpowers is replaced by the clash of civilizations" (Huntington 1993. 22; 1996, 20, 28, 29). For Huntington, "culture" refers to the purported enduring values harbored by "highly integrated civilizations"—also sometimes confusingly termed "cultures."

This understanding of culture as a specific group's primordial values or traits is untenable empirically. It ignores the historical conditions and relevant power relationships that give rise to political phenomena such as "democratization," ethnic conflicts, and contemporary radical Islamicist movements. The group traits version of culture, moreover, rides roughshod over the diversity of views and the experiences of contention within the group or groups under study. In the case of Huntington's depiction of the Middle East, for example, such claims of sedimented essences have led scholars of culture to pass over such now obviously urgent matters as the contemporary nature of Islamicist movements, the causes of their recent emergence, and the ways in which communities of argument exist over what makes a Muslim a Muslim, what Islam means, and what, if any, its political role should be. Treating culture as a set of traits that purportedly distinguish one group from another also neglects the terrains of solidarity and fluidity that exist among groups, the ways in which political communities of various sorts have depended on the cross-fertilization of ideas and practices. In short, by ignoring historical processes and specific relations of political power, the treatment of culture in political science has downplayed the heterogeneous ways in which people experience the social order within and among groups, while exaggerating the commonality, constancy, and permanence of intragroup beliefs and

values. As a result, cultural essentialist explanations of political outcomes such as ethnic or religious violence tend to naturalize categories of groupness, rather than exploring the conditions under which such experiences of groupness come to seem natural when they do.

Some practitioners of rational choice theory use culture similarly to refer to an already-given community that can be studied by listing its fixed shared beliefs or values. The APSA-Comparative Politics Newsletter of summer 1997 (see "Notes from the Annual Meetings: Culture and Rational Choice." 1997), which features summaries from a roundtable debate entitled "Can the Rational Choice Framework Cope with Culture?" as well as solicited contributions, provides a case in point. exemplifying the conceptual confusions and empirical problems in current formulations of culture. On the one hand, scholars contributing to the Newsletter and those invoked within its pages have various understandings of culture and how it works—as common knowledge (Chwe 2001), as symbolic action (Johnson 1997), as "beliefs off the equilibrium path behavior" (Greif 1994), as pertaining "directly to the production of preference orderings" (Lustick 1997), and as "a socially shared and logically interrelated set of symbols, codes, and norms" (Rogowski 1997 and Lustick 1997). "Culture" is used in these examples as an analytic concept, which, as William H. Sewell, Jr. (1999, 39), points out, is usually "contrasted to some other equally abstract aspect or category of social life that is not culture, such as economy, politics or biology." On the other hand, these same scholars invoke "culture," as Huntington would, to denote the beliefs, values, and customs of a specified group. Despite Rogowski's dismissal of the tautological arguments of "political culture" theorists, for example, he nonetheless takes for granted the existence of "respective cultures" with possible "cultural peculiarities" and "irreducible differences," so that "culture" refers both to a "socially shared and logically interrelated set of symbols, codes, and norms" and to a particular community, such as "Catholic culture" (Rogowski 1997, 14). Similarly, James Johnson's (1997, 9) knowledgeable account of "culture" as a symbolic system or as symbolic action is sometimes confused with "cultures"—the plural, concrete, highly integrated worlds within which symbolic systems (cultures) operate.

Despite the multiple understandings of the culture concept, all of these formulations share problems that can be traced at least in part, to political scientists' heavy reliance on Clifford Geertz (whose own understandings of the term were influenced by his teacher, Talcott Parsons, and by Max Weber). 6 Geertz's

<sup>&</sup>lt;sup>6</sup> I have in mind Geertz's Interpretation of Cultures: Selected Essays (1973); Local Knowledge: Further Essays in Interpretive Anthropology; and his important case study, Negara: the Theater State (1980). In Gary King, Robert O. Keohane, and Sidney Verba's (1994) influential political science handbook Designing Social Inquiry, the authors rely on one essay by Geertz, "Thick Description," to discuss culture (pp. 37, 38-40). Abner Cohen's (1974) Two-Dimensional Man: An Essay on the Anthropology of Power and Symbolism in a Complex Society—a rational choice analysis of the strategic manipulation of symbols—was also important to rational choice students of culture (Johnson 1997; Laitin 1986, 1998, 1999).

definition of a "system of symbols" was one that insisted upon coherence—on a reified, frozen system of meaning, rather than on what symbols do. When he studied Bali, for example, he looked for a closed and already configured set of meanings and, thus, was blind to the processes by which ongoing practices and systems of meaning change, are sites of political struggle, and generate multiple significations within social groups. Thus Geertz could invoke the same word "culture" to connote both a fixed, synchronic entity, such as Balinese "culture," and the performances through which the researcher interprets meanings, such as cockfights, teeth filing rituals, state pageants, and funeral rites. The dual connotations of culture as an already given community and as a symbolic system were often made analytically compatible in Geertz's work by the suggestion that the tight integration of a particular, bounded culture was determined by its semiotic coherence as a system of meanings. The insistence on semiotic coherence led Geertz to ignore possible discrepancies between the representation of events, conditions, and people and the ways in which such representations were received, negotiated, and subjected to risks by those who produced and consumed them (Wedeen 1999). People's own divergent interpretations of what a particular ritual or practice meant were of little significance. Analyses of meaning-making focused on an already given, consensually understood "cultural schema" continually performed by actors of particular "cultures" who were seemingly unaffected by historical changes. For Geertz, power and processes of meaning-making became purely symbolic, as did culture and analyses of it. In his "significative system" there is no agency, only an intelligible, seamlessly coherent script or master narrative that actors follow in particular "cultures." Such theorizations of culture also led Geertz to sample on the dependent variable, selecting symbols and meanings that were particularly prone to coherence or systematicity (Sewell 1999: 47).

Despite these problems, Geertz's (1973) enormously influential book, *The Interpretation of Cultures*, gave some political scientists a compelling reason to take symbols seriously. As David Laitin (1986, 12) argued, "Symbols are important because they provide to individuals a sense of meaning. For Geertz, these symbols or, better, the various systems of symbols constitute 'culture." Geertz's refusal to produce falsifiable arguments was at odds with the positivist project of rational choice theory, but his attention to meaning allowed political scientists such as Laitin to discover "the nature of group values" (Laitin 1986, 16). According to Laitin

(1986, 16) Geertz's "thick descriptions" of systems of signification were "methodologically useful" because they registered "the deeply held values of a cultural group." For Laitin (1986, 16),

The database consists in symbolic structures. Only with a keen understanding of the meanings embedded in shared symbols...can one adduce cultural preferences without tautologically claiming that preferences can be derived from the behavior of actors who are assumed to be rational.

Geertz invited political scientists such as Laitin to pay attention to culture as a system of symbols from which researchers could read meaning, but political scientists thereby adopted many of the problems of the Geertzian concept of culture: that the system was reified and fixed, that it was identifiable as bounded, and that meanings were always already set in a given "text." Thus in Laitin's reading of Geertz, culture refers both to "systems of symbols" and to the "deeply held values of a cultural group" (emphasis mine). This slippage could remain unacknowledged because, for Laitin, as for Geertz, to refer to culture as a system of symbols was to claim that culture was a contained system of "deeply held" values and beliefs. Of course Laitin's insistence that "thick descriptions" could be treated as a "database" may seem odd, given Geertz's philosophical insistence on ethnography as an enterprise mediated through the anthropologist's creative interpretation. Geertz's own penchant for treating a particular practice, such as the Balinese cockfight, as synecdochic for Balinese culture made him a particularly blatant and, in many ways, self-professed mediator. In short, political scientists beholden to Geertz improved over the political culture literatures of old by producing theoretically motivated work that emphasized the importance of symbols and took ethnographic evidence seriously. However, Geertzians of various stripes unwittingly conflated various uses of culture in their analyses, thereby perpetuating confusions and compromising the term's explanatory purchase by insisting on the semiotic coherence of a particular community, system of symbols, or "culture." Culture became not only what a group has-beliefs, values, or a symbolic system—but what a group is (a Balinese culture). More importantly, theories of culture tended to render historicized analyses of practice and process impossible or irrelevant, explaining political outcomes as the result of empirically untenable, untestable assertions of uniformity and fixity. Most political scientists continue to think of culture as connoting fixed group traits.

# Real Differences: The Individualist Orientation as an Example

Despite shared problems in formulations of the concept, divergent political, methodological, and epistemological commitments also divide political scientists and are responsible for treatments of culture being less robust than they otherwise might be. One commonly

<sup>&</sup>lt;sup>7</sup> Some critics of Geertz charge that he has no understanding of, or interest in, power relations, but this seems unfair. As Geertz (1980, 120) suggests in his study of political spectacles in nineteenth century Bali, "The pageants were not mere aesthetic embellishments, celebrations of a domination independently existing: they were the thing itself." Moreover, in his famous essay "Thick Description," Geertz claims (1983) that his "interpretive approach," unlike the structuralism he opposes, is going to take into account considerations of power and history. His ethnographic work, however, does not execute this intention.

cited rift is between rational choice theorists and interpretive social scientists (on interpretive social science, see Rabinow and Sullivan 1987). Although I do not intend to reify this distinction, different assumptions, vocabularies, sources of information, and standards of evidence have produced recognizable communities of argument. Unequal access to institutional power and to material resources has also created experiences of groupness that hinder scholarly discussion. For my purposes here, one key difference is the importance the individual plays in analyses of political life.

In rational choice theory—as in the behaviorist political culture literature—the individual is the privileged unit of analysis, even if individual responses are subsequently aggregated for statistical purposes. As George Steinmetz (1999, 19) argues, "This individualistic bias [is] at odds with the point made even by Parsons that culture is not (or not primarily) a property of individuals." This bias tends to produce arguments in which ideas, beliefs, or values, such as "national pride," are often "misleadingly wrenched" from "the social conditions in which they [are] embedded and within which they receive [...] their specific meaning." Similarly, "individualism," as Alexander Wendt (1999, 166, 169) points out, implies that persons are "independently existing" rather than constituted through their linguistic, institutional, and practical relations with others.

Interpretivist approaches, among which can be counted the important innovation of practice anthropology in the 1980s, frequently invoke an agentive individual, but they do not assume a maximizing, costbenefit calculator who is unproblematically divorced from actual historical processes (e.g., Bourdieu 1978). The rational choice formulation of the decontextualized, universalizable individual, whose ideas, beliefs, and values can be extracted from the social and political conditions under which they were generated, produces objects of inquiry that are incommensurable with interpretivist social science. Of course many rational choice theorists do analyze the conditions under which individuals make choices. The individualist bias, however, tends to require that culture be conceptualized as a "constraint" on individual's strategic actions, or "as information for equilibrium selection," or, in the plural, as "manifold equilibria" (Tsebelis 1997). An approach to culture as processes of meaning-construction, in contrast, assumes that actors understand themselves as individuals and as strategic, and as group members and nonstrategic, and that such self-understandings are always mutually constituted and affirmed by others. Meaning-making, in short, implies a social process through which people reproduce together the conditions of intelligibility that enable them to make sense of their worlds—a point to which I return in Part Two. Such a view of culture restores a manifestly collective aspect to political analyses that many individualist accounts lack, without requiring the shared coherence that many culturalist accounts exaggerate.

With innovations in game theory and computational modeling, scholars have begun to introduce learning, information updating, and adaptation into ratio-

nal choice and agent-based analyses.<sup>8</sup> Dissatisfaction with the externalization of preferences in neoclassical economics has encouraged a focus in political science on preference formation, including attempts to make preferences "endogenous" to the models. This concern has led some rational choice theorists to examine how political identities and preferences are formed (Gerber and Jackson 1993; Hardin 1995; Laitin 1998). Yet even in as impressive a study as Laitin's (1998) Identity in Formation: The Russian-Speaking Populations in the Near Abroad, the phenomenon of identity is ultimately reduced to a strategic choice in which individual actors calculate whether to switch from Russian to the titular language on the basis of what they think others will do. These works assume without question that individuals can be adequately conceived for purposes of political science as goal-oriented beings attempting to maximize their interests, given existing constraints (Tsebelis 1997, 16). Indeed, a "constructed" identity, for Laitin (1998, 3-35), is synonymous with a strategically chosen one. Laitin's ethnographic sections are thus devoted to sorting out what his informants were strategic about, rather than analyzing "identity in formation"—how selves are constituted or how language might actually operate, or not, to generate felt identifications.

Rational choice theorists in political science may, of course, differ in the degree of rationality they accord to agents or disagree about how to understand equilibrium, but they are likely to share the common belief among economists that "institutions and patterns of behavior can be explained as the product or outcome of many individual decisions" (Young 1998, 4). Interpretivists might question not only the view of individuals such studies put forth, but also the degree of power or efficacy that individuals have within institutions. The main point to be registered here is simply that insofar as individualism presupposes agents who are forwardlooking strategists forever calculating costs and benefits, there will be a serious ontological and epistemological divide between most rational choice and interpretivist theorists.<sup>9</sup> Interpretivists can rightly claim. in my view, that individualist assumptions prevent rational choice scholars from posing questions that are of manifest importance to politics, not the least of which is how interests are collectively generated and defined, or how we come to know that people maximize their interests, if they do. These disagreements are important ones. It remains to be seen whether further substantive discussion will be worthwhile, but there is no need for such disagreements to foreclose possibilities of cooperation. Nor is there any theoretical warrant, from either side of the epistemological divide, for resisting the

introduction into political science of a post-Geertzian anthropological conceptualization of culture.

#### Fruitful Collaboration

The fact that rational choice theory has engaged with studies of culture invites conversation, and possibly productive argument, between methodological individualists and interpretivists. Game theorists, in particular, have begun to use culture to connote "common knowledge" in their analyses. "Common knowledge" helps to solve games in which preferences and capabilities generate "multiple equilibria"—stable outcomes from which a rational actor has no incentive to deviate. The idea of common knowledge enables rational choice theorists to solve these games by identifying "focal points around which actors' expectations can converge, thereby limiting transaction costs and enhancing the possibilities for coordination under conditions of complexity and uncertainty" (Schelling 1960, 55-56; Chwe 2001, Goldstein and Keohane 1993, Weingast 1995, and Wendt 1999).<sup>10</sup> An oft-repeated example is Schelling's "tacit coordination (common interests)" problem: "You are to meet somebody in New York City. You have not been instructed where to meet; you have no prior understanding with the person on where to meet; and you cannot communicate with each other. You are simply told that you will have to guess where to meet and that he is being told the same thing and that you will just have to try to make your guesses coincide" (Schelling 1960, 55–56). Schelling (1960, 55) tried this problem on an unscientific sample of respondents from New Haven, Connecticut, and found that an "absolute majority" managed to meet at Grand Central Station's information booth, and virtually all persons succeeded in meeting at 12 noon.

Some of the problems with culture as common knowledge are indicated by the example. The concept tends to assume the shared quality or commonness of knowledge rather than to question how—or the extent to which—such understandings are, in fact, tacitly understood or consensually shared. In other words, "common knowledge" derives from a consideration of knowledge that can reasonably be considered common, rather than from a consideration of culture as a manifold outcome of human activity. How do we know whether the outcome in Schelling's Grand Central station example demonstrates common knowledge, or, say, the practicalities of train schedules, or some combination of the two? Are those who do not have this common knowledge outside culture? In those who use Schelling's account, "common knowledge" seems analogous to nature, a background condition—always already there. By naturalizing the concept of culture in this way, rational choice theorists forgo the ability to know whether common knowledge actually exists in any particular instance or whether another, unspecified, variable is doing the work of coordinating action. By tracking how common knowledge gets produced, To be fair, nothing inherent in the idea of common knowledge interferes with asking how that knowledge is acquired or changed, although little practical work has been done on such matters thus far. To put my criticisms in the language of rational choice theory: (a) Common knowledge is one of the descriptors of an equilibrium state; (b) "given that the coordination dynamics on which common knowledge models operate have multiple equilibria, change to different equilibria is theoretically possible; (c) the problem is that noncooperative game theory hasn't seriously modeled the move from one coordination equilibrium to another. Noncooperative coordination games with multiple equilibria are potentially dynamic," but so far have been clunky and static.<sup>11</sup>

Other problems with current uses of common knowledge make it less helpful than it otherwise might be. In a typical example—Michael Suk-Young Chwe's (2001, 7) ambitiously eclectic book, Rational Ritual: Culture, Coordination, and Common Knowledgecommon knowledge means "knowledge of others' knowledge of others' knowledge, and so on." But the examples of common knowledge Chwe provides muddy his analysis and multiply the meanings of the term. Sometimes "common knowledge" means the condition of having the awareness that other people know what you know, and sometimes it seems to indicate the process of coming to know that others know. The "publicity" of public ceremonies sometimes generates common knowledge; at other times publicity refers to "common knowledge generation" (compare pp. 8 and 18). Most importantly, "common knowledge" slips from referring to the knowledge that other people are seeing the same commercial, ritual, or television program to referring to the knowledge that others understand what they see in the same way. And Chwe seems to imply that "common knowledge" is the knowledge that others know that they are interpreting what they see in the same way that each individual viewer does. How do we researchers know (without ethnographic or survey work) that "everyone knows that everyone knows it" or that "knowing it" means the same thing to everyone in question? Perhaps Chwe's assumptions about coordination and conformity have to do with the primary areas with which he was concerned: advertising and rituals. But the latter are often less about generating actual coherence than about representing it publicly. The "common knowledge" that the regime can orchestrate the ritual is not matched by the "common knowledge" of what that ability means: Does it prove societal coherence or demonstrate state power or both, for example? Furthermore, Chwe's operating assumption is that people will want to conform. What about instances of resistance and transgression? What

is subject to change, or is implicated in political relationships of leverage and domination, we can produce robust explanations of why people coordinate their actions when they do, while avoiding erroneous causal inferences.

<sup>&</sup>lt;sup>10</sup> Game theory's adoption of culture as "common knowledge" is discussed in Wendt 1999, chap. 4).

<sup>&</sup>lt;sup>11</sup> This is David Laitin's formulation in a personal communication with the author.

of critiques of prevailing normative orders? What of desires to be different, to be unusual, or to stand out? What of ambivalence? I can imagine conditions under which people conform, basing their actions, as Chwe and others assume, on what they think others are going to do, but I cannot imagine that such pressures are always operative, let alone decisive. Certainly, they are not exhaustively descriptive of politics.

In short, the concept of common knowledge assumes a coherent logic and a level of consensus that may not be empirically demonstrable. It is unclear what added value scholars derive from this a priori treatment of knowledge as common or of desires to conform as given. One justification might be, as Laitin points out, that "if a model has observable (and testable) implications, it can be empirically supported without direct information on the values of the independent variable (in this case, the existence of common knowledge)."12 Yet scholars may thereby impute the presence of common knowledge when it does not exist or when degrees of common knowledge more accurately reflect citizens' experience. Indeed, such studies often produce arguments that rely on the assumption of common knowledge in order to prove it. By assuming deeply embedded understandings rather than showing their existence, scholars tend to produce static, synchronic arguments that do not register transformations in levels, or fractures in systems, of knowledge. Moreover, Chwe's version of common knowledge is sometimes generated by "cultural practices," such as rituals or performances, and sometimes seems to be what culture means. His reliance on a Geertzian understanding of culture makes the work vulnerable to the conceptual confusions, empirical troubles, and theoretical limitations discussed above. In other words, "common knowledge" often operates as a fixed, frozen, "always already there" category, much like a Geertzian script or schema does.

Political scientists' reluctance to tackle post-Geertzian theorizations of the concept forecloses posversions of political culture, appreciative of Geertz and

Contemporary work on culture in anthropology, although indebted to Geertz's cultural anthropology of the 1960s and 1970s, also acknowledges important critiques of that tradition. Recent years have seen analysts, influenced by practice theory in anthropology, challenge culture (in its abstract sense) as a seamless system of meanings whose consistency is logical and resistant to change. Anthropologists inspired by works as diverse as those of Michel Foucault, Pierre Bourdieu, Jacques Derrida, and Michel de Certeau have emphasized the fragility, ambiguities, and historical ruptures evident in symbolic systems.<sup>13</sup> When examining semiotic practices, these theorists have invited us to see practices, texts, and images as signs whose meanings are both fixed by conventions and also always at risk—part of overlapping semiotic systems open to various interpretations and saturated by complicated, contentious relationships of power. "Power," despite the term's considerable conceptual fuzziness, becomes more than just "leverage" in these accounts. It is many-sided, elusive, and diffuse (Comaroff and Comaroff 1991). To study culture in the critical anthropology sense is to explore the processes of meaning-construction in which people's practices and their material realities—their political, economic, and social situations—operate in dialectical relationship with their systems of signification. By "dialectical" I mean a relationship in which actors' practices and their systems of signification do more than merely influence each other. Practices and

<sup>13</sup> Despite the different epistemological orientations of these theo-

rists, they are often grouped together under the vague rubric of "post-

modernism" or, sometimes, "poststructuralism." Anthropologists, in

rational choice, or dismissive of the culture concept altogether—would benefit from becoming familiar with an anthropological, diachronic, practice-based notion

sibilities of learning from, and contributing to, current work on culture. This reluctance may have something to do with the unfamiliarity of the language used, particularly in poststructuralist studies of culture. In addition, the disavowal of modernization theory in political science has not been as total as it was in anthropology. Nor have political scientists engaged in the self-reflexive work on knowledge production that has animated research in other disciplines. The focus on the mentalité of the researcher among 1980s anthropologists—which is often what self-reflexivity entailed—dissuaded political scientists from reading anthropology, as did political scientists' preferences for conceptual parsimony over the complicated, messy narratives of anthropological inquiry. Attacks on positivist social science generated by poststructuralism may also have driven away some political scientists. Whatever the reason, all students of politics-whether dependent on Parsonian

particular, have been inspired by Bourdieu's theorizations of practice in Outline of a Theory of Practice (1977) and The Logic of Practice (1990), but Bourdieu's own ethnographic work remains structuralist in its execution—identifying the systems of parallels and oppositions that reveal the structure of a society. Emphasizing ambiguities and historical ruptures has led some practice-oriented anthropologists to cite passages from Foucault's The History of Sexuality, Volume One (1978) that stress resistance, although there is nothing inherent in a study of practices (or in Foucault's work) that makes this necessary or even obvious. For a particularly sophisticated example, see Comaroff 1985. In Comaroff and Comaroff 1991 this emphasis on resistance is coupled with a study of the workings of colonial ideology and "hegemony," inspired, in part, by Gramsci's (1971) Selections from the Prison Notebooks. Postcolonial studies more generally invoke the term "practices" and investigate the dynamics of power and resistance to colonial domination, but most scholars assert the power of discourses rather than the ways in which such discourses actually operate in practice. James C. Scott's (1985, 1990) work in political science may also be viewed in the resistance tradition, as can the projects emerging out of subaltern studies. For an essay surveying the literature and critical of romanticizing resistance, see Abu-Lughod (1990, 41-55). Recent studies in practice-oriented anthropology (and sociology) have begun to reverse the trend, minimizing the role of resistance and focusing on the ways in which scientific and social practices generate hegemony. These works are also beholden to passages in Foucault's History of Sexuality, as well as to his theorizations of power in Discipline and Punish (1979). Nadia Abu El-Haj's (2001) Facts on the Ground is exemplary, demonstrating how the practice of archaeology and its disciplinary dynamics work to substantiate historical claims and remake conceptions of territory in Israel.

<sup>&</sup>lt;sup>12</sup> Personal communication with the author.

signification are defined and generated in reference to each other, yet can come into conflict, both conceptually in their meanings and causally in the world, so that the only way of handling such material is by synthesis—i.e., by maintaining an overview that includes both sides without stifling the conflict or denying their logical incompatibilities.<sup>14</sup> As we shall see, a dialectical understanding of culture allows us to view meaning-making activities as being both stable and changeable, both a single system and internally various and conflicted, an aspect of both structure and agency, both (potentially) an independent and a dependent variable, depending on the research question and strategy adopted. This conceptualization connotes dynamism rather than stasis and allows for inconsistency rather than simply implying strict coherence.<sup>15</sup> Culture in these accounts does not refer to essential values that identify a particular group or to particular traits that isolate one group from another. Rather, culture designates a way of looking at the world that requires an account of how symbols operate in practice, why meanings generate action, and why actions produce meanings, when they do. Such a version of culture does not require forsaking parsimony or the generalizing impulses many political scientists value. Focusing on semiotic practices dialectically may require, however, a theorization of how specifiable contradictions and ambiguities themselves work to produce political order, stimulate change, or generate leverage in negotiations.

It would be tempting to see this view of culture as mapping neatly on to the familiar structure-agency binary. Indeed, practice theorists themselves often argue that practice is "not an antagonistic alternative to the study of systems or structures, but a necessary complement to it" (Ortner 1984, 147). I want to argue somewhat differently: Systems of signification and practice entail both structure and agency. The word "systems," of course, implies structure, but the language and symbols constitutive of any "system of signification" are created, reproduced, and subverted by agents speaking and acting in the world. I am not sure that there can be human signification without agency people doing the work of interpreting and making intelligible signs. We nevertheless reproduce ourselves as agents or "subjects" within the confines of institutional and semiotic "structures," what game theorists call "choice under structural constraint." Practices, moreover, often have a structure to them (e.g., habits, routines, and institutional roles) at the same time that they refer to agents acting in the world, as the term "practice" suggests. Practices are actions or deeds that are repeated over time; they are learned, reproduced, and subject to risks through social interaction. Practices,

like actions (as opposed to "behaviors"), are also, in the sense that I use the term, unique to human beings. Like actions, they involve "freedom, choice, and responsibility, meaning and sense, conventions, norms and rules" (Pitkin 1993, 242). They may be self-consciously executed, but they need not be. They tend to be intelligible to others in context dependent ways. Practices, like human actions, are ultimately "dual," composed both of what "the outside observer can see and of the actors' understandings of what they are doing" (Pitkin 1993, 261). What a practice approach has made possible in anthropology is an attention to politics, to social asymmetry, historical contingencies, and political domination, key dimensions of both action and structure (Ortner 1984, 147). In contrast, the way the concept of culture has generally been understood in political science has limited its utility for political analysis. To the extent that "culture" suppresses lived political experience in its Parsonian, Huntingtonian, and Geertzian formulations, it sacrifices explanatory power.

Our conceptualizations have constrained our way of knowing and the kind of work we do. The concept of "political culture" or "common knowledge" with which most political scientists operate presupposes an internal coherence and stability that is indefensible empirically. My objective is to shift our conceptualization away from culture as a fixed system of meaning to culture as the practices of meaning-making through which social actors attempt to make their worlds coherent. <sup>16</sup> In Part Two, I show that by adopting a notion of culture as semiotic practices, political scientists can ask novel questions, use new kinds of evidence, embrace fresh perspectives, and develop original answers to concerns of abiding relevance to politics.

### PART TWO: THE POLITICS OF INTELLIGIBILITY

## Thinking Through Practices of Meaning-Making

Understanding semiotic practices requires an analysis of the ways in which people use words, establish and interpret signs, and act in the world in ways that foster intelligibility. Intelligibility, in turn, works on multiple levels. Certain kinds of practices are intelligible and their meanings can be ascribed and described without much knowledge of language and context. The political theorist, Hanna Pitkin, whose work draws on ordinary language philosophy, gives one example. We might begin by saying, "I don't know what they mean to be doing, but I can see that in fact their movement scatters those seeds in fertile spots, and later they harvest the fruit. It may be a game or a religious ceremony or something else, but in fact they are planting" (Pitkin 1993, 258). To discover whether the scattering of seeds is a game, a religious ceremony, or something else, ethnographic fieldwork or survey research data or both

 $<sup>^{14}\,\</sup>rm I$  am grateful to Hanna Pitkin for suggesting that I bring this theme to the fore.

<sup>&</sup>lt;sup>15</sup> Recent essays on "culture" in social movement theory often emphasize the term's contestatory elements. But we do not learn what culture means or what would make a culture one culture (rather than two or 12). Nor do we have a sense of what would make a symbolic system one system (and systematic) to the extent that it is. We learn only that "culture" is not static. See, for example, Johnston and Klandermans (1995).

<sup>16</sup> This formulation is beholden to an anonymous reviewer, to whom I am grateful, at American Political Science Review.

may be required. We would thus be able to consider the attitudes of those who partake in the practice, the language they use to describe it, and the fieldworker's interpretation of what is transpiring. We might conceive of political practices similarly by saying: I don't know what they mean to be doing, but I can see that in fact their movement takes a pen and checks off a box with a name beside it on a piece of paper, deposits that paper in a box, and later they tally the number of times each name is checked off and the one with the most votes makes political decisions for the next four years. It may be a game, a religious ceremony, a farce, a political event, or something else, or it may be a combination of these things. In many cases, what informants say they are doing and what the social scientist claims they are doing are not either/or choices. Rather, informants are "doing one by way of the other" (Pitkin 1993, 259). Social scientists must be able to know and to show that their interpretation is based on a grasp of native intelligibility, that in checking off a ballot the citizen is affirming the community's norms, or voting, or both, or neither. To demonstrate that voting is a way of affirming the community's norms, social scientists may have to relate the practice to local concepts, texts, and traditions. They may also check whether such practices actually work to affirm the community's norms by examining the practice's effects—the ways in which such practices are negotiated by, and generate consequences for, those who participate in them. How social scientists deal with ambiguity, complexity, and the fact of multiple significations will depend on the questions asked and the objectives desired. Although multiple significations often exist, they are not limitless, as the examples of scattering seeds or checking off a ballot make obvious. The contexts within which an action occurs help determine the range of significations that are possible and pertinent.

The advantages of conceiving of meaning-making practices in terms of levels of intelligibility are as follows: Intelligibility does not presuppose grasping an inner essence or getting into the heads of informants who are captive minds of a system but, rather, centers on the ways in which people attempt to make apparent, observable sense of their worlds-to themselves and to each other—in emotional and cognitive terms. In stark contrast to grasping an inner essence, such a conceptualization of culture and of meaning requires thinking pragmatically, discovering what we know (that seeds are beings scattered or ballots are being checked and counted) and what we need to know (what work this seed scattering or ballot tallying is doing, for example), even when we have only a minimal familiarity with context and language. It then prompts us to probe deeper, to ask questions about the conditions under which specific material and semiotic activities emerge (terrorism, for example), the contexts within which they find public expression, the work they do in the world, and the irregularities they generate in the process of reproduction. In short, the approach I am recommending generates empirical findings with observable implications of manifest importance to politics.

Contrary to the claim made by some anticulturalists that studies of culture tend toward too much specificity and are hostile to the generalizing impulses of comparative politics or of social science more broadly, the approach to culture I am recommending requires looking at multiple cases of habit and usage. These cases may be confined to a specific geographically bounded nation-state, but they certainly need not be. Studying culture should not entail insisting on a country's allegedly specific characteristics, values, or beliefs. The conceptualization of culture I am recommending would specifically exclude any such judgment. Nor need a cultural approach exaggerate the coherence of perceptions and practices that structure politics. In this increasingly information-reliant, transnational world, discrete societies, peoples, or "cultures" are far less likely to be wholly discrete than they ever were before, and it is easy to adduce historical evidence that notions of cultural isolation or "purity" have always been based more on myth or political intention than on fact. The notion of boundedness was always "constructed"—in the minds of cartographers drawing the boundaries of nation-states, for example, and by researchers' own categories of groupness or locale.

This is not to argue that geographical territories and semiotic practices are never correlated. There may at times be what Sewell (1999, 49-50) calls a "thin coherence"—a variable, contested, incompletely integrated way in which the inhabitants of a specific territory share a set of semiotic practices. It is probably easy to agree, for example, that people who live in France are by and large committed to some form of republicanism. Any political analysis that seeks to discuss the relationship between republicanism and Frenchness must take into account the following: (1) Republican ideas can come to stand for Frenchness because of the ways in which they have been used (by politicians, historians, and advertisers) to objectify what it means to be French (see Handler's [1988] study of Quebec); (2) non-French people may also subscribe to republican ideals; (3) not all French people adhere to republican ideals; (4) not all French people interpret republicanism or understand its significance in the same way; (5) antirepublican French people may not have the same relationship to republicanism as do antirepublican thinkers and citizens elsewhere, but they may; and (6) it is not clear who counts as a "French" person. Recognizing these possibilities invites theorizing about the historical relationship among regional political practices, nation-building policies and imagery, and the production of republican ideals in France, while also facilitating comparisons and contrasts with other groups or geographical locations. Semiotic logics are themselves an effect of people's actions, institutional power, and historical circumstances. State institutions, like theoreticians of culture, may, in Sewell's (1999, 57) words, "subject potential semiotic sprawl to a certain order—to prescribe (contested) core values, to impose discipline on dissenters, to describe boundaries and norms-in short, to give a certain focus to the production and consumption of meaning."

An understanding of meaning-production as a process through which conventions become intelligible to participants through observable usages and effects suggests that meanings are open to various and changing interpretations, while also sometimes appearing to be overly coherent, fixed, or inevitable. The analyst's task, then, may not be to specify the relationships that govern this semiotic logic (structuralism), or to search for silently intended meanings (hermeneutics). but rather to identify the range of semiotic practices relevant to explanations of a given political phenomenon and explore how such semiotic practices work. Consider, for instance, the study of patriotism in the United States. We might select pledging allegiance to the flag as one semiotic practice in the range a scholar investigates in studying patriotism in the United States. We would want to do more than analyze its content or infer symbolic patriotism from its family resemblance to flag ceremonies elsewhere. We would inquire into the effects of the relationship between pledging allegiance and patriotism, a task that calls for a number of additional studies. We might research the history of pledging allegiance, including the mechanisms by which the ritual was enforced over time. We might observe the practice ethnographically in areas selected for their varying regional, ethnic, racial, class, and political affiliations. We might conduct open-ended interviews and surveys, asking a wide variety of people about the meanings they attribute to pledging allegiance and the effects it produces in them: Was the flag salute mind-numbing, uplifting, apathy-inducing, or irrelevant? Finally, we might collect transgressive materials, such as evidence from court cases and protest movements, as well as source materials from "popular culture" media, such as newspaper reports, films, jokes, cartoons, and songs, that may offer alternative ways of seeing the pledge of allegiance. Such an analysis would allow us to discern whether the pledge of allegiance could be a banal, routinized practice, an activity invested with and productive of patriotism,

Although the meanings people might attach to a particular practice such as pledging allegiance to the flag are multiple and unstable, to be intelligible—by definition—they need to be recognizable by others. As Ferdinand de Saussure argued, the meaning of a sign is a function of its contrasts with other signs in a semiotic system. People form a semiotic community to the extent that they recognize the same set of contrasts and therefore are able to engage in mutually comprehensible symbolic action. Presistance and obedience are intelligible insofar as they make reference to this shared set of oppositions, without which political activities or speech acts would hardly make sense. Saussure's account may exaggerate coherence, but his insight—that intelligibility requires both a minimally shared set of

relations among signs and a group of people able to recognize them—is critical for our thinking about the political import of meaning-production (Sahlins 1985, 143–56; Saussure 1959; Sewell 1999, 23–24). Intelligibility does not imply that linguistic or semiotic meanings are stable, but it does require at least enough stability so that what one actor learned still applies when another speaks. Put differently, intelligibility suggests that instabilities in discourse and in practices make sense only within the signifying operations of a shared conceptual system (Saussure 1959; Sewell 1999, 50; Wedeen 1999, 85).

Initially, this formulation of intelligibility may seem similar to a "common knowledge" approach, but intelligibility differs from common knowledge in at least two fundamental ways. First, "intelligibility" refers to conditions that are observable rather than assumed. Second, intelligibility connotes a minimalist sense of what is shared rather than a highly integrated one; a common conceptual system (intelligibility) is not the same as a shared episteme ("common knowledge"). When we see children pledging allegiance to the flag in elementary school, we do not think that they are ordering an ice cream soda at the drugstore. The words that they utter signal that they are reciting an oath of loyalty to the United States and that the flag symbolizes the United States. We do not know whether they experience this particular recitation as an avowal of their patriotism or indeed whether they ever have such feelings. We do know, however, because of our shared experiences of language acquisition, that their action is intelligible as an outward demonstration of allegiance. Wittgenstein argues that we learn the meaning of words such as "flag" and "allegiance" through other people's uses of words in contexts such as pledging allegiance to the flag. According to Wittgenstein (1958, 225) "What 'determining the length' means is not learned by learning what length and determining are; the meaning of the word 'length' is learnt by learning, among other things, what it is to determine length" (Wittgenstein 225). Similarly, the meaning of the word "flag" is learned by learning, among other things, what it is to pledge allegiance to it.

To summarize, "meaning" connotes intelligibility, which is produced through and compounded by repeated, context-dependent use that is observable. Language and symbols are intelligible insofar as they are made manifest through practices. Practices make sense because they are reproduced historically and conceptualized through language. Practices and signs may be "thinly coherent" (Sewell) in the sense that they relate differentially to other signs (Saussure) and yet have a recognizable range of applications (Wittgenstein). Yet they rarely exhibit the sort of highly integrated, logical consistency attributed to them by structuralists or by semioticians such as Geertz. Attention to dynamism, risk, misunderstandings, ambiguity, and historical encounter calls for an analysis of the effects of semiotic practices: the ways in which, for example, official rhetoric in Syria or negative political advertisements in the United States affect people's actions and interpretations, which, in turn, play a

<sup>&</sup>lt;sup>17</sup> Saussure's (1959, 14) concerns were with language, which he saw as "the social side of speech, outside the individual who can never create nor modify it by himself; it exists only by virtue of a contract signed by the members of the community." For his discussion of the nature of the linguistic sign, see pp. 65ff.

role in determining future actions. Systems of signs are inscribed in material, observable practices; semiotic practices produce material effects, the observable implications of which are so important for positivist social science. And material effects reproduce systems of signification, which are communally intelligible and therefore open to interpretation.

#### **Applying Semiotic Practices**

How might this understanding of culture as the dialectical relationship between people's practices and systems of signification be applied as an "explanatory" or "independent" variable in current political science research? Through an investigation of two examples—compliance and ethnic identity-formation—I show how culture (as semiotic practices) can be used in causal analyses.

First, in Ambiguities of Domination: Politics, Rhetoric, and Symbols in Contemporary Syria, I (Wedeen 1999) examine the ways in which a particular set of semiotic practices (in this case, patently spurious official speeches and the ironic distancing strategies of the citizenry) works to produce political compliance. The object in that study was the "cult" of Syrian President Hafiz al-Asad—all of the rhetorical practices and official imagery that substituted for discussion of substantive political issues in public. For much of Asad's rule (1970–2000) his image was omnipresent. In newspapers, on television, and during orchestrated spectacles, Asad was praised as the "father," the "gallant knight," even the country's "premier pharmacist." Yet most Syrians, including those who created the official rhetoric, did not believe its claims. The book asks, Why would a regime spend scarce resources on a cult whose rituals of obeisance are transparently phony? The answer: Because it works. The book concludes that Asad's cult operated as a disciplinary device, generating a politics of public dissimulation in which citizens acted as if they revered their leader. By inundating daily life with tired symbolism, the regime exercised a subtle, yet effective, form of power. The cult worked to enforce obedience, induce complicity, isolate Syrians from one another, and set guidelines for public speech and

Studying "culture" as semiotic practices with political effects can lead to surprising findings. Contrary to conventional wisdom, the rhetoric and symbols of Asad's cult did not produce "legitimacy," "charisma," or "hegemony," enabling political leaders to win support for themselves and their policies by fostering collective ethnic, national, or class identifications. Yet Asad's cult was neither epiphenomenal nor unimportant. A focus exclusively on material concerns does not explain why the Syrian government expended exorbitant sums of money and scarce material resources on symbolic production, instead of marshalling its limited funds for either increases in punitive enforcement or the positive inducements that goods and services could offer. Ambiguities of Domination shows how official rhetoric and images not only exemplify but also produce power for a regime. Asad's cult cluttered public

space with monotonous slogans and empty gestures. draining citizens' political energies. The insinuation of formulaic rhetoric and self-serving state symbolism into the daily lives of citizens habituated people to perform the gestures and pronounce the slogans constitutive of their obedience. Representations of power and obedience in Syria also operated to generate power and obedience by disseminating credible threats of punishment. Although threats, to be credible, must at least occasionally be carried out, in general they suffice to ensure the compliance of most citizens. In coercive compliance, people obey because they fear being punished. The images of citizens delivering panegyrics to Asad's rule, collectively holding aloft placards forming his face, signing oaths in blood, or simply displaying pictures of him in their shop windows communicated to Syrians throughout the country the impression of Asad's power independent of his readiness to use it. And the greater the absurdity of the required performance, the more clearly it demonstrated that the regime could make most people obey most of the time. Studying Syrian "political culture" in this sense does not entail identifying the traits that inhere in Syrians, but investigating the rhetorical practices and symbols that generate compliance for the regime.<sup>18</sup>

On the basis of ethnographic research, I demonstrate that Syrians under Asad both recognized the disciplinary aspects of the cult and found ways to undermine them. The fact that so many tolerated, politically critical cartoons, films, and television comedies were published or circulated raises the question of why a regime would allow symbolic affronts to its official claims of omnipotence. To ask the question differently: To what extent can such individual artistic "victories" be politically effective ways to resist a regime's politics of "as if"? On the one hand, these practices were politically effective to the extent that they counteracted the atomization and isolation fostered by public dissimulation. Whereas seeing others obey may have made each feel isolated in his/her unbelief, a shared giggle, the popularity of a comedy skit, and the circulation of cartoons and transgressive stories enabled people to recognize that the conditions of unbelief were widely shared. Both permitted and prohibited methods of registering resistance were thus partially effective to the extent that they reasserted this widely shared experience of unbelief. At the moment when a joke is told and laughter resounds in the room, people are canceling the concrete isolation and atomization manufactured by a politics of "as if." They are affirming to themselves and to others their shared status as unwilling "conscripts" (Scott 1990, 15).

On the other hand, and paradoxically, it is precisely this shared acknowledgment of involuntary obedience that can make a cult so powerful. Asad's cult was powerful, in part, because it was unbelievable. Acts of transgression might counteract the atomization and isolation a politics of "as if" produces, but they also shore up another disciplinary mechanism, namely, the ways in which such a cult relies on an external obedience

<sup>&</sup>lt;sup>18</sup> For a sociological formulation of how "culture" as a repertoire or "tool kit" influences "strategies of action," see Swidler 1986.

produced through each citizen's unbelief. Asad's cult disciplined citizens by occasioning continual demonstrations of external obedience. External obedience, unlike good judgment or conviction, depends on a selfconscious submission to authority that is predicated on not believing. Recognizing the shared conditions of unbelief thus reproduces this self-consciousness, without which a politics of "as if" could scarcely be sustained. In short, such resistance might counteract the atomizing effects of a personality cult, but it also reinforces the cult's own mechanisms of enforcing obedience. As the philosopher Slavoj Zizek (1991) points out, even if people keep their ironical distance, even if they demonstrate that they do not take what they are doing seriously, they are still complying, and compliance is what ultimately counts politically.

Studying the ways in which semiotic practices produce compliance for a regime need not be confined to authoritarian cases. One could also imagine scholars of voting behavior, for example, considering the ways in which consistently false campaign promises might operate to depoliticize the electorate. Similarly, scholars of capitalism might analyze advertising campaigns, investigating how images of the "good life"—of comfort, efficiency, and love—are marketed, consumed, and resisted. Such analyses would go beyond readings of public opinion polls, campaign promises, or advertisements as texts and look both toward their effects (the sorts of reactions they stimulate) and to these various practices as themselves effects of specific, historically contingent relations of political power.

Existing political science frameworks either fail to pay attention to rhetoric and symbols, which means that they have no account of the work symbols do, or make claims about symbols that are unwarranted or untested empirically (that they generate "legitimacy," for example). As noted in Part One, some scholars use the term culture to refer to an entirely different area of inquiry—the identification of purported group traits. The way in which we conceptualize culture affects the kind of research we do and the evidence we bring to bear on our projects. Analyzing culture as semiotic practices has significant empirical and theoretical payoffs for political science. Interpreting semiotic practices overcomes the difficulties of what Timur Kuran (1995) calls "preference falsification," giving us insight into the attitudes of citizens, which may be particularly difficult to discern in authoritarian regimes. My work also allowed me to pose a puzzle that had been ignored by political scientists, namely, Why would a regime use rituals of obeisance that are transparently phony? The evidence I gathered to code unbelief—published and prohibited cartoons, underground and tolerated comedy skits, short stories, and risky political jokessuggests the utility of these materials for the analysis of lived political experience. And the process of collecting such evidence prompted new questions about the extent to which individual artistic practices could be considered resistance to the cult's mechanisms of social control. Moreover, the book's dialectical approach allows us to see how both the rituals of obeisance and the transgressive practices poking fun at political life work in tandem to generate compliance. The same dependent variable, compliance, could be explained by arguing that the cult creates charisma. But political scientists lose empirically and theoretically by failing to understand that the mechanisms shoring up the regime are both the "as if" habitual rituals and the practices of transgression. The patterns we see are not reliant on a notion of culture as fixed or natural. Rather, the fissures, tensions, and instabilities in meaning-making practices actually work to produce social order, albeit a fragile one. The explanations the book provides give us a new theory of how symbols operate, why regimes spend scarce resources on their deployment, and why political scientists ought to take such modes of social control seriously.

Turning now to the second example, recent work on ethnic identity-formation and ethnic violence in political science could produce empirically more sophisticated causal accounts and more fine-grained coding schema by taking "culture" as semiotic practices seriously. Here is one possible application: Whereas understandings of the "nation" as constructed and imagined are now taken for granted, "ethnicity" often operates in datasets as a given category of belonging. People are Hutu or Tutsi, Slavs or Germans. Consequently, some work on ethnic violence, particularly in international relations, suffers from the tautological reasoning of former "political culture" analyses: Interethnic tension is caused by the tensions of interethnicity (Brown et al. 1996). As Fearon and Laitin (1996, 715–35), point out, interethnic relations are more often characterized by cooperation than conflict, which suggests that imaginings or "constructions" of ethnicity may be more important than its seemingly objective existence. Put more radically, ethnicity may be less objectively real, or more variable, than some researchers tend to assume. Yet even scholars sympathetic to constructivism have been slow to apply its lessons, in part because the coding work entailed in generating a large, constructivistoriented dataset would be difficult to do (a subject to which we shall return).

Work by anthropologists, such as Liisa H. Malkki's (1996) "National Geographic: The Rooting of Peoples and the Territorialization of National Identity among Scholars and Refugees," suggests the political consequences of different levels of intensity in ethnic identification. Malkki's case examines forms of Hutunessvarious ways in which semiotic practices (narratives of identification and everyday activities) register experiences of belonging that are not captured in standard categorizations of ethnicity. As Malkki shows, residents of a refugee camp established in western Tanzania after the Burundi massacres of 1972 experienced themselves as "pure" Hutus, whereas Hutu-Burundi refugees living in the township of Kigoma did not. Camp refugees constructed their sense of national belonging to Burundi and their ethnic identification with Hutuness in terms of moralizing commentaries about heroism and homeland. In contrast, town refugees championed a rootless and mobile cosmopolitanism—a creolized "impurity." They were not essentially Hutu but, rather, just "broad persons" (Malkki 1996, 446, and Eley and

Suny's [1996, 432] commentary on Malkki; see also Malkki 1995). A semiotic-practical analysis of ethnic identity-formation would compare the relationship between everyday practices and the rhetoric of belonging within refugee camps with the language and everyday practices of those outside the camps. For formal modelers or the quantitatively minded, developing a dataset based on an intensity scale accounting for people's experiences of identification would produce a more precise and generalizable explanation of how the lived conditions of ethnic identity-formation might determine conflict when they do. Attention to the production of cosmopolitan understandings might also help to explain the absence of ethnic conflict in cases where such identifications are weak.

Coding ethnic groups is an inherently perilous enterprise. The importance of particular identifications changes over time, yet scholars have tended to rely on "objective" measures that are one-dimensional, such as linguistic or religious affiliations. These markers may have little to do with people's experiences of identification. Authoritative compendia of linguistic or religious distinctions may suggest the existence of groups whose members do not see themselves as a community or whose shared language or religion have no political salience. Yet because a research project may depend on specifying potential ethnic groups, scholars have to develop criteria for thinking about what makes a group a group and under what conditions experiences of political identification might crystallize along, say, ethnic lines

One promising way to improve on, if not avoid, the estimate bias bedeviling datasets such as Ted Gurr's (1997) MAR one, is to think about degrees of ethnicity—of Hutuness or Tutsiness or Kurdishness or Irish American-ness. To do that, a scholar could first list the range of identifications that might take on political salience, given specifiable criteria, while explaining why others are unlikely to do so. Thus, at the very least we would have to come up with reasons why coding the intensity of ice cream eaters or Pittsburghers would seem silly, while coding the intensity of Hutus and Tutsis would not. Harder to justify is the inclusion or exclusion of various linguistically distinct subgroupings of Ashantis in Ghana or of Spanish-speaking Californians in the United States, but a semiotic practical approach invites those studying "identity" issues to research the conditions under which certain practices take on political meaning and intensify political claims of group affiliation.<sup>19</sup> Listing actual communities and potential ones in terms of the intensity of groupness for a large dataset might require, as Matthew Kocher has argued, treating ethnic or nationalist identification as a phenomenon that cannot be measured directly. but only inferred from a correlation matrix. Factor and principal components analysis might be used to

measure the intensity of identity indirectly, through a specification of factors or components that are measurable.<sup>20</sup>

For example, we might have theoretical reasons to think that interstate war affects nationalist sentiment and thus use it as one factor. But we might also have sound theoretical justifications for arguing that it is the threat of interstate war that consolidates nationalist sentiments. We might then consider factors of a semiotic-practical nature, such as narratives of conspiracy or threat and the impact these have on citizens. That impact might be registered in newspaper reports, protest movements, the formation of organized groups, and political speeches, songs, sporting events, and television serials. Ethnographic and historical work might also be used to check various cases, to see, for example, how the categories of Hindu and Muslim have changed from 1850 to the present, so that a dataset on Indian riots or one that incorporated intensity measures could account not only for violence, but also for the shifting relevance of appeals to ethnicity in riots. We might look for evidence of intensity in the content of stateinitiated formulations of national identity in laws and public spectacles. A semiotic practical approach would also require us to register the observable effects these have on various populations of citizens, perhaps by conducting surveys. In addition, we might supply theoretical reasons for how the presence or absence of catalyzing events, such as September 11, strengthens nationalist feelings and use that as a factor; a semiotic practical approach could help us determine what counts as a catalyzing or traumatic event. The location of a population in a poor, resource-deprived area could also be an indicator of group intensity. Malkki's work on refugees suggests that continual, quotidian experiences of severe poverty can induce intense feelings of groupness, although these may not be articulated along explicitly economic lines. Indeed, political economists who assert that the poor as a group are prone to revolt when they have nothing to lose might explain variations in actual, organized revolts among "the poor" by considering the role semiotic practices play (Boix n.d.; Lipset 1959, 1960; Stokes and Boix n.d.). What work is done by myths such as the Horatio Alger story, for example, in reproducing convictions that economic conditions can be ameliorated through individual effort rather than through collective action? By taking culture as semiotic practices seriously, causal accounts will be more nuanced and precise, even if an accurate coding schema for large datasets eludes social scientists intent on constructing one. Datasets that can take into account intensity in the ways sketched above should be more accurate than current ones.

<sup>&</sup>lt;sup>19</sup> I am indebted to Matthew Kocher for sharing his thoughts on ethnic identifications and his experiences attempting to recode the MAR dataset. In a private conversation, he used the example of trying to code a "subgrouping" of Ashanti in Ghana to demonstrate the persistent dangers of estimate bias and of infinite regress.

<sup>&</sup>lt;sup>20</sup> Mathew Kocher has pointed out to me that the *locus classicus* for factor analysis is IQ. Like intensity of identity, we cannot measure intelligence directly, so scientists have devised a number of tests that operate as "functions of intelligence." A relevant example of confirmatory factor analysis is Laitin's (1998, 217–42, 392–4) use of the "matched guise" test created by Wallace Lambert. Laitin used confirmatory factor analysis to construct indices of "friendship" and "respect" out of survey responses from bilingual students in the former Soviet Union.

These examples are suggestive of how studying culture offers us new purchase on perennial and intractable issues in political science. Paying attention to symbolic displays of power, for example, provides scholars with the opportunity to understand the dynamics of political compliance and to explain why regimes spend scarce material resources on such displays. Scholars can document empirically the skirmishes that take place between ruler and ruled as they are represented in the regime's idealized presentation of itself and in people's reception of it. They can also theorize the ways in which symbols themselves create, sustain, and undermine the disciplinary circumstances through which any regime exercises some of its power. Studying semiotic practices generates explanations of how political identifications are formed, instances of groupness crystallized, and alternative possibilities of belonging foreclosed. Investigating semiotic practices can also help scholars to establish important criteria for differentiating passionate forms of solidarity from vague, mildly constraining experiences of "affinity and affiliation" (Brubaker and Cooper 2000, 21). Establishing such criteria would enhance studies of nationalism, ethnic conflict, identity-formation, collective action, and hegemony. A semiotic practice-oriented approach can also assist in answering important questions such as, When will a subversive organization invoke ethnicity to activate violence? How intense are people's identifications in particular nation-states? When will states experience violence from groups who claim ethnicity? When will organizations that claim to represent ethnic groups form? When will they be successful at mobilizing support around ethnic or national claims? and How do groups manage to gain public support and to get their claims taken seriously? A semiotic practice-based approach also draws our attention to the problems of presuming ethnicity as an objective marker. Large datasets using objective categories suffer from selection bias toward conflict (Fearon and Laitin 1996). An intensity measure, devised through a combination of statistical techniques and ethnographic ones, might produce more reliable large datasets or, at least, point scholars in new directions. Generalizable arguments about the conditions under which ascriptive identifications get produced, or become the basis for organized resistance, or rigidify in state institutions focus attention on the meanings of ethnicity in practice, thereby acknowledging some of the actual complexities of political identification, without forsaking commitments to causal stories or large-n work.

#### **CONCLUDING REMARKS**

The gulf between interpretivists and rational choice theorists may be too wide to bridge. In many ways, the concerns of rational choice theorists and interpretivists are simply incommensurable. Epistemological commitments to uncertainty, ambiguity, and messiness invite interpretivists to focus on social movements, political resistance, and modern power in ways that are irrelevant to rational choice theorists. Similarly, epistemological concerns with stability, order, and governance make those who emphasize the "science" part of the discipline or who look to economics for inspiration less compelling to interpretivists than philosophers and anthropologists are. For those with an interest in culture on both sides of the divide, however, there is no reason not to move beyond the traditional understanding of political culture. A semiotic practices approach avoids the ahistorical, empirically untenable formulation of culture currently invoked by political culture and some rational choice theorists. And it gives us explanatory purchase on key dependent variables, such as compliance and ethnic identity-formation. Researching dynamic semiotic practices enables both accounts of general political processes and nuanced causal arguments about particular cases in ways that are more theoretically robust and empirically accurate than mainstream formulations of culture in political science currently permit.

# Preferable Descriptive Representatives: Will Just Any Woman, Black, or Latino Do?

SUZANNE DOVI University of Arizona

body of theoretical literature has developed that explains why historically disadvantaged groups should be represented by members of those groups. Such representatives are commonly referred to as descriptive representatives. This literature has also endorsed various institutional reforms aimed at increasing the number of descriptive representatives, e.g., party list quotas, racial districting, and proportional representation. However, this literature does not articulate criteria that should guide the selection of descriptive representatives to serve in these institutional positions. Indeed, some thinkers claim that such criteria cannot, or at least should not, be articulated. I argue that some descriptive representatives are preferable to others and that criteria for selecting preferable descriptive representatives can, and should, be articulated. Moreover, I recommend one such criterion: Preferable descriptive representatives possess strong mutual relationships with dispossessed subgroups of historically disadvantaged groups.

emocratic political institutions are often evaluated by the gender, ethnicity, and race of elected representatives (e.g., Guinier 1994; Paolino 1995). Implicit in these evaluations is the assumption that democratic political institutions that lack any representatives from historically disadvantaged groups are unjust. Moreover, these evaluations often assume that an increase in the number of representatives from historically disadvantaged groups can contribute to the substantive representation of those groups (e.g., Thomas 1991). For example, 1998 was declared the "Year of the Woman" in the United States because in that year the number of women in the House leaped from 28 to 48, and that in the Senate from two to six. This method of evaluating democratic institutions often assumes that the more women, Blacks, and Latinos, the better for democratic institutions.<sup>1</sup>

These assumptions justify the political practice of setting aside certain political and institutional positions for members of historically disadvantaged groups. These positions are specifically designed to increase the number of representatives from historically disadvantaged groups—that is, the number of what I call "descriptive representatives." Contemporary political theorists have directly and indirectly supported these assumptions by offering several explanations for why political representatives for a historically disadvantaged group should come from that group (e.g., Mansbridge 1999; Phillips 1995; Sapiro 1981). In their terminology, they have advanced reasons to think that "descriptive representation," "group representation," "the politics of presence," or "self-representation" is important.<sup>2</sup>

Although the reasons they advance differ significantly. these theorists sound a common theme: To be fully democratic, a society that has denied full political membership to certain groups must be strongly committed to including those groups in its political life. Such a commitment, at least in many circumstances, requires society to take active steps to increase the number of descriptive representatives. On these grounds, these theorists endorse various institutional reforms such as party list quotas, caucuses, racial districting, and schemes for proportional representation. But these theorists have said remarkably little about the criteria that should guide democratic citizens in their choice of descriptive representatives.<sup>3</sup> The emphasis of this literature so far has been on establishing the need for the presence of some descriptive representatives, not on investigating criteria for identifying preferable descriptive representatives.

Which members of historically disadvantaged groups are preferable representatives for those groups? My primary aim is to argue for the need for criteria that will help answer this question. I take the value of having descriptive representatives in public positions as a given.<sup>4</sup> I advance existing discussions of group representation by explaining how democratic citizens should choose among various possible descriptive representatives. Toward this end, I propose one criterion for identifying preferable descriptive representatives: Preferable descriptive representatives have strong mutual relationships with dispossessed subgroups. I purposely set aside the question of whether descriptive representatives should be evaluated by the same or different criteria as other representatives in liberal democracies. 5 I focus on a different question: Are there any criteria for guiding

citizens who possess more privileged social locations.

The need for institutional reforms aimed at increasing the number of descriptive representatives for a certain historically disadvantaged group may be temporary. These reforms may be dropped, if and when the society has advanced to the point where a historically disadvantaged group is no longer politically marginalized.

<sup>&</sup>lt;sup>5</sup> I agree with Iris Marion Young's position (2000) that the difficulty in choosing descriptive representatives—what she calls the problem of one person representing the many—is a problem for all

the appointment, nomination, or election of members of historically disadvantaged groups to positions that were created to increase the diversity of actors in the political arena and thereby the substantive representation of such groups? In other words, are there any principled reasons for preferring one *descriptive* representative to another? I offer my criterion to provide guidance for such decisions and to be more explicit about the political commitments that underlie a politics of presence. To put my position boldly, a commitment to a politics of presence would be more likely to support robust democratic relations if descriptive representatives were selected on the basis of their mutual relationships with dispossessed subgroups.

## CONSTRUCTING A POLITICS OF PRESENCE: BUILDING AROUND A TENSION

Hannah Pitkin's classic work The Concept of Representation has set the terms of the debate over descriptive representation. For Pitkin, descriptive representation concerns what representatives "look like," rather than what they "do." For this reason, Pitkin (1967, 89) proclaimed that arguments for descriptive representation have "no room for representation as accountability." This line of reasoning—that a politics of presence is somehow incompatible with accountability—has defined the theoretical problem facing proponents of descriptive representation. Early attempts to articulate the need for members of historically disadvantaged groups to represent those groups focused on the conflicting interests of privileged and relatively less privileged groups. Most notably, Virginia Sapiro (1981) showed that trusting some groups to protect another group's interests, e.g., letting husbands take care of their wives' interests, was and continues to be foolhardy. The recurring betrayals of historically disadvantaged groups by relatively privileged groups partially explain why traditional mechanisms of accountability are insufficient. By emphasizing the conflicts between advantaged and disadvantaged citizens, Sapiro laid the theoretical groundwork for a politics of presence. She did so by standing Pitkin's point on its head: Democratic accountability sometimes requires descriptive representation.

Following Sapiro's lead, a rich theoretical literature has developed that defends the intuition that the chronic underrepresentation of women and ethnic minorities is a problem. Anne Phillips (1998, 228) has, very helpfully, laid out four groups of arguments about why descriptive representation matters. The first of these, which Phillips calls "the role model argument," claims that members of historically disadvantaged groups benefit from seeing members of their group in positions

of power. Having a woman in office increases other women's self-esteem and their capacity to assume leadership roles. Second, Phillips maintains that descriptive representatives are needed to compensate for past and continued injustices toward certain groups. According to this second argument, past and present betrayals by privileged groups create a belief that trust can be given only to descriptive representatives. The presence of descriptive representatives can partially compensate for those betrayals. She refers to this second argument for presence as "the justice argument." The justice argument examines patterns of inequality to reveal the need for descriptive representation. Her third argument focuses on "overlooked interests." According to this argument, group representation allows historically excluded groups to get onto the political agenda their perspectives, issues, and interests that had been previously ignored. Deliberations about public policy will be improved by having a more diverse set of representatives. Finally, Phillips advances the "revitalized democracy" argument, which asserts that a commitment to diverse representation is necessary for increasing political participation and strengthening the legitimacy of democratic institutions.

Dismissing the role model argument as uninteresting and without bearing on democratic politics (Phillips 1995, 63),6 Phillips devotes much of her attention to the remaining three arguments. Her work reflects a tendency in the literature on group representation as a whole to stress the value of group representation for considerations of justice, for deliberation, and for revitalization of democratic institutions. For present purposes, I focus primarily on justice arguments—that is, arguments that unfair patterns of inequality indicate a need for an institutionalized voice. These arguments appeal to evidence ranging from formal political exclusions (e.g., the disenfranchisement of certain groups) to economic disparities (e.g., mean incomes falling below the mean incomes of other groups). Such evidence challenges the assumption that all groups in liberal democracies enjoy the political equality that democratic commitments demand. Appealing to this evidence, theorists of group representation assert that justice demands paying particular attention to those in liberal democracies who are worse off. In doing so, they invoke the spirit of John Rawls's difference principle  $(1971)^{7}$ 

Theorists of group representation unambiguously acknowledge that despite the importance of descriptive representation, some descriptive representatives fail to further, and can even undermine, the best interests of historically disadvantaged groups. For instance, Melissa Williams (1998, 6) states that "it would be absurd to claim that a representative, simply

representation. The criteria for choosing descriptive representatives will overlap significantly with the criteria for choosing representatives more generally. However, descriptive representatives who have been appointed, nominated, or elected to positions aimed at increasing the substantive representation of historically disadvantaged groups have particular and unique obligations to those groups.

<sup>&</sup>lt;sup>6</sup> In contrast, I maintain that the ability to inspire and to be an example of a political leader from a historically disadvantaged group could be crucial for mobilizing that group.
<sup>7</sup> Rawls's difference principle asserts that social and economic in-

because she is a woman, therefore represents the interests or perspectives of women generally, or that an African-American representative is automatically representative of all African Americans. The mere presence of members of marginalized groups in legislatures is not *sufficient* for the fair representation of citizens from those groups, even though it is often necessary." Similarly, Phillips (1995, 157) states that "if the presumption is that all women or all black people share the same preferences and goals, this is clearly—and dangerously—erroneous." In some circumstances, a politics of presence can be undesirable. Most theorists of group representation recognize that members of historically disadvantaged groups have diverse interests and beliefs and that a politics of presence by itself is insufficient for revitalizing democratic institutions.

A tension thus emerges in the literature on group representation. On the one hand, theorists of group representation have argued that certain patterns of inequalities justify having an institutionalized voice. Such arguments emphasize the *shared* obstacles facing certain members of particular groups. Highlighting how certain groups are unfairly excluded from political life substantiates their claims that certain policy remedies are desperately needed. On the other hand, these theorists increasingly acknowledge the diversity within historically marginalized groups. This diversity can seem to undermine the presumption that certain shared experiences of oppression justify giving some groups an institutionalized voice.

Generally speaking, the literature has responded to this tension by exploring its implications for the meaning of representation as a whole. In particular, it has emphasized that representation is a dynamic process that must negotiate seemingly contradictory demands. Here the literature makes some of its most insightful contributions to democratic theory. For instance, Williams shows how the contradictory demands placed on representatives lead to understanding representation as a kind of mediation. Williams (1998, 8) identifies three dimensions of political life that representatives must mediate: the dynamics of legislative decision-making, the nature of legislator-constituent relations, and the basis for aggregating citizens into representable constituencies. Williams's understanding of representation as mediation expands the traditional conception of representation, which focuses almost exclusively on the relationship between the representative and the represented.

Iris Marion Young also offers a revised understanding of representation in response to the problem posed by diversity within historically disadvantaged groups. Young warns that attempts to include more voices in the political arena can inadvertently suppress other voices. She (Young 1997, 350) illustrates this point using the example of a Latino representative who might inadvertently represent heterosexual Latinos at the expense of gay and lesbian Latinos. For Young (1997, 351) the suppression of differences is a problem for *all* representation. Representatives of large districts or of small communities must negotiate the difficulty of one person representing many. Because such a

difficulty is endemic to all representation, the legitimacy of a representative is not primarily a function of his or her similarities to the represented. Representation should not be characterized by a "relationship of identity."

Instead, Young uses Jacques Derrida's concept of différance to recommend reconceptualizing representation as a differentiated relationship. Derrida's concept of différance is both extremely radical and subtle. The basic idea underlying the concept of différance is the rejection of polarities or dichotomies, such as that of cause-effect. For those who think that certain distinctions are straightforward, it will be tempting to reject the concept of différance out of hand. But Young (2000, 127) finds this concept useful for capturing the dynamic process of representation: for this concept, she suggests, encourages thinking of oppositions "in terms of the trace, a movement of temporalization that carries past and future with it." Young further explains that the concept of différance promotes a way of thinking about entities in their "plurality without requiring their collection into a common identity . . . . Things are similar without being identical, and different without being contrary, depending on the point of reference and the moment in a process." Using this idea of différance, Young recommends understanding representation as a fluid relationship, instead of a "relationship of identity" between constituents and representatives.

Let me briefly explain how Young applies Derrida's concept of différance to the meaning of representation. The basic move is to argue that the differences between the represented and the representative need to be both acknowledged and affirmed. According to Young (2000, 127), "Conceptualizing representation in terms of différance means acknowledging and affirming that there is a difference, a separation, between the representative and the constituents." For Young, constituents should not look for representatives with their same identity; rather, they should look for traces of accountability and authorization. Representation should be understood as a dynamic process that moves between moments of authorization and moments of accountability (Young 2000, 129). For Young, the movement between these moments makes the process "democratic." A representative process is democratic to the degree that citizens authorize their representatives and then can hold them accountable. Assessments of representative processes will therefore partially depend on the past and future behavior of representatives. Young's description of the dynamic of representation emphasizes that citizens often cannot anticipate the issues that representatives will confront during their term in office. Democratic citizens should continuously suspend or "defer" their evaluations of representatives. Democratic citizens must assess representation dynamically, that is, assess the whole ongoing processes of authorization and accountability of representatives. Young would resist assessing a representative from any one point of reference.

Young is quite right that representation in general is a complex and dynamic process. However, something important is overlooked in the quick move from group representation to representation as a whole. Young's focus on the problems of all representation obscures the distinctive problems of representation facing historically disadvantaged groups. She loses sight of the fact that some differences between representatives and the represented are more politically relevant from the perspective of democratic theory. Some politically salient differences should not be affirmed, e.g., differences that result from unjust and systemic exclusion.8 As Young herself pointed out in her earlier work, some groups face structural obstacles. In Justice and the Politics of Difference, she described real representation as consisting of "the self-organization of groups, the group generation of policy proposals in a context where decisions makers were required to be responsive to their perspectives and a group veto regarding specific policies that affect a group directly" (Young 1990, 184). In her later work, Young (1990, 372; 2000, 144, fn 27) "defers" the question of institutional supports for group representation. Her emphasis on the problems common to all representation downplays how particular institutional supports are necessary for overcoming some structural obstacles. Her admirable concern about the ways in which such institutional supports can suppress differences among historically disadvantaged groups leads her to retract her earlier commitment to certain institutional reforms, e.g., group vetoes. Young does continue to support multimember legislative jurisdictions, caucuses, and party list quotas. Reserved legislative seats should be used as "a last resort and temporary option for representing otherwise excluded perspectives" (Young 2000, 150). Young's desire to avoid excluding certain opinions, interests, or perspectives of historically disadvantaged groups thus weakens her initial support for institutional reforms aimed at increasing the real representation of those groups.

The degree to which Young has changed her mind is of less immediate interest than how the desire to avoid suppressing differences among members of historically disadvantaged groups can prevent theorists from articulating and defending reasons for preferring certain descriptive representatives over others. Simply to affirm all differences, as Young eventually does, ignores how certain politically salient differences between different groups in society (specifically between those who have been oppressed and those who have not) can justify the need for an institutionalized voice. Consider Young's example of the Asian American, who, she claims, has the perspective of an African American. This example shows how much she has weakened the claim that a historically disadvantaged group should be represented by members of that group. If one extends one's understanding of group membership so far as to include certain Asian Americans as members of the African-American community,<sup>9</sup> then existing proposals for group representation, e.g., party list quotas, become untenable, for it is questionable whether such a person could contribute to the self-organization of an African-American community (or should count toward a party list quota for African Americans.) If Asian Americans can possess an African-American perspective and thereby satisfy the requirements of being descriptive representatives for African Americans, so can whites. Young's revised understanding of representation could legitimate an all-male (or all white) legislature as adequately representing women (or people of color) provided that they shared similar interests, opinions, and perspectives. The central claim of the literature on group representation—that historically disadvantaged groups need representatives from those groups—is seriously diluted by Young's notion of representation as a differentiated relationship.

Young's description of the dynamic of representation and her explicit recognition of the diversity within historically disadvantaged groups are useful contributions to theoretical debates about the general meaning of representation. But they provide little guidance to those confronted with the task of evaluating a particular descriptive representative. Such evaluations could be improved by articulating some general criteria for preferring some descriptive representatives to others.

## JUSTIFYING THE SILENCE ABOUT CRITERIA

Silence about the criteria for evaluating descriptive representatives is not accidental. Theorists of group representation have offered two kinds of arguments to justify their silence. I call these two arguments the autonomy argument and the contingency argument.

According to the autonomy argument, members of historically disadvantaged groups should decide for themselves who is a preferable descriptive representative. This argument assumes that autonomy is best equated with being left alone—at least in the case of a group's choice of its representatives. According to this line of thinking, respecting the autonomy of historically disadvantaged groups requires theorists to refrain from advancing criteria for evaluating descriptive representatives. This argument has two main versions. The first suggests that articulating criteria for judging descriptive representatives attributes to historically disadvantaged groups a fixed identity. The second emphasizes the autonomy of the representative.

The first version of the autonomy argument asserts that any proposed criterion for evaluating descriptive representatives presupposes that a historically disadvantaged group has an essential nature. In other words, it presupposes that that such a group has a "fixed

<sup>&</sup>lt;sup>8</sup> Democratic citizens should remain vigilant about preventing unjust and systemic exclusions. One way that they can do this is by assessing their choice of descriptive representatives in light of such exclusions. Institutional reforms aimed at increasing the number of descriptive representatives can revitalize democratic institutions if citizens select descriptive representatives based on an understanding of whose interests, perspectives, and opinions are being systemically marginalized.

<sup>&</sup>lt;sup>9</sup> I assume here that Asian Americans are not typically considered part of the African-American community. I recognize that biracial and multiracial identities might complicate this assumption. My argument does not assume an essential identity to these groups but is based on existing, historically contingent understandings of group membership.

essence given once and for all, and with traits that are homogeneously distributed among all the group members" (Gould 1996, 182). Such an assumption places undesirable constraints on the behavior of members of historically disadvantaged groups. According to Williams (1995, 6), "No defensible claim for group representation can rest on assertions of the essential identity of women or minorities; such assertions do violence to the empirical facts of diversity as well as to the agency of individuals to define the meaning of their social and biological traits." To explain why some members are less suitable descriptive representatives is to question the authenticity of those members' identity. Such explanations possess an implicit charge that "she isn't really a woman" or "he isn't really black." In this way, discussions about the criteria for selecting descriptive representatives are often interpreted as attacks on the "authenticity" of descriptive representatives. Not only are such discussions overly divisive (Jones 1993; Stasiulis 1993), but they prevent the group from determining its own boundaries. According to this first version of the autonomy argument, members of historically disadvantaged groups should define for themselves the meaning of their group identity, as well as choose their own descriptive representatives.

The second version of the autonomy argument emphasizes the autonomy of descriptive representatives. Phillips, in particular, argues that specifying the criteria for evaluating descriptive representatives would undermine the arguments for group representation. For Phillips, a politics of presence is justified because representatives have some political discretion about their political decisions. Because of this discretion, descriptive representatives should be present where political decisions are being made. To uphold standards of "strict accountability"—that is, to require descriptive representatives to act in certain ways, e.g., to endorse a particular policy—would undermine a primary reason for why certain historically disadvantaged groups need representatives from those groups: namely, that representatives are not mere puppets of their constituents but must exercise their own judgment. To suppose that there is a fixed set of criteria by which descriptive representatives should be judged is to fail to appreciate how the autonomy afforded to representatives justifies the politics of presence. According to this second formulation, it would be misguided to provide a laundry list of "good policies" that a female representative should support and to insist that preferable female representatives can vote only in ways consistent with that list. After all, male representatives could also vote according to a laundry list. The more one knows how a descriptive representative should act, the less it is necessary to have a descriptive representative. Such reasoning led Mansbridge (1999, 630) to conclude that descriptive representatives become less necessary when interests have crystallized.

The second kind of argument for remaining silent about the criteria for judging descriptive representatives is *the contingency argument*. According to this argument, it is impossible to articulate the criteria that should be used to evaluate descriptive representatives

because context matters. Some theorists of group representation, such as Williams (1998, 17), stress that particular historical developments play "an important role in defining the groups whose moral claims are strongest." Others stress that the experiences of historically disadvantaged groups defy generalizations. A priori proposals for criteria will either be irrelevant or do more harm than good. The variations across groups prevent adopting any one set of criteria. Mansbridge provides a particularly illuminating discussion of the relationship between descriptive representation and contingency. She identifies four contingent conditions that could justify preferring descriptive representatives to nondescriptive representatives: "(1) adequate communication in contexts of mistrust, (2) innovative thinking in contexts of uncrystallized, not fully articulated, interests,... (3) creating a social meaning of 'ability to rule' for members of a group in historical contexts where the ability has been seriously questioned, and (4) increasing the polity's de facto legitimacy in contexts of past discrimination" (Mansbridge 1999, 628). For Mansbridge, descriptive representatives are needed when marginalized groups distrust relatively more privileged citizens and when marginalized groups possess political preferences that have not been fully formed. She emphasizes that descriptive representatives are necessary only under certain conditions—that is, when descriptive representatives perform certain functions in certain contexts. Mansbridge's discussion provides some important insights into evaluating when descriptive representation is necessary. Implicitly, her work offers some general criteria for evaluating descriptive representatives—that is, by their ability to satisfy these different functions. However, her emphasis on identifying the contingent conditions under which descriptive representation is preferable to nondescriptive representation makes the actual choice of descriptive representatives secondary, if not irrelevant.

In summary, theorists of descriptive representation refuse to specify any criteria for evaluating descriptive representatives for two good reasons. First, they see offering such criteria as violations of the autonomy of historically disadvantaged groups and/or their descriptive representatives, and second, they view such criteria as insensitive to contextual variation. For these reasons, theorists of descriptive representation avoid a tough question: Who is a preferable descriptive representative? Answering this question is not easy, because it requires privileging the interests, values, and perspectives of certain members of historically disadvantaged groups over those of other members. Answers to this question can therefore have the effect of downplaying, if not excluding, certain interests, values, and perspectives. For this reason, answers to the question of who is a preferable descriptive representative are more likely to be disputed than answers to the question, "Why have descriptive representatives?"

#### THE NEED FOR CRITERIA

Underlying both the autonomy and the contingency arguments is a legitimate concern about who gets to

decide which criteria are best. The impulse to speak for others can be and often is paternalistic and imperialistic (Alcoff 1995). Standards for assessing political performance have often been used to disqualify historically disadvantaged groups from political participation. To articulate criteria for evaluating descriptive representatives runs the risk that those criteria can be used in unanticipated and possibly harmful ways. Some fear that articulating such criteria might also unduly influence members of historically disadvantaged groups.

Such concerns are understandable but ultimately unpersuasive. After all, to articulate such criteria is not necessarily to assume that all members of a historically disadvantaged group have some essential identity. In fact, the very real and politically relevant differences among members of historically marginalized groups point to the desperate need for a theoretical discussion of criteria. There is a difference between articulating particular policies that a descriptive representative must endorse to count as a legitimate descriptive representative and articulating general guidelines for identifying preferable descriptive representatives. For instance, theorists of group representation have agreed that institutional reforms are necessary because historically disadvantaged groups possess overlooked interests. To maintain that a descriptive representative should pay special attention to overlooked interests does not require that she possess a particular view about those interests. 10 Descriptive representatives have autonomy to the extent that she can reasonably interpret those interests in a variety of ways. However, to say that descriptive representatives can legitimately interpret their group's interests in multiple ways is not to say that anything goes. Descriptive representatives who denounce their group affiliations or who deny that they have any particular obligation to their group would fail to achieve the ends for which descriptive representation was introduced (cf. Phillips's four arguments). Descriptive representatives who claim to represent only the common good might be desirable representatives for other reasons; however, they do not satisfy Phillips's "overlooked interests" argument.

One can articulate criteria for evaluating descriptive representatives without violating the autonomy either of historically disadvantaged groups or of their descriptive representatives. To pose criteria for judging descriptive representatives is not the same as imposing those criteria on members of historically disadvantaged groups. Obviously, to impose criteria on such groups,

or on democratic citizens more generally, is wrongheaded. It is crucial according to my view that members of historically disadvantaged groups retain the ability to choose to adopt any proposed criterion.<sup>11</sup>

I would remind those who fear that articulating criteria for evaluating descriptive representatives might exercise an undue influence on a historically disadvantaged group that silence holds similar risks. After all, members of historically disadvantaged groups are not always the ones who select descriptive representatives. Privileged citizens are frequently in charge of selecting political appointees and nominating candidates for public office. To assume that not articulating the criteria for selecting descriptive representatives for committees or party lists is the best way to protect the autonomy of historically disadvantaged groups ignores the power that privileged groups currently hold. As Audre Lorde (1984, 41) aptly warned, "Your silence will not protect vou." Silence about controversial subjects does not necessarily bring about desired outcomes.

Besides, citizens inevitably bring their general standards of representation to bear on their choice of representatives. Critically evaluating the standards for descriptive representatives can facilitate deliberations by democratic citizens, thereby "assisting, and not infringing on" the autonomy of historically disadvantaged groups. 12 Articulating criteria for assessing descriptive representatives does not make the exercise of judgment unnecessary; rather, deliberations about these criteria can refine those judgments. Theorists can offer criteria for choosing among descriptive representatives and still maintain that members of historically disadvantaged groups must determine for themselves whether a specific criterion is appropriate at any particular moment. This leads to the second argument for remaining silent: the role of contingencies in evaluations of descriptive representatives.

Context undeniably does matter. Evaluations of descriptive representatives, like arguments for a politics of presence (Phillips 1995, 46), depend on "historically specific analysis of the existing arrangements for representation." For instance, who is a preferable descriptive representative might depend on whose interests, opinions, and perspectives are currently being stigmatized and marginalized by existing political norms and institutional processes. "Because group identity is orchestrated and produced in part through political institutional processes" (Bickford 1999, 86), citizens should consider the unjust effects of those processes as relevant to assessments of preferable descriptive representatives. Which descriptive representatives are preferable might also depend on the reasons that descriptive representation is necessary, e.g., to increase the trust groups have in democratic institutions or to include overlooked interests on the policy agenda.

Espousing criteria is not the same as requiring that certain criteria be applied in all circumstances. Like

<sup>&</sup>lt;sup>10</sup> Like representatives generally, good descriptive representatives should sometimes act as trustees and at other times act as delegates. The standards for good representation cannot be linked strictly to the policy preferences of the represented. Pitkin (1967, 166) expressed this point in the following way: "Neither 'follow their wishes' nor 'ignore their wishes' will do; the decision must depend on why they disagree . . . but the standard by which he [the representative] will be judged as a representative is whether he has promoted the objective interest of those he represents. Within the framework of his basic obligation there is room for a wide variety of alternatives." My criterion for assessing preferable descriptive representatives does not assume one particular understanding of the objective interests of historically marginalized groups.

<sup>&</sup>lt;sup>11</sup> A description of the conditions necessary for promoting this ability is clearly beyond the scope of this paper.

<sup>&</sup>lt;sup>12</sup> I want to thank an anonymous reviewer for helping me formulate my position in this way.

most theorists of descriptive representation, I share the suspicion of a cookie-cutter approach to evaluating descriptive representatives. It would be foolhardy to propose a set of criteria that did not consider context or that did not require individuals to use their own judgment to determine whether the criteria apply to the particular case at hand. To recognize the importance of particularities does not preclude articulating criteria for evaluation. It requires having criteria that are sensitive to those particularities.

My final argument for articulating criteria for evaluating descriptive representatives is based on my understanding of a particular role that political theory can and should play. Increasingly, the need for political theory to inform contemporary political controversies has been recognized (Isaac 1998, chap. 7). Contemporary politics is plagued by controversies about the representation of historically disadvantaged groups. Consider the controversies over the leadership of African Americans, such as Louis Farrakhan. Angela Dillard (2001, 4) notes that conservatives among women (e.g., Phyllis Schlafly) and minorities (e.g., Thomas Sowell and Richard Rodriguez) "have been dismissed as traitors, as self-loathing reactionaries who are little more than dupes of powerful white, male, heterosexual conservatives." Recently, Lee Freed, a female president of the Manitoba chapter of the First Nations Accountability Coalition in Canada, accused the male tribal leadership of corruption and nepotism. Such contemporary controversies over the leadership of historically disadvantaged groups confirm that historically disadvantaged groups can possess different understandings about who should be their representatives. They also confirm the suspicion that simply having descriptive representatives is not sufficient to meet the requirements of a democratic commitment to the concerns of historically disadvantaged groups. Descriptive representation can fail to revitalize democratic institutions. It can also undermine democratic institutions if the ruling elites of historically disadvantaged groups use their institutional positions to control those groups instead of mobilizing those groups or bringing their overlooked interests onto the policy agenda (e.g., Cohen 1999). For these reasons, it is important to clarify the criteria for judging descriptive representatives. Evaluations of democratic institutions need to go beyond merely quantitative considerations—that is, the number of descriptive representatives. Evaluations of democratic institutions need to consider the extent to which preferable descriptive representatives are present. The criteria for identifying preferable descriptive representatives need to identify principled reasons for preferring some descriptive representative to others that are in line with the arguments for group representation. By failing to discuss criteria for assessing descriptive representatives, this theoretical literature ignores certain persistent debates about descriptive representation in contemporary politics. It also disregards the possible dangers and disappointments of a politics of presence to democratic politics.

### THE CRITERION FOR EVALUATING DESCRIPTIVE REPRESENTATIVES

My criterion for evaluating descriptive representatives is a general one: Democratic citizens should consider the degree to which a descriptive representative has mutual relationships with dispossessed subgroups as relevant to identifying preferable descriptive representatives. Preferable descriptive representatives will have strong *mutual* relationships with *dispossessed subgroups*. This criterion is composed of two aspects. First, preferable descriptive representatives should possess a particular kind of relationship (mutual), and second, they should have this kind of relationship *with* certain subgroups of historically disadvantaged groups (dispossessed). I explicate both aspects of my criterion below.

#### Mutual Relationships

The importance of relationships to group identity is not a new claim. David Truman (1951, 24) maintained that "interactions, or relationships, give the group its molding and guiding power." Other theorists of group representation discuss relationships between representatives and their constituents (e.g., Williams 1998, chap. 6; Young 2000, chap. 4). However, these theorists typically examine these relationships primarily in terms of whether the constituents "trust" their representatives. Young (2000, 128–30) evaluates the *process* of representation by the extent to which the relationship between representative and constituents "avoids separation" and "renews connection." She does not address how to evaluate particular individuals engaged in the process of representation.

What is distinctive about my criterion is its specification that representatives and members of historically disadvantaged groups must mutually recognize each other. Mutuality requires an interactive relationship between representatives and citizens. Mutual relationships require a historically disadvantaged group to recognize its descriptive representatives in a particular way as well as a descriptive representative to recognize that group in a particular way. Such reciprocal recognition is necessary for descriptive representatives and their groups to coordinate consciously chosen political activities. Descriptive representatives without mutual relationships could be "representative" in the sense that their behavior responds to the policy preferences of their group, but such responsiveness is not sufficient to make the form of representation democratic. Kings could be representatives of their subjects, in this sense, if they sufficiently polled the preferences of their subjects.

Democratic relations demand effective participation on the part of citizens (Dahl 1989, 109). Democratic representation requires that citizens can access and influence political institutions. Descriptive representatives with mutual relations would improve democratic representation by enabling historically disadvantaged groups to influence the political decision-making process. In doing so, historically disadvantaged groups

act in concert with their descriptive representatives. Democratic relationships are therefore ones "in which both parties are active" (Plotke 1997, 29).

In proposing this criterion, I am advocating a new approach to assessing the performance of descriptive representatives. Political scientists often evaluate descriptive representatives' performance by focusing exclusively on notions of interests as identified by policy preferences. Assessing descriptive representatives solely by the way they cast their votes can lead to the conclusion that it does not matter who represents historically disadvantaged groups (Schwarz and Shaw 1976; Swain 1993). This approach ignores other reasons for having descriptive representatives, e.g., introducing overlooked interests or building trust in the political institutions. Cathy Cohen's analysis (1999) of AIDS activism in the African-American community revealed the general failure of black elites to recognize the particular needs of certain subgroups in the African-American communities, that is, black gays and lesbians and IV drug users. Cohen showed that although black leaders often maintained a "good" voting record in terms of AIDS policies, they failed to transform the nature of the political debate in ways that address the particular interests of specific subgroups in the African-American community, e.g., needle exchange programs.

Good descriptive representatives therefore cannot be identified simply by examining voting records. Just as presidential performance is partially judged by the president's selection of staff, descriptive representatives should be judged by who does and does not interact with them. Assessments of descriptive representatives need to consider whether these representatives reach out to (or distance themselves from) historically disadvantaged groups. Preferable descriptive representatives facilitate social networks. Formal as well as informal ties provide the channels through which democratic relationships could work and thereby the means to revitalize democratic institutions. I introduce mutual relationships into discussions of descriptive representation because these discussions need to reflect the fact that what determines policy is not only what political actors do but also whom they know.

It is important to emphasize a consideration implicit in my claim that preferable descriptive representatives possess mutual relationships: The commitment to democratic representation requires that democratic citizens should not be apathetic. Preferable descriptive representatives will inspire their group to act in concert with them. Although it is possible that a descriptive representative could adequately "represent" the concerns of the apathetic insofar as the representative takes positions that reflect the interests or preferences of apathetic citizens, the descriptive representative's actions would not be democratic to the extent that apathetic citizens do not care about the activities of that representative. My criterion prefers descriptive representatives who can and do mobilize a historically disadvantaged group, encouraging the active engagement of that group. Requiring preferable descriptive representatives to have mutual relations is very demanding and therefore likely to support robust democracies.

To possess mutual relations, descriptive representatives must recognize and be recognized by members of a historically disadvantaged group in two ways. First, they must recognize each other as belonging to a historically disadvantaged group, and second, they must recognize each other as having a common understanding of the proper aims of a descriptive representative of the group. To recognize each other mutually in these two ways is to possess a mutual relationship.

Preferable descriptive representatives are those who recognize and are recognized by members of their historically disadvantaged group as being "one of us." In particular, they have a reciprocated sense of having a fate linked with that of other members of their group. Michael Dawson (1994, 77) defines the notion of linked fate in reference to African Americans as "the degree to which African Americans believe that their own self-interests are linked to the interests of the race." To possess a sense of linked fate is to experience "the group interests... as a useful proxy for self-interest." In other words, individuals who believe that their fates are linked to a group believe that "what happens to the group as a whole affects their own lives."

The notion of linked fate reflects the fact that a person's range of choices—that is, his or her perceived opportunities and goals—is both subjective and social. Group identities are partially formed by "the political processes through which concrete notions of collective interest are shaped,... who participates in those processes and who is advantaged and disadvantaged by them" (Reed 1999, 45-46). Recent political theorists have also endorsed the view that the social worldwhat they call culture—limits the range of choices available to individuals. For example, Joseph Raz and Avishai Margalit (1994, 119) state that "familiarity with a culture determines the boundaries of the imaginable. Sharing in a culture, being part of it, determines the limits of the feasible." In this way, membership is both "something that you are 'born' into and that constitutes you as being who you are and is ascribed to you by others in a way that makes it involuntary from your point of view" (Gould 1996, 182). Thus, even individuals who object to their identities being defined largely in terms of their group membership or who are critical of the ways in which group membership can constrain their choices can still have a sense of sharing their fate with a historically disadvantaged group.

To have a sense of linked fate with a historically disadvantaged group partially entails having a substantive conception of that group that is relevantly similar to those held by other members of that group. Group membership can be based on shared visible characteristics, e.g., color of skin, or on shared experiences (Mansbridge 1999). The substantive content of group membership can vary. Some individuals can belong to more than one group and therefore experience conflicting allegiances to different groups. Members can also possess conflicting views on their group's politics. I am not denying such differences.

<sup>&</sup>lt;sup>13</sup> For a discussion of how to measure this sense of linked fate using attitude and opinion surveys, see Dawson 1994, 77–80, 82–84.

But preferable descriptive representatives for a given group share an understanding of the group's boundaries with that group. Descriptive representatives who possess a narrower (and more exclusive) understanding of those boundaries are unable, or at least less likely, to satisfy the arguments that justify group representation. For this reason, an African-American descriptive representative who denies that gay and lesbian blacks are members of the group (or who excludes conservatives, IV drug users, Muslims, or other religious African Americans) would be less preferable than one who includes those members in his or her understanding of the group. 14 After all, justifications for group representation tend to emphasize the extent to which descriptive representatives include overlooked interests, build trust, and foster deliberation. Descriptive representatives who overlook certain members of the group or who deem certain members "inauthentic" are less likely to fulfill these functions. Representatives who possess broader understandings of the group are more likely to overlap with the varied understandings of the represented and therefore satisfy the reasons for having an institutionalized voice.

Inclusive language also has its pitfalls (e.g., Cohen 1999; Minow 1990; Reed 1999, 17). Generalized notions of a group can be so abstract and all-encompassing that they ignore significant differences among members of the group. Hence, U.S. suffragists who claimed to speak for women were justifiably criticized for speaking from an unreflective bias of being middle-class or educated or white (Davis 1983). Abstract notions of the group can also prevent elites from being held accountable to specific people. Speaking about the "underclass," "women," or "Latinos" in general terms can create an illusory unity among members of those groups that can be used to the detriment of vulnerable members of those groups (Reed 1999, 5). For example, it is possible to diminish community support for policies aimed at helping vulnerable members of a community by portraying those policies as attacks on the community. Preferable descriptive representatives possess shared understandings of group membership that recognize salient differences of subgroups. I elaborate on my understanding of such salient differences in my discussion of dispossessed subgroups below.

To understand the importance of mutual recognition of belonging to the group for evaluating a descriptive representative, consider the following case. It is possible to imagine an African-American representative who grew up in a primarily white neighborhood, attended predominantly white private schools, has a white spouse, and has shown no demonstrable interest in the problems of other African Americans. In fact, such a representative could thrive politically by publicly distancing herself from the African-American community.<sup>15</sup> The point of this example is not to

question whether this woman is an "authentic" African American. I believe that she is. 16 Rather, it is to question whether such a representative could satisfy sufficiently the reasons that theorists for a politics of presence gave for increasing the number of descriptive representatives. After all, such a descriptive representative lacks the relationships necessary to satisfy these reasons. She might individually face certain obstacles and experience forms of discrimination because of her identity; however, she lacks the relationships with African Americans that could enable her to achieve mutual recognition with them. The extent to which she disavows her relationships to African Americans indicates the extent to which she is less likely to possess mutual relationships with them. African-Americans would be more likely to distrust her. She would also be less likely to advance overlooked interests of the African-American community and to mobilize that community. Who perceives that representative as "belonging" to the group and whom a representative claims to act on the behalf of are important considerations for evaluating the qualifications of descriptive representatives.

Individuals in mutual relationships not only recognize each other as belonging to the same group, but also recognize that they share an understanding of the proper aims of their representatives. To have shared aims is to possess a similar vision for the future direction of politics—one whose goal is the improvement of the social, economic, and political status of particular historically disadvantaged groups. My understanding of aims has two components: policy preferences and values.<sup>17</sup> A descriptive representative could disagree with members of a historically disadvantaged group about either component, yet still share aims.<sup>18</sup> Some

a less preferable descriptive representative if those in the African-American community did not accept and identify him as a member of their community. Given the current divisions between racial groups, such a revised understanding of racial identity is possible, albeit unlikely. Note that Young's example is presented in a way that emphasizes its potential to be more inclusionary, while my argument suggests that relationships provide reasons for objecting to certain descriptive representatives for particular groups.

For a discussion of the difference between measuring political values and policy preferences, see Stoker 2001 and Rasiniski 2001.

18 To explicate the idea of an aim, it is necessary to differentiate an aim from what Young (2000, 134) calls the "modes of representation"—that is, three aspects of one's identity that need to be represented. Those three aspects are interests (policy preferences), opinions (values, priorities, and principles), and perspectives (starting points of conversations). While Williams (1998, 171) argues that interests and perspectives are more inextricably tied, Young stresses how these different aspects of a person's identity can conflict.

<sup>&</sup>lt;sup>14</sup> As can be seen, descriptive representatives with mutual relations do not necessarily possess "progressive" or "liberal" policy agendas. <sup>15</sup> My example bears a strong resemblance to Young's example of an Asian American who has an African-American perspective. However, my argument suggests that such an Asian American would be

<sup>&</sup>lt;sup>16</sup> To articulate reasons for preferring some descriptive representatives to others is not the same as questioning the authenticity of a descriptive representative's membership. A full discussion of the relationship between preferability and legitimacy is clearly beyond the scope of this paper. Here I purposely limit my discussion to the desirability of particular descriptive representatives, not their legitimacy. I recognize that all members of a historically disadvantaged group are in some sense legitimate descriptive representatives of that group. In other words, Reverend Jesse Jackson, Marian Wright Edelman, Shelby Steele, and Allan Keyes are all legitimate descriptive representatives for African Americans; however, who is a preferable descriptive representative for African Americans depends on who possesses strong mutual relationships with dispossessed subgroups. Such subgroups can include conservative and/or poor subgroups.

members might experience a descriptive representative advocating certain public policies as a litmus test for shared aims with that representative, e.g., their position on abortion or affirmative action, while others see shared aims as resulting from a particular combination of policy preferences and values. Individuals can and will have different conceptions of what is necessary for having shared aims. Nevertheless, a descriptive representative who did not share either component with a historically disadvantaged group does not share aims with that group.

In this way, my criterion recognizes that people who share similar political values can justifiably disagree about the desirability of certain public policies. It also recognizes that individuals with different political values can agree about certain public policies. Consequently, I do not always want people who agree with my political values or with my policy preferences. I do want someone who shares my aims. The notion of shared aims recognizes the importance of the interaction between policy preferences and values for selecting preferable descriptive representatives. For this reason, shared aims must be measured in degrees: Descriptive representatives share aims with a historically disadvantaged group to greater or less degrees.

This notion of aims as a kind of direction for politics interjects into discussions of group representation my belief that the actions of descriptive representatives do matter. Pitkin was wrong to draw such a firm distinction between what a representative looks like and what a representative does. My criterion for evaluating descriptive representatives offers one way to follow Phillips's recommendation to integrate a politics of presence with a politics of ideas. Descriptive representatives are preferable to the degree that their actions are perceived by members of a historically disadvantaged group as improving their linked fate. My notion of aims is meant to capture the fact that members of historically disadvantaged groups, despite having different policy preferences and values, can still share a political vision aimed at relieving the plight of their communities. Thus, the actions of descriptive representatives are not irrelevant to who should be considered a preferable descriptive representative. Preferable descriptive representatives recognize themselves, and are recognized by members of a historically disadvantaged group, as sharing the aims of that group.

The importance of shared aims is most readily apparent when one lacks a representative who shares one's aims. One is less likely to accept differences of opinions with those who have different aims than with

For Young, the process of democratic representation relies on all three modes.

Young's analysis of the dynamic processes of representation, though, can divert attention from the proper standards for evaluating particular representatives. Individual representatives are less likely to satisfy all of these different modes of representation than are the processes of representation. I know of no representative who shares all of my interests, opinions, and perspectives. These modes of representation are too narrow to provide much guidance for identifying preferable descriptive representatives. For this reason, I argue that members of historically disadvantaged groups should seek descriptive representatives who share their aims.

those who share one's aims. My discussion of shared aims reflects evidence that African Americans tend to give their leaders the benefit of the doubt in the face of controversies, e.g., controversies over Louis Farrakhan. Historically disadvantaged groups are willing to "own" a representative with whom they disagree (Dawson 1994). The reason is that they possess a linked fate and shared aims with these leaders.

Both a sense of belonging to a group and shared aims are important for mutual relations, for individuals whose fates are linked can have different aims. For example, ultraorthodox Jewish women are forbidden from studying general subjects such as math and embrace their traditional role in the house. Moreover, many ultraorthodox women believe that women are incapable of making important decisions (such as voting). For some of these women, it is proper to arrange their social and political lives around the assumption that women are inferior. The presence of these ultraorthodox Jewish women in Israel affects how Israeli women (including Jewish secular or even Palestinian women) are perceived. Nonpracticing Jewish women, Palestinian women, and ultraorthodox Jewish women thus share fates in Israel, even though these different subgroups have contradictory policy preferences and values. This example demonstrates that members of historically disadvantaged groups can share fates, even though their aims differ.

Preferable descriptive representatives are those who possess mutual relationships with their constituents. But, as has been shown, this relationship consists in descriptive representatives and their historically disadvantaged groups recognizing each other as having a linked fate and sharing aims. This mutual recognition thus provides some substantive guidance both for which descriptive representative is preferable and for what a descriptive representative should be doing. In these ways, mutual relationships between a descriptive representative and a historically disadvantaged group provide that group with a stake in politics: They can influence the political agenda through acting in concert with their descriptive representatives.

#### **Dispossessed Subgroups**

I now clarify the second aspect of my criterion—what I mean by a dispossessed subgroup. Dispossessed subgroups should not be understood as those groups that literally do not possess any private property, possessions, or resources. Rather, I use the term dispossessed in a narrower way to refer to groups that are unjustly excluded from and/or stigmatized by the political process and consequently lack the political and economic resources necessary for effective representation. Often dispossessed subgroups suffer oppression not only as members of their overarching group but also as members of the subgroup. They are therefore members of historically disadvantaged groups, yet they face further political obstacles—what Cathy Cohen (1999, 70) describes as secondary marginalization—that is, the ways in which members of marginalized groups construct and police group identity as to regulate behavior,

attitudes, and the public image of those groups. Perhaps it is in virtue of the combination of the forms of oppression that they lack the financial, time, and social resources necessary for political participation. Class, sexuality, drug use, geographic location, relationships to welfare, criminal records, and religion are all possible markers of dispossessed subgroups.

This second aspect of my criterion offers a way to return to the commitment found in the literature on group representation to those groups that have been and continue to be marginalized within the existing political system. A commitment to group representation entails a commitment to those whose interests have been overlooked, who have been and continue to be unjustly excluded from political participation, and whose presence could revitalize democratic institutions. Group representation therefore requires being vigilant about groups that lack a political voice. Preferable descriptive representatives would be those who seek out and establish mutual relationships with dispossessed subgroups.

To demonstrate the importance of mutual relationships with dispossessed subgroups, I focus on the ways in which class inequalities can constrain effective representation.19 Such inequalities can undermine democratic citizens' political resources. My discussion of dispossessed subgroups is by no means limited to the experiences of poor subgroups of historically disadvantaged groups. Other subgroups that lack the political and economic resources for effective representation would also count as dispossessed. I use poor subgroups to illustrate my understanding of dispossessed subgroups for two reasons. First, this example highlights the necessity of mutual relationships for improving the substantive representation of historically disadvantaged groups. Second, this example demonstrates the interactions among different forms of oppression.

Theorists of group representation often implicitly recognize the importance of class in their arguments. Almost all proponents of group representation (e.g., Phillips 1999, 151; Williams 1998, 15–18; Young 2000, 92–99) appeal to the economic structural inequalities that certain marginalized groups face, e.g., the rates of victimization, of poverty, of housing, and of job discrimination, to justify group representation. In this way, they recognize that economic inequalities are one indicator that a group deserves a political voice.

Nevertheless, just as in previous times women and ethnic groups were considered adequately represented by the presence of white male representatives, theorists of self-representation do not adequately acknowledge problems with poor subgroups of historically disadvantaged groups being represented by econom-

ically more privileged members of their group. Some explicitly deny that class should be incorporated into political solutions for presence. For example, Phillips argues that the politics of presence should be treated as distinct from issues concerning class. Phillips offers several reasons for this distinction, e.g., the difficulty in defining class. However, Phillips (1995, 170-78) admits that these reasons for treating class separately are "insincere," stating that "when it comes down to it, the real reason for my silence on class is simply that it does not lend itself to the same kind of solutions."20 This admission implies that considerations of class cannot be adequately incorporated into the types of institutional reforms necessary for increasing the number of descriptive representatives. Interestingly, this admission contradicts her arguments for a politics of presence. Phillips is quite explicit that a politics of presence is not a guarantee for a robust democratic politics. A democratic politics must balance the commitment to presence with another commitment: what Phillips calls "a politics of ideas." For Phillips, the politics of ideas refers to the commitment to particular opinions, preferences, and beliefs. The politics of ideas would include one's position on class issues. In contrast, a politics of presence is a commitment to the intuition that it matters who expresses those opinions, preferences, and beliefs. For Phillips, democratic practices will flourish when democratic citizens start integrating these two commitments. Phillips's claim that class should not be incorporated into a politics of presence violates her own understanding of the conditions necessary for robust democratic relations.

Others minimize the significance of socioeconomic factors by choosing examples that focus almost exclusively on only one form of oppression. Often these examples explore the ways that groups are formally excluded from political participation. For instance, Williams focuses on the structural obstacles faced by U.S. women and African Americans in their efforts to gain full political standing. She cites economic inequalities as indicators that institutional reforms are necessary, yet her proposed institutional reforms are aimed exclusively at formal political exclusions.

Williams's emphasis on formal political exclusions reflects the tendency among proponents of group representation to notice the oppressive nature of socioeconomic status without incorporating this observation into their arguments for group representation or into their proposed institutional reforms. These proponents also have not incorporated the insight that one must understand the interactions among multiple forms of oppression (e.g., Collins 1990; Higginbotham 1992; hooks 2000).<sup>21</sup> One cannot simply "add on" an analysis of class after advocating for increasing the

<sup>&</sup>lt;sup>19</sup> I explicitly reject an understanding of class that is based on categories and classification schemes; rather, I am concerned with how class relations are produced and maintained through political institutions. Phillips argues that the category of class is substantively different from conceptions of race and gender. For example, one loses one's class when one becomes an elected official. For an alternative understanding of class, see Acker (2000, 197), who defines class as "social relations constructed through active practices, not as categories or classifications of people according to socioeconomic characteristics or occupational status."

<sup>&</sup>lt;sup>20</sup> For her full discussion of class, see Phillips 1995, chap. 7.

<sup>&</sup>lt;sup>21</sup> The failure of the literature on descriptive representation to incorporate this insight is readily apparent in its proposed institutional reforms, e.g., party quotas. For instance, these reforms do not specify whether Asian Americans should count as descriptive representatives for African Americans and therefore should count toward an African-American party quota, as Young's example implies. Nor do they provide any way for determining whether African-American

representation of women and people of color. Deborah King illustrates the inability to add on class by noting that education can increase the income potential among different groups disproportionately. King (1993, 223–24) claims that the economic benefits "of a post-secondary education, a college degree or higher, are greater for black females than for white females while among those with less than a college degree, black females earn less than white females." In this way, King reveals that focusing too much on only one form of oppression can mask the obstacles faced by certain segments of historically disadvantaged groups.

Williams's analysis of self-representation would have benefited from an example in which the dynamic of multiple forms of oppression was considered. For instance, Margaret Wilkerson and Jewell Gresham (1993, 297) have argued that the "feminization of poverty" cannot be understood as distinct from the "racialization of poverty." Wilkerson and Gresham claim that the focus on the economic inequalities faced by women "negates the role played by racial barriers to black employment, particularly among males." Theorists of group representation tend to give examples in which the dynamics of race, class, and gender are prominent only a cursory treatment, if any treatment at all. They also tend to downplay how political norms and practices within the democratic institutions, e.g., recruitment practices, can marginalize certain subgroups. Consequently, their understandings of group representation ignore that inclusion in politics can promote instrumental political bargaining at the expense of transformative politics (Dryzek 1996; Reed 1999).

More specifically, theorists of group representation do not adequately address the particular barriers to effective representation experienced by poor subgroups of historically disadvantaged groups. For instance, given the practice of disenfranchising convicts, the high incarceration rates of poor blacks and Latinos cut off traditional avenues for seeking political representation:

Every state but three imposes some type of ban on voting by those convicted of serious crimes. Most states bar voting by felons while in prison, but restore the right to vote once the individual has served his sentence or completed parole. In 14 states, a felony conviction can mean a permanent ban on voting. (Braceras 2000)

The current practice of disenfranchising convicts cast doubts on whether certain subgroups of historically disadvantaged groups should rely primarily on electoral procedures for achieving substantive representation. Theorists of group representation need to address the obstacles that are produced through the interactions among different forms of oppression and that unjustly constrain certain subgroups.

Theorists who emphasize electoral reforms that increase the number of descriptive representatives also

women should "count" under the number of all women or have their own quota in the party lists. The failure to address these issues in this literature reveals the failure to incorporate an interactive understanding of race, class, and gender. tend to ignore the kinds of resources necessary for poor subgroups to advance their political agendas. Traditional means for getting policy preferences onto the political agenda—studies, public relations campaigns, lobbying efforts—advantage citizens who are financially better off and resource-rich. Being able to stay informed about political issues, let alone to participate in politics, requires time and economic resources. Elected officials increasingly spend their time fund-raising. Citizens with economic resources can buy access, but those without economic resources tend to have relatively less access. Consequently, those with economic resources do not necessarily need as much of an institutionalized voice as those who lack those resources.

Typically, citizens who lack economic resources need to register their preferences through non-institutional and confrontational tactics. Frances Fox Piven and Richard Cloward (1979, 3) have argued that "protest tactics which defied political norms were not simply the recourse of troublemakers and fools. For the poor, they were the only recourse." According to Piven and Cloward, poor citizens need alternative tactics, such as protests, for effective representation. These tactics depend on numbers and relationships. Piven and Cloward's position reflects the common belief in the literature on social movements that more disruptive tactics are more likely to be successful (e.g., McAdam 1983; Tarrow 1994; Tilly, Tilly, and Tilly 1975). The social networks surrounding descriptive representatives are therefore relevant to their preferability. A descriptive representative who possesses mutual relationships to poor subgroups of historically disadvantaged groups is more likely to have the political resources necessary for advancing those subgroups' interests. Such descriptive representatives also hold the promise of expanding the boundaries of political participation.

One should not assume that class "perspectives" are necessarily better represented if ethnicity, race, and gender are better represented in legislatures. After all, research has documented the economic disparities within various racial groups (e.g., Dawson 1994, chap. 2; Hochschild 1995; Wilson 1980). Such disparities are increasing. Although they continue as a group to be economically and socially worse off than whites, African Americans are increasingly economically divided in ways that affect housing, jobs, death rates, and the likelihood of being a victim of crime. Such disparities among African Americans have led some to conclude that black identity will increasingly be tied to considerations of class as opposed to race—what Kilson (1983) called "status deracialization" and Wilson (1980) titled "the declining significance of race."

For Dawson (1994), the economic polarization of blacks does not necessarily lead to political polarization. Economic polarization, though, does affect the extent to which poor blacks participate politically. After examining falling rates of political participation among poor blacks, Hochschild (1995, 50) concluded that "the worst-off in general are losing political influence, and the worst-off blacks in particular are losing most." This observation is especially troublesome when considered in conjunction with Cohen's (1997)

claim that historically disadvantaged groups are policed internally. If Cohen is correct, then the choice of descriptive representatives is crucial for understanding why some dispossessed subgroups lack substantive representation. This choice is also crucial for the proposed institutional reforms, e.g., party list quotas and proportional representation, to be able to revitalize democratic practices.

Of course, low economic status is not the only reason that citizens do not participate in politics. Cohen (1999, 346) revealed that black gays and lesbians who were HIV-positive did not participate in AIDS protests from fear of being seen by other members of the black community. Such fears were particularly acute for members who relied on that community for support while sick. As Cohen's example demonstrates, other political norms and practices besides the formal exclusion of historically disadvantaged groups can exclude certain subgroups of historically disadvantaged groups. For this reason, preferable descriptive representatives can have mutual relationships with other types of dispossessed subgroups.

My criterion for evaluating descriptive representation should not be interpreted as arguing that the selfrepresentation of women or of African Americans or other minorities is secondary to the representation of the poor. Such an argument would merely mimic the common claim that identity politics is divisive while class is more unifying (Gitlin 1995). Nor am I repeating claims that class is more politically salient than race (e.g., Loury 1987; Murray 1984; Sowell 1984). Instead, I maintain that who is a preferable descriptive representative depends on how different forms of oppression intersect, for example, how race can work in conjunction with class is relevant to determining who is a preferable descriptive representative. Democratic citizens need to evaluate descriptive representatives in ways that attend to how political institutions marginalize certain groups. Young was right that institutional reforms aimed at increasing the number of descriptive representatives can entrench certain interests, e.g., by privileging heterosexual Latinos at the expense of gay and lesbian Latinos. Moreover, evaluations of descriptive representatives are particularly messy when segments of a historically disadvantaged group reject a descriptive representative. For Young, the diversity within historically disadvantaged groups can be so great that schemes of group representation will necessarily result in the suppression of difference.

However, recognition of the diversity within historically disadvantaged groups does not change the fact that some groups are chronically underrepresented. In other words, it does not change the fact that some groups need institutional reforms to enhance their substantive representation. For the institutional reforms to work successfully, democratic citizens need to select descriptive representatives in ways that are sensitive to how institutional norms and practices unjustly marginalize dispossessed subgroups. My criterion offers one way to take into account the dynamic among different forms of oppression: Who is a preferable descriptive representative depends partially on

whose interests, opinions, and perspectives are being excluded. Recall that a descriptive representative's shared aims and sense of belonging to a group provide some substantive guidance for what that representative should be doing. In this way, my criterion depends on context. Those selecting descriptive representatives (for appointments, committees, or public office) need to attend to the mutual relationships that descriptive representatives possess with dispossessed subgroups. They should not assume that "just any woman will do" or that "just any black will do." Institutional reforms aimed at increasing the number of descriptive representatives are more likely to revitalize democratic institutions if citizens assess descriptive representatives using my criterion.

For this reason, I submit that when one has a choice between two descriptive representatives, one who has strong mutual relationships to dispossessed subgroups and another who does not, one should (ceteris paribus) prefer the former. I have so far avoided the question of what to do when choosing among descriptive representatives who possess mutual relationships to different dispossessed subgroups. Such moments do not have generalizable or easy answers. In such circumstances, citizens face tough choices that require exercising their own political judgment. To recognize that the dispossessed too can have diverse interests is to acknowledge that my criterion might not settle the question of who is a preferable descriptive representative. However, the refusal to examine the criteria being used for selecting descriptive representatives can reinforce the norms and practices that unjustly exclude dispossessed subgroups. Public deliberations about the proper criteria could therefore help refine those decisions and prevent such exclusions.

If historically disadvantaged groups do possess such deep divisions that they must consistently choose among interests, opinions, and perspectives of competing dispossessed subgroups, then those groups are less likely to be legitimately represented by only one representative. In other words, if certain groups possess intractable divisions, e.g., between liberal and conservative African Americans or between heterosexual and gay and lesbian Latinos, then such groups would need more than one descriptive representative. This observation affirms Young's conclusions (1999) about the need to pluralize group representation. The presence of multiple dispossessed subgroups indicates the need for more descriptive representation, not less. Unfortunately, there is often a limit to how many descriptive representatives a given group can have. 22 Such limits require principled criteria for selecting descriptive representatives. As we have seen, the refusal to articulate any criteria for preferring some descriptive representatives to others has led some theorists, such as Young, to weaken their commitment to the position that historically disadvantaged groups should be represented by

<sup>&</sup>lt;sup>22</sup> This argument could lead to the proliferation of descriptive representatives. For a helpful discussion on how to identify historically disadvantaged groups, and thereby subgroups, that deserve group representation, see Williams 1998, 15–18.

members of their group. As I have also pointed out, this refusal could also prevent the proposed institutional reforms from revitalizing democratic institutions: Some descriptive representatives may perpetuate or even aggravate the marginalization of historically disadvantaged groups.

Proponents of group representation are likely to agree that it is important to attend to the relationships between descriptive representatives and dispossessed subgroups. In fact, my criterion arises from the same normative commitments that justify group representation. According to this logic, the extent to which a politics of presence can include those who have been systemically excluded from political life is also the extent to which a politics of presence can bolster democratic participation and the legitimacy of democratic institutions.

However, one needs to understand that democratic representation excludes as well as it includes. The act of excluding is not in itself objectionable on democratic grounds. After all, representative institutions require selecting some representatives at the expense of others. I introduce my criterion in an effort to provide some guidance for preferring certain descriptive representatives to others. I hope that others will expand on my criterion in ways that are sensitive to the reasons for supporting group representation and to data on the political marginalization of different groups. Introducing a criterion such as mine into existing discussions of group representation offers a principled way to balance a commitment to the diversity within historically disadvantaged groups with a commitment to group representation.

# **Ameliorating Majority Decisiveness through Expression of Preference Intensity**

EYAL BAHARAD University of Haifa SHMUEL NITZAN Bar Ilan University

In pairwise voting, when a simple majority rule produces a winner, that winner is robust to the minority's preferences. The typical means of protecting the minority from the decisiveness of the majority is by increasing the required majority or by augmenting the simple majority rule with constitutional constraints. In the former case the required majority q becomes larger than one-half, and this implies that the q-majority rule becomes biased in favor of one of the alternatives, usually the status quo. In the latter case the augmented rule becomes biased in favor of the minority. The main issue examined in this paper is whether the amelioration of majority decisiveness can be attained by unbiased voting rules that allow some restricted expression of preference intensities. Our results clarify that the use of scoring rules provides a positive answer to the above question when voters resort to variable degrees of coordinated strategic voting. The results are illustrated in the special cases of the plurality and the Borda rules.

n elections where the outcome is determined by a pairwise simple majority rule, a Condorcet (1785) winner need not exist. In other words, the simple majority rule is often unstable, and therefore, in general, this rule is not a well-defined voting rule (Austen-Smith and Banks 1999). Another weakness of the simple majority rule is that whenever the majority happens to share the same view regarding the best candidate, the majority consensus candidate is always selected, regardless of the minority preferences and, in particular, intensity of preferences (Sen 1970). This second problem of majority decisiveness, namely, the universal robustness of the selection of the majority consensus to the intensity of the minority preferences, can be resolved by increasing the required simple majority to a special or supramajority q, q > 1/2, or by augmenting the simple majority rule with constitutional constraints that protect the minority. In the former case the resulting q-majority rule is biased in favor of one of the alternatives, usually the status quo. As established by Greenberg (1979), a sufficient increase in  $q, q \ge (k-1)/k$ , also resolves the instability problem. In the latter case the resulting rule becomes biased in favor of the minority. The main objective of this paper is to show that the amelioration of the simple-majority decisiveness can be attained by unbiased voting rules that allow some restricted expression of preference intensities, viz., by scoring rules. As is well known, these rules are also not vulnerable to the first stability problem, that is, they are well-defined voting rules.

The notion of majority decisiveness is related to the classical notion of majority tyranny, which has drawn a lot of attention, especially since the second half of the eighteenth century. The *locus classicus* is the *Federalist* No. 10 (Madison 1787) and the Madisonian arguments

group pursuing goals contrary to the rights of others or to "the permanent and aggregate interests of the community." For John Stuart Mill, a tyrannical majority violates someone's liberty to do as pleased when not harming others. Tyranny of a majority is thus characterized by two basic elements: (i) factionalism, that is, effective implementation of goals pursued by a specific majority group; and (ii) "unjustness" of at least one favored alternative x imposed by that majority group. Using modern terminology, tyranny of a particular majority group T means that the set of groups that are decisive with respect to those undesirable alternatives consists of T and all the groups that contain it. The point of departure of this study is the different notion of decisiveness of the majority, any majority, which is an important property of preference aggregation rules or of voting rules that has been extensively studied by social choice theorists (Arrow 1963; Sen 1970). In the context of voting theory, majority decisiveness is defined as the ability of any majority group to impose its will whenever its members share a common view regarding the desirable collective decision.1

elaborated by Dahl (1956). For Madison, tyranny of the

majority was an instance of factionalism—of a majority

Although majority decisiveness and tyranny of the majority are different notions and one does not imply the other, they share a common problematic aspect, namely, their existence entails a large set of losers (the members of the permanent minority group or the members of any minority group) likely to be deeply alienated from the political system. Majority decisiveness is nevertheless a weaker, a less menacing, and, perhaps, even an acceptable property of voting rules relative to the tyranny of the majority for two reasons. First, the incidence of effective concentration of decision-making power implied by majority decisiveness is not restricted to a specific permanent majority group, so it does not imply factionalism. Second, the incidence of majority

<sup>&</sup>lt;sup>1</sup> This ability depends on whether the majority-coalition members resort to sincere or to coordinated strategic voting.

decisiveness is not restricted to "unjust" alternatives, so it is not necessarily bad or undesirable.

In the context of voting systems, the attempts to resolve the problem of a specific tyrant majority and the lesser problem of majority decisiveness have been based on the application of biased voting rules that do not allow the expression of preference intensities. Such biased rules discriminate in favor of voters, the members of the minority group, and/or alternatives, the "just" ones.<sup>2</sup> By definition, unbiasedness toward voters, the anomymity condition, ensures that tyranny of a (specific) majority does not exist. However, it does not necessarily rule out decisiveness of any majority. As already noted, the main objective of this paper is to examine whether the amelioration of majority decisiveness can be attained by applying unbiased (anonymous and neutral) voting rules that allow expression of preference intensities.<sup>3</sup> Our results clarify how the use of scoring rules can provide a positive answer to the above question. Surprisingly, the role of expression of preference intensities through unbiased rules, in particular, of scoring rules as a means of preventing majority decisiveness, is hardly discussed either in the vast literature on the issue of majority tyranny or in the more formal (social choice) literature on scoring rules. Filling this gap, our main novel contribution is the clarification of the effectivity of scoring rules in alleviating the problem of majority decisiveness.4

Scoring rules can be defined in terms of fixed or flexible scores. Under a flexible unconstrained scoring rule voters are assigned an equal number of scores and no constraint is imposed on the allocation of the initial endowment of the scores among the alternatives. One may think that a flexible scoring rule that enables perfect expression of preference intensities better serves the purpose of avoiding decisiveness of the majority relative to any scoring rule based on fixed scores. Our

results imply that this expectation is unfounded. The problem of majority decisiveness can be resolved only by scoring rules that allow a limited common degree of expression of preference intensities.

We present a general definition of majority decisiveness that allows variable degrees of coordinated strategic voting. The two extreme cases of zero and an unlimited degree of such coordinated strategic voting that are encountered in discussions on majority decisiveness can be viewed as the two canonical special cases. Suppose that the severity of the problem of majority decisiveness is directly related to the size of the dominated minority and is inversely related to the difficulty for the majority to coordinate its strategic voting. Then the severity of the problem of majority decisiveness of size  $\alpha$  resorting to coordinated strategic voting of degree d decreases with an increase in  $\alpha$  and apparently with an increase in d, if such an increase implies a harder coordination task.

Our first result clarifies to what extent a given scoring rule alleviates the problem of majority decisiveness when voters sincerely reveal their preferences. The second and main general result clarifies the effectivity of a given scoring rule in resolving the problem of majority decisiveness when voters resort to strategic voting. Assuming that voters do not take advantage of strategic voting or that they fully take advantage of such voting, the results are illustrated in the special cases of the well-known plurality and Borda rules. The main result is also used to identify the scoring rules that prevent all possible degrees of majority decisiveness under unconstrained coordinated strategic voting. It turns out that scoring rules can eliminate all possible decisive majorities.

In the next section we introduce our setting and the two assumptions of voting rules unbiasedness. The notion of majority decisiveness is then presented, followed by the results and their implications. Concluding remarks are contained in the last section. Formal definitions and proofs appear in the Appendix.

 $^2$  Biased voting rules violate the two standard symmetry properties of voting rules, namely, neutrality and anonymity.  $^3$  Recently, Saari and Sieberg (2001) explain why it can be quite likely

that a majority loses over most of the issues in a different setting of pairwise voting

#### **ASSUMPTIONS AND SETTING**

Let  $N = \{1, ..., n\}$ ,  $n \ge 3$ , denote a finite set of voters and A a finite set consisting of k distinct alternatives,  $k \ge 3$ . Individual preference relations are defined over A and are assumed to be strict (indifference is not allowed). In this study we focus on unbiased voting rules that are usually referred to as scoring rules. A voting rule specifies for any given preference profile a nonempty set of alternatives in A. Unbiasedness has two aspects: unbiasedness toward voters and unbiasedness toward alternatives. Unbiasedness toward voters (anonymity) requires invariance of the voting rule with respect to permutations of voters' preferences; if the preference relations of the voters are permuted, then

of pairwise voting.

There are two main classes of studies of scoring rules and, in particular, of the Borda (1781) rule. On the one hand, there are those studies that seek to expose the weakness of these rules. The most notable disadvantages of scoring rules are their demanding informational requirements, their susceptibility to manipulation (Nitzan 1985; Smith 1999), and their vulnerability to some disturbing anomalies, the socalled voting paradoxes (Brams 1976; Fishburn 1974; Nurmi 1999; Saari 1989, 2000). On the other hand, there are those studies that can be conceived as proponents of scoring rules. These studies emphasize five types of advantages of scoring rules: first, their stability advantages, viz., their success in securing voting equilibria and, thus, ensuring political stability (Moulin 1988; Mueller 2003; Saari 1995; Sen 1970); second, their axiomatic advantages, namely, their uniqueness in satisfying alternative sets of desirable properties of social choice functions (there are more than 40 axiomatizations of scoring rules [see Chebotarev and Shamis 1998 and references therein]); third, their success in selecting an alternative that is the closest to being unanimously preferred according to some reasonable metric between preference profiles (Lerer and Nitzan 1985); fourth, their important advantage of allowing expression of intensity of preferences, in marked contrast to the commonly used majoritarian rules; and, finally, their success in implementing proportional representation (Chamberlin and Courant 1983).

<sup>&</sup>lt;sup>5</sup> In the literature scoring rules are sometimes referred to as positional rules (Gardenfors 1973) or as point-voting schemes (Mueller 2003; Nitzan 1985).

the outcome of the voting rule is not affected. Unbiasedness toward alternatives (minimal neutrality)<sup>6</sup> requires appropriate variance of the voting rule with respect to permutations of the alternatives in A; if the alternatives are permuted in the preferences of the voters on A, then the alternative(s) selected by the voting rule changes accordingly. This property ensures that the labeling of the alternatives is immaterial, all that matters is the voters' preferences.

**Definition.** Let  $\{S_1, S_2, \ldots, S_k\}$  be a monotone sequence of real numbers,  $S_1 \leq S_2 \leq \cdots \leq S_k$  and  $S_1 < S_k$ . Each of the *n* voters ranks the candidates, assigning  $S_1$  points to the one ranked last,  $S_2$  points to the one ranked next to the last, and so on. Under a *scoring rule* a candidate with a maximal total score is elected. If the sequence  $\{S_1, S_2, \ldots, S_k\}$  is strictly monotone, that is,  $S_1 < S_2 < \cdots < S_k$ , the scoring rule is called a *strict scoring rule*.

Scoring rules allow intrapersonal preference intensity because scores are assigned to the alternatives according to their ranking. The intensity of preferring one alternative to another one can be represented by the difference in their scores. Scoring rules also allow a special restricted form of interpersonal preference comparisons because under these rules preference intensities of all voters are implicitly assumed to be comparable and identical, as long as the relative rankings of the compared alternatives are identical. The most common scoring rules are the plurality and the Borda rules.

**Definition.** The plurality rule is a scoring rule where  $\{S_1, S_2, \ldots, S_k\} = \{0, 0, \ldots, 1\}$ . Hence, the candidate who is ranked first by the largest number of voters is elected. The plurality rule is the most commonly used scoring rule.

**Definition.** The *Borda rule* is a strict scoring rule where  $\{S_1, S_2, ..., S_{k-1}, S_k\} = \{0, 1, ..., k-2, k-1\}.$ 

<sup>6</sup> The definition of neutrality follows that of Moulin (1988, 233).

For an axiomatic characterization of the plurality rule, see Richelson 1978.

Under the Borda rule each voter reports his preferences by ranking the k candidates from top to bottom (ties are not allowed), assigning no points to the candidate being ranked last, one point to the one being ranked next to the last, and so on, up to k-1 points to the most preferred candidate. A candidate with the highest total score, called a Borda winner, is elected.

The Borda rule is the most well-known strict scoring rule. <sup>10</sup> Notice that under this rule the preference intensities of all individuals are comparable and equal as long as the difference between the relative rankings of the compared alternatives in the voters' preference ordering is the same (the relative rankings of the compared alternatives need not be identical).

#### **DECISIVENESS OF THE MAJORITY**

When the size of a decisive majority group is T, |T| = $\alpha n$ , we say that there exists an  $\alpha$ -majority decisiveness,  $1/2 < \alpha < 1$ . Henceforth  $\alpha$  is assumed to be a fraction with denominator n. As noted in the introduction, the severity of the decisiveness problem depends on the size of the majority, namely, on  $\alpha$ , as well as on the extent of strategic voting manipulations performed by the members of the majority coalition. Ceteris paribus, the severity of the problem decreases with an increase in the majority size. A decisiveness of 90% of the voters is less of a problem than a decisiveness of 55%. 11 A less obvious characteristic of majority decisiveness is the degree of coordinated strategic voting exercised by the members of the majority coalition. In the nonstrategic voting theory voters are assumed sincerely to reveal their (true) preferences. That is, voting manipulations of any sort are ruled out. However, in the more recent strategic-voting theory, typically, any conceivable preference manipulation is allowed, which clearly facilitates the attainment of decisiveness. The existence of a decisive majority in the former case of nonstrategic voting is more menacing and severe than the existence of a decisive majority in the latter case of unconstrained strategic voting, which hinges on more demanding requirements (stricter informational requirements and possibly a higher degree of coordination among the majority-coalition members).

In the current study we allow the above two extreme degrees of manipulation (i.e., sincere voting and unconstrained coordinated strategic voting) as well as intermediate degrees of strategic voting that may characterize the political-economic environment. These degrees represent an essential characteristic of the political culture of the voters, reflecting, for example, the limit to the voters' self restraint in trying to enhance their interest. The degree of strategic voting d is the maximal deviation between the ranking of any

<sup>&</sup>lt;sup>7</sup> The fact that scoring rules use information on preference intensity and not just information on the voters' ordinal preferences implies that they do not satisfy the independence of irrelevant alternatives (IIA) property. Arrow's (1963) IIA condition is stated as a property of an aggregation function that transforms a preference profile to a social preference relation. This condition is naturally adapted to our context, where the aggregation function is a voting rule that transforms a preference profile to a subset of alternatives; see, for example, Austen-Smith and Banks 1999.

<sup>\*\*</sup>Remarks a process of the promise of a discourse of the state of the

<sup>&</sup>lt;sup>10</sup> For axiomatic characterizations of the Borda rule, see Nitzan and Rubinstein 1981, Saari 1990, and Young 1974.

<sup>&</sup>lt;sup>11</sup> Certainly the problem does not exist when  $\alpha = 1$ . When  $\alpha = (n-1)/n$  the problem is minimal. In fact, in such a case "decisiveness" might be considered desirable and it might be referred to as "minimal democracy" (Austen-Smith and Banks 1999).

alternative in the true and reported preferences of the voters.

**Example 1.** Suppose that individual i's true and reported preferences on the five alternatives a, b, c, e, and f are as in Table 1. The fourth column specifies the deviation in the ranking of the reported alternative. The maximal deviation is obtained for alternative f. In the reported preferences this alternative is ranked second, while according to the true preferences it is ranked fifth. Hence, in this example of a single voter the degree of strategic voting is three.

The degree of strategic voting exercised by the members of the majority coalition can be represented by d. In the literature the two commonly assumed values of d are the extreme values 0 and k-2. When d=0, the voters report their true preferences. When d=k-2, strategic voting is unconstrained. The case d=k-1 is disregarded because the definition of decisiveness is based on majority consent regarding the most preferred (top-ranked) alternative. In such a case manipulation is performed over the remaining k-1 alternatives, which implies that the degree of strategic voting does not exceed k-2.

In this study the voting rules are assumed to satisfy the unbiasedness requirements, namely, anonymity and neutrality. Unbiasedness toward voters implies that if there is an  $\alpha$ -majority decisiveness of some specific group, then there is an  $\alpha$ -majority decisiveness of any group of size  $\alpha$ . That is, due to the anonymity property, decisiveness is contagious: The incidence of effective concentration of decision-making power is not restricted to a specific majority group. In other words, permanent factionalism is impossible. This already rules out the classical tyranny of a specific permanent majority. Unbiasedness toward alternatives implies that if there exists an  $\alpha$ -majority decisiveness of some group that can impose a particular ("unjust") alternative, then it can impose the selection of any alternative. That is, due to the neutrality property, decisiveness is contagious in another sense: The incidence of the effectivity of the decisive majority coalition is not restricted to a specific alternative or subset of alternatives but is unlimited.

By definition, then, under anonymous and neutral voting rules the classical tyranny of the majority is impossible. However, the lesser problem of majority decisiveness may still exist. Such decisiveness means that *every* majority group resorting to sincere or coordinated strategic voting can *always* impose its will (its most desired alternative). That is, it can ensure the

selection of the majority consensus under any preference profile. <sup>12</sup> In general, elimination of the classical tyranny of the majority and amelioration of majority decisiveness are two different issues. In our setting, however, where the voting rules are unbiased toward voters and toward alternatives, the only relevant issue is the amelioration of majority decisiveness.

By definition, a decisive coalition T resorting to a degree of manipulation d can impose its will without having any knowledge of the preferences or the votes of the individuals outside T. This means that whenever T has a consensus candidate its members can adopt contingency-free voting strategies that ensure the selection of the consensus candidate regardless of the voting strategies adopted by the members of the remaining minority. Whether or not majority decisiveness exists depends on the voting rule V applied by the voters. If there exists a decisive majority of size  $\alpha$ , we say that the voting rule V is vulnerable to an  $\alpha$ -majority decisiveness.

The following example illustrates the possible existence of majority decisiveness under the unbiased Borda rule.

**Example 2.** Suppose that there are three voters whose true preference relations over the four alternatives a, b, c, and e are presented in Table 2. In this case, alternative b is selected by the Borda rule because it receives the largest number of points (seven), where alternative a, which is preferred by a majority of 66%, receives only six points. However, voters 1 and 2 can guarantee the selection of alternative a, even without knowing voter 3's preferences. Suppose that voters 1 and 2 report the preferences presented in Table 3. In this case, independent of voter 3's preferences, the selection of alternative a is guaranteed, since it already receives six points from voters 1 and 2, where every other alternative receives only two points. The maximal score that can be assigned by voter 3 to any of these alternatives is three points, which cannot change the sure selection of alternative a. Notice that in this example the majority group consisting of voter 1 and voter 2 delivering a d-message (d = 2) is decisive. Since similar examples can be constructed for majority coalitions that consist of voters 1 and 3 or of voters 2 and 3, there exists a two-thirds-majority decisiveness.

Resolution of the problem of majority decisiveness requires that such decisiveness does not exist. In our setting the problem is therefore resolved if there exists no coalition T,  $|T| = \alpha n$ ,  $1 > \alpha > 1/2$ , which is d-decisive,  $0 \le d \le k - 2$ .

The following three notable attempts have been made to resolve the problem of majority tyranny. Unlike this study, these attempts resort to biased voting rules that are not neutral or not anonymous. The first attempt is based on the application of special-majority

<sup>&</sup>lt;sup>12</sup> Usually (Arrow 1963; Sen 1970), a coalition is called decisive if it can always impose the common preference relation of its members on the social preference relation. Here we define majority decisiveness in terms of the ability of the majority-group members to impose the selection of their common most preferred alternative.

rules.<sup>13</sup> Such rules are anonymous, that is, the alternatives chosen by these rules are insensitive to permutations of the voters' preferences. Hence, if tyranny of some T-majority coalition is avoided, then tyranny of any S-majority coalition of equal size, |T| = |S|, is also avoided. However, these rules are not neutral. As noted above, control over  $\alpha$ , viz., an increase in the required special majority, directly reduces the severity of the tyrant majority problem but does not eliminate tyranny.<sup>14,15</sup>

The second attempt is based on the relaxation of the anonymity property to guarantee respect for the preferences of some predetermined subsets of society, namely, the preferences of some minority groups. The protection of rights of some minority groups is typically secured by constitutional means. The issue of majority tyranny often comes up in the context of the debate about simple majoritarian concepts of democracy versus concepts of liberal democracy that focus on the protection of minority rights (Dahl 1956; Riker 1982).

The third attempt is based on the incorporation of an anonymous veto function into the voting rule. Such a veto function allows every individual, or some coalitions of individuals, to veto one or more alternatives, where the larger the coalition is, the higher the number of alternatives the coalition may veto. The function leaves at least one alternative that is not vetoed by anyone.

Respect for the minority principle requires that every coalition (and, in particular, small ones) has some minimal effect on the voters' selected alternatives. Note that while the first two attempts give up respect for

the minority principle, the third one does respect this principle.

The main claim of this study is that there exists an alternative effective means of alleviating the problem of majority decisiveness. Allowing any degree of strategic voting, our proposed protection of minority rights is based on the use of the well-known family of anonymous and neutral voting rules, namely, the scoring rules. This alternative resolution of the problem differs from the existing solutions. First, by definition, the use of scoring rules does not imply the requirement for a special majority. Second, scoring rules do satisfy the anonymity and neutrality properties. And, third, scoring rules do not imply the existence of any veto function.

#### RESULTS

In this section we examine the effectivity of scoring rules as a means of resolving the problem of majority decisiveness, first under sincere voting, d=0, and then under coordinated strategic voting,  $0 < d \le k-2$ . The implications of the results are derived for the two extreme cases of sincere voting and unconstrained coordinated strategic voting, focusing on the two most commonly used scoring rules: the plurality and the Borda rules. For a given number of alternatives k, the following result characterizes the values of  $\alpha$  for which a particular scoring rule is not vulnerable to an  $\alpha$ -majority decisiveness.

**Theorem 1.** Under sincere voting, d = 0, a scoring rule is immune to an  $\alpha$ -majority decisiveness,  $1/2 < \alpha < 1$ , if and only if

$$\alpha(S_k - S_{k-1}) < (1 - \alpha)(S_k - S_1).$$
 (1)

<sup>&</sup>lt;sup>16</sup> In a binary decision context, the requirement for a special majority is usually justified when there exists asymmetry in the payoffs of the two possible alternatives. The use of such a rule makes the barrier to change from a status quo alternative commensurate with the significance (payoff implications) of the change. The use of such rules may, however, entail a significant cost because it may stultify any choice other than the status quo, thus greatly limiting the ability of the group to act.

 $<sup>^{13}</sup>$  Such rules are sometimes referred to as supramajority or qualified-majority rules.

<sup>&</sup>lt;sup>14</sup> Notice that the severity of the problem of majority decisiveness can sometimes be indirectly reduced by control of d, viz., by reducing the exercised degree of manipulation.

<sup>&</sup>lt;sup>15</sup> Instability of supramajority rules also reduces the problematics of majority tyranny. According to this interesting observation (Miller 1983), "The pluralist political process leads to unstable political choice and such instability of choice in fact fosters the stability of pluralist political systems."

**Proof.** See the Appendix.

The proof of this theorem is based on the following idea: First, identify the most unfavorable circumstances (preference profile) for the majority and, then, derive the condition that ensures that, even in those circumstances, the  $\alpha$ - majority can impose its will. This condition certainly ensures that in any other more favorable situation the majority is capable of imposing its will. Hence, if this condition is not satisfied, the scoring rule is immune to an  $\alpha$ -majority decisiveness. The most unfavorable preference profile for the majority has the following two characteristics. First, the members of the majority coalition share the same view regarding the first and second most preferred alternatives. Second, the most preferred alternative for the majority is the worst for the minority members and the second-best alternative for the majority is the best alternative for the minority members. The idea of the proof is illustrated in the following example.

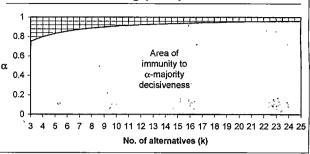

**Example 3.** Suppose that the voting rule is the Borda rule and that there are four voters and five alternatives. In this case,  $S_k - S_{k-1} = 1$  and  $S_k - S_1 = 4$ . By substituting these values in inequality (1), we obtain that under sincere voting, when n=4 and k=5, the Borda rule is immune to an  $\alpha$ -majority decisiveness if and only if  $\alpha < 4(1-\alpha)$ , from which we obtain that  $\alpha < 0.8$ . In this case, then, even a majority of three of the four individuals is not tyrant. A typical most unfavorable profile for the three-member majority coalition consisting of individuals 1, 2, and 3 is presented below; a and b are the first and second-best alternatives of the majority group, and voter 4's best and worst alternatives are, respectively, b and a. The preferences of the four individuals over the five-alternative set  $\{a, b, c, e, f\}$  are presented in Table 4.

TABLE 4. Example 3			
	Preferences of	Voter 4's	
Rank	Voters 1–3	Preferences	Borda's Rank
1st	а	b	b (13 points)
2nd	b	С	a (12 points)
3rd	c	e	c (9 points)
4th	e	f	e (5 points)
5th_	f	a	f (1 point)

In this most unfavorable unfortunate case for the majority, the majority coalition cannot impose its will (alternative a) and alternative b is selected, because the difference between the total points given by the majority to alternatives a and b does not exceed the largest possible difference in the points assigned to these two alternatives by the minority group member, voter 4. Figure 1 presents the combinations of  $\alpha$  and k resulting in immunity of the Borda rule to an  $\alpha$ -majority decisiveness, under sincere voting.

By definition, the problem of majority decisiveness is resolved if the scoring rule is immune to decisiveness of any  $\alpha$ - majority,  $1/2 < \alpha < 1$ . In such a case the rule must therefore be immune to majority decisiveness for  $\alpha = (n-1)/n$ . Immunity to majority decisiveness im-

FIGURE 1. Vulnerability of the Borda Rule to an  $\alpha$ -Majority Decisiveness for k Alternatives Under Sincere Voting (d = 0)

plies not that every voter is a vetoer, but that every voter has a veto power under at least one preference profile. Theorem 1 has the following direct consequences. Under sincere voting, d=0:

(i) A scoring rule is immune to majority decisiveness if and only if

$$(n-1)(S_k - S_{k-1}) < (S_k - S_1).$$
 (2)

This is directly verified by substituting  $\alpha = (n-1)/n$  into inequality (1).

- (ii) Under the plurality rule, where  $S_k = 1$  and  $S_{k-1} = S_1 = 0$ , inequality (2) reduces to n 1 < 1, which can never be satisfied. Hence, independent of n and k, the above inequality cannot be satisfied. This implies that the plurality rule is always vulnerable to majority decisiveness. In fact, inequality (1) cannot be satisfied for  $S_k = 1$ ,  $S_{k-1} = S_1 = 0$ , and any  $\alpha$ ,  $\frac{1}{2} < \alpha < 1$ . This means that, independent of n and k, under sincere voting, the plurality rule is vulnerable to any  $\alpha$ -majority decisiveness.
- (iii) Under the Borda rule, where  $S_k = k 1$ ,  $S_{k-1} = k 2$ , and  $S_1 = 0$ , inequality (2) reduces to n < k. Thus, the Borda rule is vulnerable to decisiveness of the majority if and only if  $n \ge k$ . In fact, independent of n, the Borda rule is immune to an  $\alpha$ -majority decisiveness if  $\alpha < (k-1)/k$ . An alternative form of the condition ensuring the immunity of the Borda rule to an  $\alpha$ -majority decisiveness is  $k > 1/(1 \alpha)$ . That is, a sufficient increase in the number of alternatives is an effective means of preventing the decisiveness of an  $\alpha$ -majority.

Theorem 1 and its consequences focus on majority decisiveness under sincere voting. Let us turn to the generalization of the theorem in the context of coordinated strategic voting.

**Theorem 2.** Let  $\alpha n = m(d+1)$  for some integer m. Under coordinated strategic voting of degree d, a scoring rule is vulnerable to an  $\alpha$ -majority decisiveness,  $1/2 < \alpha < 1$ , if

$$\alpha > \frac{S_k - S_1}{2S_k - S_1 - \bar{S}}, \text{ where } \bar{S} = \frac{1}{d+1} \sum_{j=k-(d+1)}^{k-1} S_j.$$
(3)

**Proof.** See the Appendix.

The condition that guarantees the vulnerability of a scoring rule to an  $\alpha$ -majority decisiveness requires that  $\alpha$  should be larger than an expression that depends on three factors: (i) the score assigned by every individual to the worst alternative,  $S_1$ ; (ii) the score assigned by every individual to the most preferred alternative,  $S_k$ ; and (iii) the average score  $\bar{S}$  assigned by the individuals exercising a degree of strategic voting d to the d+1alternatives whose rank was strategically coordinated. The proof of this theorem is based on the following idea: First, identify the most favorable circumstances (preference profile) for the majority and, then, derive the condition that ensures that, even in those circumstances, the  $\alpha$ - majority cannot impose its will. This condition certainly ensures that under any other less favorable situation the majority is unable to impose its will. Hence, if this condition is not satisfied, the scoring rule is vulnerable to an  $\alpha$ -majority decisiveness. The most favorable preference profile for the majority has the following two characteristics. First, the members of the majority coalition share the same view regarding their most preferred alternative. Second, the coordinated voting strategy of the majority group attempts to spread the total scores left to the group equally over the other alternatives and thus minimize the maximal total score assigned to any of the remaining alternatives. The following example clarifies the idea of the proof.

**Example 4.** The true preferences of three voters over the four alternatives a, b, c, and e are given in Table 5. Under sincere voting the Borda rule would select alternative b. However, the first two voters can report preferences as in Table 6, which would result in the selection of alternative a, provided that the reported preferences of voter 3 do not change. The alternative voting strategy of voters 1 and 2 might be plausible only if they form some particular beliefs regarding the reported preferences of voter 3, since the latter voter might as well report that his preference relation is e > c > b > a, in which case candidate e is selected, again, preventing the selection of e. Nevertheless, the two voters have an optimal coordinated voting strategy

that guarantees the selection of alternative a, regardless of the reported preferences of the third voter. According to this strategy the two voters sincerely report a as their best alternative and spread their remaining total points equally over the other three alternatives. That is, voter 1 reports the preference relation a > c > e > b and voter 2 reports the preference relation a > b > e > c. In this case, regardless of the preferences of the third voter, alternative a gains enough points to secure its selection (even if it receives no points from the third voter).

Under sincere voting, d=0,  $\bar{S}=S_{k-1}$ , and  $\alpha > (S_k-S_1)/(2S_k-S_1-S_{k-1})$  is the necessary and sufficient condition for the vulnerability of a scoring rule to an  $\alpha$ -majority decisiveness. This result is an alternative statement of Theorem 1.

Under unconstrained coordinated voting strategies, that is, when d=k-2,  $\bar{S}=[1/(k-1)]\sum_{j=1}^{k-1}S_j$  is the lower bound of the maximal score that can be assigned by the majority coalition to a candidate differing from the majority consensus. If  $\alpha n=m(d+1)$  for some integer m, then this bound is equal to that maximal score that is, in fact, the score assigned by the majority coalition to all k-1 candidates who are not the majority consensus. Theorem 2 has the following direct consequences.

- (i) Under unconstrained coordinated strategic voting, d=k-2, a scoring rule is immune to an  $\alpha$ -majority decisiveness,  $1/2 < \alpha < 1$ , if  $\alpha < (S_k S_1)/(2S_k S_1 \bar{S})$ .
- (ii) If  $\alpha n = m(d+1)$  for some integer m, then a scoring rule is immune to an  $\alpha$ -majority decisiveness,  $1/2 < \alpha < 1$ , if and only if  $\alpha < (S_k S_1)/(2S_k S_1 \bar{S})$ .
- (iii) By inequality (3) it can be readily verified that when d > 0, the plurality rule (where  $S_k = 1$  and  $S_1 = 0$ ) is vulnerable to an  $\alpha$ -majority decisiveness for any  $\alpha$ ,  $\frac{1}{2} < \alpha < 1$ .
- (iv) Under unconstrained coordinated strategic voting, d=k-2, and a sufficiently large number of voters, the Borda rule is immune to the decisiveness of an  $\alpha$  majority as long as  $\alpha \leq \frac{2}{3}$ . Figure 2

presents the combinations of  $\alpha$  and k resulting in immunity of the Borda rule to an  $\alpha$ -majority decisiveness under unconstrained strategic voting (d=k-2). The area of immunity in this case is contained in the area representing immunity under sincere voting (d=0).

The plurality rule is a scoring rule that can be considered as a restricted form of approval voting.<sup>17</sup> Theorem 2 implies that the vulnerability of the Borda rule to majority decisiveness is equal to the vulnerability of the scoring rule defined by the scores  $\{S_1, S_2, \ldots, S_n\}$  $S_{k-1}, S_k$  = {0, 0, ..., 0, 0, 1, 1, ..., 1, 1}. This rule is another restricted form of approval voting. In fact, the vulnerability of the restricted forms of approval voting to majority decisiveness can be equal to that of other representative scoring rules. Restricting the voters to the use of these rules may therefore preserve the potential of standard scoring rules such as the Borda rule to ameliorate majority decisiveness while considerably reducing the informational requirements of the elections. Put differently, majority decisiveness can be ameliorated by the simple and easy-to-implement restricted forms of approval voting.

When voting is sincere, the size of a decisive majority is relatively large. Under coordinated strategic voting the size of a decisive majority is reduced. However, coordinated strategic voting might be realistic in small committees but it is highly unrealistic when the number of voters is large. It can be shown that majority decisiveness is sustained by strong Nash equilibrium strategies. The decisiveness of the majority could therefore be based not on the requirement of coordinated strategic voting, but on the notion of strong Nash equilibrium. This implies that the implications of Theorem 2 are relevant for strategic voting by few or by many voters.

The last question we examine is whether effective unconstrained manipulations that result in an  $\alpha$ -majority decisiveness without requiring any knowledge or even any beliefs regarding the minority preferences can be prevented by the use of an appropriate scoring rule. The above four consequences of Theorem 2 directly imply that the answer to this question is positive.

**Theorem 3.** Under unconstrained strategic voting, d=k-2, and any number of voters  $n, k \ge n$ , there always exists a scoring rule that is immune to majority decisiveness.

**Proof.** See the Appendix.

#### CONCLUSION

The resolution of the problem of majority decisiveness is usually based on the application of voting rules that neither are unbiased toward the voters and/or toward the alternatives nor allow the expression of preference intensities. The question motivating this study is whether the amelioration of majority decisiveness can be attained by unbiased voting rules that do allow expression of preference intensities. The affirmative answer to this question is the main message of our analysis. It implies that the amelioration of majority decisiveness need not be based on a voting rule that is biased in favor of alternatives (the "just" ones) or in favor of voters (the minority-group members). Specifically, scoring rules are the unbiased voting rules that enable the resolution of the majority-decisiveness problem by allowing the expression of preference intensities. The effectivity of these rules as a means of resolving the problem of tyrant majorities has been demonstrated under sincere voting as well as under any degree of coordinated strategic voting.

Scoring rules are defined in terms of fixed scores. Our analysis implies that a possible rationale for this rigidity is that the restricted common pattern of expression of preference intensities imposed on voters who use a scoring rule is precisely the means that enables the resolution of the majority-decisiveness problem. The unrestricted point-voting scheme is a flexible scoring rule where voters are assigned an equal number of scores and no constraint is imposed on the allocation of the initial endowment of the scores among the candidates.<sup>19</sup> Under this flexible scoring rule, the optimal strategy for every member of a majority coalition interested in securing the selection of the majority consensus, the most preferred candidate from the viewpoint of the majority is to overload his vote points on the majority consensus. Such a strategy is always effective in ensuring the selection of the candidate preferred by the majority. In other words, it results in decisiveness of the majority. The fixed scoring rules impose a fixed uniform pattern of expression of preference intensities on all voters. Despite this restriction, voters can still vote strategically and assign the enforced fixed scores in a way that best serves their true interest. Under a scoring rule, the most effective strategy for every member of a majority coalition interested in securing the selection of the majority consensus candidate is to report sincerely that candidate as his most preferred one. As for the remaining candidates, effective strategic majority voting requires that the members of the majority coalition coordinate their reported preferences to avoid overloading of vote points as much as possible. Specifically, the interest of the majority coalition is to spread the coalition's assigned points equally over the remaining candidates, subject to the constraint of the point allocation permitted by the scoring rule. Whether or not such a strategy is effective depends on the scoring rule in use and on the size of the majority. Our main result states the condition ensuring the effectivity of a scoring rule in preventing decisiveness of the majority.

As is well known, the use of scoring rules involves payment of a price because these rules are highly manipulable and vulnerable to some embarrassing voting

<sup>17</sup> See footnote 8.

<sup>&</sup>lt;sup>18</sup> We are indebted to Steve Brams for calling our attention to this point. Note that our analysis is confined to the existence of a decisive  $\alpha$  majority, that is, to situations in which members of an  $\alpha$ -majority group prefer the selection of the same candidate. In such situations there are multiple strong Nash equilibria characterized by inequality (3), given d and the scores  $S_1, \ldots, S_k$ .

anomalies. The question is whether their well known axiomatic advantages and their ability to resolve the decisiveness majority problem, an advantage that has been the main concern of this study, justify the payment of such a price.

In the literature voting rules have been compared in terms of their axiomatic properties, in terms of the degree they satisfy a particular desirable property such as the Condorcet (1785) criterion or decisiveness (stability), in terms of their informational requirements, or in terms of their vulnerability to strategic manipulations or some undesirable voting anomalies. In this paper we proposed a new criterion for comparing voting rules, namely, their susceptibility to decisiveness of the majority. We have applied this criterion in the comparison of two notable voting rules, the plurality rule and the Borda rule. A comprehensive comparative study of other voting rules based on the proposed criterion, which is beyond the scope of our study, will certainly constitute a further contribution to the theory of voting.

#### **APPENDIX**

Let  $N = \{1, ..., n\}, n \ge 3$ , denote a finite set of voters; A, a finite set consisting of k distinct alternatives,  $k \ge 3$ ; and L(A), the set of linear orderings (complete, transitive, and asymmetric relations) over A. Voter i's preferences,  $i \in N$ , are denoted  $u^i \in L(A)$ . A preference profile is an *n*-tuple  $u = \{u_i\}_{i \in N} \in L(A)^n$ , the set of linear profiles on  $A^{20}$  A voting rule V is a mapping from  $L(A)^n$  to the set of nonempty subsets of A. V(u) describes the alternatives selected by the voters at the preference profile u. In this study we focus on voting rules that are usually referred to as scoring rules.21

**Definition.** The degree of strategic voting, d, an integer that satisfies  $0 \le d \le k-2$ , is the maximal deviation between the true and the reported ranking of any alternative by any voter.

**Definition.** A d-message is a preference profile in which the degree of strategic voting is equal to d.

**Definition.** Given a voting rule V, a coalition of voters T is d-decisive if at every preference profile  $u^{a(T)}$  where alternative a is the T-majority consensus, T has a d-message in  $L(A)^{t}$ , t = |T|, that ensures the selection of a.<sup>22</sup>

Majority decisiveness can now be defined in terms of ddecisiveness.

**Definition.**  $\alpha$ -Majority decisiveness means that there exists a coalition T,  $|T| = \alpha n$ ,  $1 > \alpha > 1/2$ , and a degree of strategic voting d,  $0 \le d \le k - 2$ , such that T is d-decisive.

**Definition.** Majority decisiveness means that an  $\alpha$ majority decisiveness exists for some  $\alpha$  and d,  $1 > \alpha > 1/2$ ,  $0 \le d \le k-2$ .

A tyrant  $\alpha$ -majority is represented by the parameters  $\alpha$ and d, namely, by the size of the decisive majority and by the degree of strategic voting exercised by its members. Recall that the severity of the decisiveness problem decreases with both of these parameters.

A veto function is defined as follows (Moulin 1988, 72).

**Definition.** Given the set of alternatives A and a group of voters N with respective cardinalities k and n, an anonymous veto function is a nondecreasing function v from  $\{1, \ldots, n\}$  to  $\{0,\ldots,k-1\}$ , where v(t)=m means that any coalition of size t can veto (prevent the election of) any subset with at most m alternatives.

**Theorem 1.** Under sincere voting, d = 0, a scoring rule is immune to an  $\alpha$ -majority decisiveness,  $\frac{1}{2} < \alpha < 1$ , if and only

$$\alpha(S_k - S_{k-1}) < (1 - \alpha)(S_k - S_1).$$

**Proof.** Consider a preference profile where all  $\alpha n$  members of an  $\alpha$ -majority coalition,  $\frac{1}{2} < \alpha < 1$ , share the same preference regarding the best (most preferred) alternative a and regarding the second best alternative  $b^{23}$ . Also suppose that in this profile the minority voters' best alternative is b and their least preferred alternative is a. Notice that if the majority consensus alternative a is selected under such a most unfavorable profile, namely, under a profile where the majority consensus a gets minimal support from the minority and the challenger b receives maximal support from the members of both the majority and the minority coalitions, then the majority consensus a is selected under any other profile, so, by definition, the majority is decisive. Hence, an  $\alpha$ -majority decisiveness does not exist if, under the assumed most unfavorable profile, the total score of alternative a is less than the total score of b. That is, the condition ensuring immunity to decisiveness of an  $\alpha$  majority is

$$\alpha nS_k + (1-\alpha)nS_1 < \alpha nS_{k-1} + (1-\alpha)nS_k,$$

which is equivalent to (1). The proof is therefore complete.

**Theorem 2.** Let  $\alpha n = m(d+1)$  for some integer m. Under coordinated strategic voting of degree d, a scoring rule is vulnerable to an  $\alpha$ -majority decisiveness,  $\frac{1}{2} < \alpha < 1$ , if

$$\alpha > \frac{S_k - S_1}{2S_k - S_1 - \bar{S}}, \quad \text{where} \quad \bar{S} = \frac{1}{d+1} \sum_{j=k-(d+1)}^{k-1} S_j.$$

**Proof.** Consider a preference profile where all  $\alpha n$  members of an  $\alpha$ -majority coalition,  $\frac{1}{2} < \alpha < 1$ , share the same preference regarding the best alternative  $a.^{24}$  To impose the selection of its consensus alternative a, that is, to be d-decisive, the  $\alpha$ -majority coalition must prevent the selection of any alternative other than candidate a at all possible preference profiles. An optimal strategy for attaining this goal must have two components. First, such a strategy requires that every member of the majority coalition sincerely reports the majority consensus a as his most preferred candidate. Second, such a strategy requires the minimization of the maximal total score assigned by the majority coalition to one of the remaining k-1 alternative candidates, that is, to the "coalition's reported second-best" candidate. This means that the majority-coalition members need to coordinate their reported preferences to avoid overloading of scores as much as possible. That is, they have to spread the coalition's assigned scores equally over the remaining k-1 candidates, subject to

 $<sup>^{20}</sup>$  The notation and the definitions of scoring rules follow those of Moulin (1988).

<sup>21</sup> See footnote 5.

<sup>&</sup>lt;sup>22</sup> d-Decisiveness is a special case of the widely used notion of winning (see, e.g., Moulin 1988). Given a voting rule V, a coalition of voters T is a winning coalition if, for every candidate a, coalition T has a message  $u_T \in L(A)^t$  that ensures the selection of a. That is,  $\forall u_{N-T} \in L(A)^{n-t}$ ,  $V(u_T, u_{N-T}) = a$ .

 $<sup>\</sup>overline{^{23}}$  To simplify the proof and with no loss of generality, we select  $\alpha$ such that  $\alpha n$  is an integer. <sup>24</sup> Again, to simplify the proof and with no loss of generality, we

the constraint of the scores  $\{S_1, S_2, \ldots, S_{k-1}\}$  that must be assigned to these candidates and subject to the constraint on the permitted degree of manipulation d. Under these constraints, even if the coalition members share the same preference relation (not only the same best alternative), where the score assigned by the coalition to its true second-best alternative under sincere voting is the maximal possible score  $(\alpha n S_{k-1})$ , the  $\alpha$ -majority coalition can ensure that the average score Sassigned by its members to the coalition's reported secondbest candidate is only equal to  $1/(d+1)\sum_{j=k-(d+1)}^{k-1} S_j$ . Since, by assumption,  $\alpha n = m(d+1)$  for some integer m, this average score is achieved when the coalition members' reported preferences are cyclical over the d+1 alternatives that are ranked as second, third, and so on, up to the d+2 position (the scores assigned to these alternatives range from  $S_{k-(d+1)}$  to  $S_{k-1}$ ). Such a strategy is effective, that is, the  $\alpha$ -majority coalition is decisive if the lowest possible total score assigned to candidate a under any preference profile,  $\alpha nS_k + (1-\alpha)nS_1$ , is greater than the highest possible total score that can be assigned to any other alternative under any preference profile,  $\alpha n \bar{S} + (1 - \alpha) n S_k$ . That is, a sufficient condition for an  $\alpha$ -majority decisiveness is

$$\alpha nS_k + (1-\alpha)nS_1 > \alpha n\bar{S} + (1-\alpha)nS_k$$

which is equivalent to the requirement that  $\alpha > (S_k - S_1)/$  $(2S_k - S_1 - \bar{S}).$ 

**Theorem 3.** Under unconstrained voting manipulations, d=k-2, and any number of voters  $n, n \ge k$ , there always exists a scoring rule that is immune to majority decisiveness.

**Proof.** Consider the strict scoring rule defined by the strictly monotone sequence  $\{S_1, S_2, \ldots, S_k\}$  that satisfies  $S_k < (n-1)/(n-2)\bar{S}$ , where  $\bar{S} = [1/(k-1)] \sum_{j=1}^{k-1} S_j$ . By implications (i) and (ii) of Theorem 2 and the definition of majority decisiveness, this scoring rule is immune to majority decisiveness. The existence of the inequality is guaranteed by the possibility to control  $\bar{S}$ , making it as close as needed to  $S_k$ .

### **Informative Precedent and Intrajudicial Communication**

Te develop an informational model of judicial decision-making in which deference to precedent is useful to policy-oriented appellate judges because it improves the accuracy with which they can communicate legal rules to trial judges. Our simple model yields new implications and hypotheses regarding conditions under which judges will maintain or break with precedent, the constraining effect that precedent has on judicial decision-making, the voting behavior of Supreme Court Justices, the relationship between a precedent's age and its authority, the effect of legal complexity on the level of deference to precedent, the relative stability of rules and standards, and long-term patterns of legal evolution. Perhaps most importantly, we demonstrate that "legalist" features of judicial decision-making are consistent with an assumption of policy-oriented judges.

olitical scientists have long recognized the importance of courts as political actors. However, while an extensive literature examines the judiciary's strategic interaction with the other branches of government (e.g., Ferejohn and Weingast 1992; Gely and Spiller 1992), less attention has been paid to the effects of the institutional structure of the courts themselves on patterns of judicial decision-making. Yet models of the judiciary's unique institutional dynamics are essential to understanding the courts, just as analyses of congressional committees (e.g., Gilligan and Krehbiel 1990; Shepsle and Weingast 1987) or the bureaucracy (e.g., Moe 1982) are essential to understanding the legislative and executive branches. We develop a formal model that demonstrates how the problem of communication between different levels of a hierarchical court system. such as the one in the United States, can, under some conditions, give judges incentives to defer to precedents established in prior cases and how this constraining effect influences the policy decisions made by the

This approach sheds light on one of the most perplexing and controversial problems in the social-scientific study of judicial behavior: the debate over the relative importance of legal and policy concerns in judicial decisions. Scholars subscribing to policy-oriented models of judicial behavior argue that judges are concerned with the external effects of their rulings on allocations of risk, wealth, power, or opportunity. Judges may be

motivated by policy concerns because of partisan loyalties, a sincere desire to effect particular changes in the world, or pursuit of promotion or reelection. Whatever the reason, the policy-oriented judge cares about actual judicial "outputs" more than any particular method of arriving at those outputs. Others, however, argue that judges are concerned with "legalism," that is, with correctly following the rules and norms of proper judicial reasoning. A legalist judge maximizes utility by adhering faithfully to these internal rules, regardless of the external result. The purely policy-oriented judge and the purely legalist judge are of course ideal types, and few scholars, if any, believe that judges are motivated solely by concern with external effects or by fidelity to internal norms. Nonetheless, these two sets of factors are often presented as competing explanations for judicial behavior, and their relative importance is the subject of heated debate (e.g., Knight and Epstein 1996; Segal and Spaeth 1996a, b; Songer and Lindquist 1996).

We contribute to the discussion of the nature of judicial decision-making by demonstrating that "legalist" principles are, at least in some cases, compatible with and in fact explained by-judges' concerns with the external policy effects of their rulings. Focusing on one central principle of judicial decision-making in Anglo-American legal systems—stare decisis, or deference to precedent—we show that purely policy-oriented judges will often defer to legal precedent, even when doing so requires them to issue decisions that deviate from the rulings they otherwise would prefer. The reason for this is that appellate judges can use prior cases to increase the accuracy of their communication with trial judges. Often, a judge is willing to modify the substantive ruling in order to purchase this increased accuracy in communication. Thus, in the model we present, it is not the case that policy-oriented judges ignore precedent, nor is it the case that judges care about precedent instead of, or in addition to, caring about policy. Rather, judges care about precedent because they care about policy.

<sup>&</sup>lt;sup>1</sup> Both the "attitudinal model" (Segal and Spaeth 1993) and the "strategic model" (Knight and Epstein 1998) of judicial behavior are "policy-oriented," in that both models assume judges are primarily concerned with substantive outcomes.

In addition to demonstrating this basic idea, our model has the advantage of being able to account systematically for both adherence to and departure from precedent. Specifically, our comparative static analysis shows how variation in four parameters—the distance between the existing legal rule and the deciding judge's ideal, the age of the existing precedent, the difficulty of intelligibly integrating existing precedent with new rulings, and the precision or imprecision of communication between judges—affects the relative likelihoods that a judge will adhere to or break with existing legal precedent. Our model also has implications for how much judges are able to change the substantive law without ever openly breaking from established precedent. Further, our informational model of stare decisis sheds light on other important empirical puzzles in the study of judicial decision-making. We reconcile the seemingly contradictory observations that arguments from precedent play a major role in U.S. Supreme Court deliberation and adjudication, and yet justices consistently vote their preferences rather than following established precedents. Our approach also offers an explanation for why long lines of cases might evoke both deference and skepticism. Finally, our model yields several novel hypotheses, including predictions regarding the types of legal issues in which long lines of precedent will emerge, the relative stability of clear rules versus flexible standards, and patterns of longterm legal evolution.

### COMPETING THEORIES OF JUDICIAL DECISION-MAKING

We focus on the principle of stare decisis,<sup>2</sup> which dictates that judges ought to apply rules and principles laid down in prior cases, because it is, or at least is claimed to be, one of the most important principles of judicial decision-making in the Anglo-American common law system (e.g., Schauer 1987). Judges are not, in ordinary circumstances, supposed to overturn "settled law" (Nelson 2001).3 Our focus on stare decisis is also due to its salience for the more general question of the nature of judicial preferences. Judicial deference to established precedent is a focus of the debate between the policy-oriented and the legalist models of judicial decision-making because these models seem to offer such different predictions for how important precedent will be in practice. A legalist judge is expected to place great weight on the stare decisis principle and consequently is expected to defer to prior decisions even

when that judge would have decided the precedentsetting case differently.<sup>4</sup>

In contrast, it is not clear why a policy-oriented judge would ever defer to constraints imposed by prior decisions. It may be that judges often agree with the principles laid down in old cases and follow them for that reason, but if this is the case, then stare decisis is merely a description of—rather than a reason for—patterns of judicial decision-making. To the extent that a legal precedent exerts a causal influence on at least some judicial decisions, it must be the case that in these decisions judges would prefer to issue a different ruling if the precedent did not exist. Thus, a policy-oriented judge would be expected to attach little importance to established precedent when making decisions.

Scholars have offered a number of reasons why even a policy-oriented judge might want to respect established legal precedent. One argument—the one most familiar to lawyers—is that stability in the law is in itself a valued policy goal, and judges would therefore be willing to defer to an established legal rule because the act of deference itself advances their policy preference for stability. But this explanation has a difficult time accounting for adherence to precedent in areas of law where stability and the need for long-term planning are less salient. Perhaps more importantly, stability in the law is a collective good; for a given judge to sacrifice other policy goals for the sake of stability, that judge must believe that other judges will also value stability sufficiently highly that they will not overturn precedent. But if a judge believes that other judges do place a high value on stability, that judge may be tempted to break with precedent and establish a new legal rule, since it will be respected by future courts with little overall loss in legal stability. Additionally, the value of legal stability to a judge is considerably reduced if the stable legal rule is objectionable (Kornhauser 1989). While the need for stability may be enough when the judge is indifferent between legal rules, it is a less plausible basis for deference to precedent when the judge has strong substantive preferences between rules.

Another suggestion as to why policy-oriented judges might respect the principle of stare decisis is that judges want their own precedents followed and, therefore, follow precedents set by others (Landes and Posner 1976; Rasmusen 1994). Because judges prefer a world in which all precedents, including their own, are respected to a world in which no precedents are respected, they will attempt to enforce universal respect for precedent by punishing judges who "defect." While there may be some of this tit-for-tat in the real world, this

<sup>&</sup>lt;sup>2</sup> Stare decisis et non quieta movere—"Stand by the thing decided and do not disturb the calm."

<sup>&</sup>lt;sup>3</sup> One aspect of this principle is the idea that lower courts are supposed to follow the precedents set by higher courts (vertical stare decisis). This is not much different from the principle in many hierarchical organizations that subordinate units are supposed to follow the directions and guidelines laid down by their superiors. A more interesting aspect of the stare decisis principle—and one more unique to judicial decision-making—is the principle that courts are supposed to follow their own prior decisions (horizontal stare decisis).

<sup>&</sup>lt;sup>4</sup> This might not always be the case since there might be some other "legal" principle, e.g., the proper interpretation of a statute, that could trump the principle of deference to decided cases even for a legalist judge. Nonetheless, as a general rule it is safe to assume that legalist judges in a common law system would attach substantial weight to precedent.

<sup>&</sup>lt;sup>5</sup> If there is not specific, targeted retaliation against particular judges for failing to follow precedent, the general judicial interest in precedent-following alone is insufficient because respect for precedents is a collective good and individual judges' dominant strategy would be to free-ride (Macey 1989).

explanation has several problems as a general account of the practice of *stare decisis*. First, it relies on the empirically dubious assumption that judges look to other judges' respect for legal precedent when determining whether to follow precedent set by those judges. Second, it has trouble accounting for why the precedents of retired judges are ever followed without reference to even more complicated, and empirically problematic, punishment mechanisms. Third, in the absence of such mechanisms, this explanation also does not explain well why some judges break with some precedents but follow others. In a simple model where judges expect general retaliation for any break with existing precedent, if they break once, they have no reason not to break always.

A third possibility is that policy-oriented judges do not care about precedent per se but recognize the need to preserve their institutional power and legitimacy. Because this legitimacy derives in part from a public belief that judges apply a specialized set of legal skills, including the ability to interpret and apply established legal precedents, as well as a belief that judges are politicallyneutral interpreters of law, policy-oriented judges will want to perpetuate the belief that they make decisions according to precedent (Cox 1976; Maltz 1980). This may in turn lead them to modify their decisions sometimes to show more respect for precedent in order to enhance their institutional power. However, the collective action objection applies to this explanation as well; the overall effect of any particular decision on institutional legitimacy is likely to be small, while the policy ramifications of the case itself often are large. Moreover, the effect of a decision on public perception of the court's legitimacy may have more to do with the content of the decision than whether it involved overturning a precedent (e.g., Hyde 1983; Nelson 2001).

Finally, several studies point out that deference to precedent may be valuable even to policy-oriented judges because of the informational function that judicial precedents serve (e.g., Rehnquist 1986; Shapiro 1972). The informational perspective comprises two types of explanations for deference to precedent. First, reasoning from precedents may improve communication between appeals courts, allowing for judicial specialization and error correction (e.g., Kornhauser 1989; Macey 1989). A more pessimistic version of the same basic argument is that the practice of *stare decisis* is essentially an "information cascade" in which rational agents ignore their own information and imitate the behavior of preceding decision-makers, often leading to uncorrected inefficient results (Talley 1999).

We suggest a second informational function that the doctrine of *stare decisis* might serve. This function involves communication between high courts and lower courts. The basic idea is that the development of lines of cases can communicate a legal principle better than any individual case could. An initial case may invoke a general phrase or principle, such as "due process," "reasonable," or "compelling interest"; future cases develop and give meaning to these inherently vague phrases. Hence, a lower court can learn more about the appellate court's view of the proper interpretation

of, say, a due process balancing test by examining a line of 10 cases in which the same test was applied than by reading the first (or the last) ruling the appeals court issued. Similarly, an initial case might declare a bright-line rule that, though clear, is both over- and underinclusive. Further cases can carve out exceptions and make qualifications so that the line of cases applying the rule offers lower courts a much more nuanced test than that announced by the original decision.

Our model explores this second type of informational use of legal precedent, a use that we believe has been neglected in the scholarly discussion of judicial decision-making and that has not been formally developed or rigorously analyzed. In so doing, we provide an account of judicial decision-making that explains why policy-oriented judges are expected to be influenced by precedent, while also capturing cases where judges break from precedent.

#### THE MODEL

Consider a simple judicial system consisting of an appellate judge and a trial judge. The appellate judge hears a limited number of cases, and, through the decisions in these cases, the appellate judge can announce how the law ought to be interpreted. The trial judge decides the vast majority of cases. We make the simplifying assumption that when making decisions the trial judge attempts to apply established law, without reference to the trial judge's own personal policy preferences. There are several possible substantive defenses of this assumption that could ultimately be modeled explicitly. These include considerations such as promotion being dependent on strict adherence to the law established by appellate decisions, a desire not to be overturned on appeal, and other factors. For the purposes of this model, it suffices to assume that some mechanism exists that leads the trial judge to behave as a faithful agent of the appellate judge. While we assume a nonstrategic trial judge, we do address the conditions under which a strategic trial judge might behave in this way later in the paper.

The trial judge's understanding of appellate rulings is imperfect, and the trial judge often does not decide cases exactly as the appellate judge would have. The appellate judge cannot correct all these "mistakes" by altering or reversing the trial court's decision on appeal. This may be because the appellate court's jurisdiction is discretionary and many appeals are not heard (e.g., U.S. Supreme Court review of circuit court decisions) or because many cases are not appealed despite the existence of an automatic right to an appeal (e.g., federal circuit court review of district court decisions). Thus, the appellate court judge, to influence the application of the law to the majority of cases successfully, needs to communicate a preferred interpretation of the law to the trial court as accurately as possible, subject to time

and resource constraints.

<sup>&</sup>lt;sup>6</sup> A bright line rule is a rule that minimizes ambiguity by setting well-defined and simple categories of prohibited and permissible behavior.

The appellate judge has preferences over the legal rule defined on a unidimensional continuum. Denote the appellate judge's ideal point  $j \in \mathbb{R}$ . The policy continuum might represent, for example, the level of care exercised by a defendant in a civil action, with j representing the minimum amount of care the appellate judge believes a defendant must exercise to avoid liability. That is, the appellate judge in this example believes that all defendants who exercise a level of care less than j ought to be liable, and all defendants who exercise a level of care above j ought to escape liability. As such, j is the appellate judge's ideal legal rule. The trial judge has no preference over the policy dimension per se; rather, the trial judge tries to implement whatever the appellate judge has declared to be the proper legal rule.

When deciding a case, the appellate judge issues a ruling with two components. First, the appellate judge announces a substantive holding on the proper application of the legal rule to the case at hand. This substantive holding corresponds to a point in the policy space, denoted  $r \in \mathbb{R}$ . Second, the appellate judge declares whether this substantive holding is consistent with existing precedent or whether the appellate judge is breaking with precedent. "Precedent" here means the line of appellate cases on the relevant legal issue that have been decided prior to the present case and that have never been overruled by a subsequent appellate case. Prior decisions are not assumed all to have been made by the current appellate judge. Rather, one can think of the game beginning with an existing line of precedent that may have been established before the current appellate judge took office. If the appellate judge issues a holding and declares that it is consistent with precedent, then the case is added to the relevant line of cases, and the trial judge will interpret the appellate judge's substantive holding in the context of the other substantive holdings in the line to ascertain the legal rule the appellate judge wishes to enact. If, however, the appellate judge declares a break with precedent, then a new line of cases is established, and the trial judge will treat the most recent appellate decision as the exclusive statement of the legal rule.8 The number of cases in the line of precedent, including the decision being made in the current round, is denoted t. Thus a line of precedent is a series of substantive rulings  $(r_1,$  $r_2, \ldots, r_{t-1}$ ), where  $r_{t-1}$  is the most recent ruling and the current appellate judge issues ruling  $r_t$ .

The declaration that the appellate judge is maintaining or breaking from precedent is communicated perfectly to the trial judge. However, the communication of the substantive holding of each ruling is inher-

ently noisy. Thus the trial judge, when attempting to understand an appellate ruling, observes t signals, each drawn from a normal distribution with variance  $\sigma^2$ . The means of these distributions are the rs associated with the substantive holdings of the different cases in the line of precedent. The trial court judge averages these signals to estimate the legal rule. Thus, the trial judge's estimate of the legal rule is a sum of a series of normally distributed random variables. Such a sum is itself a normally distributed random variable. Consequently, the trial court's estimate can be treated as if it were a single signal, denoted x, drawn from a normal distribution with mean  $\mu_t = (\sum_{i=1}^t r_t)/t$  and variance  $\sigma^2/t$  (DeGroot 1970).

It is important to stress that the trial judge does not actually believe that all of the observed signals are drawn from a single distribution. If the trial judge did believe this, signals far from the estimated mean would make the trial judge less confident in this estimate. However, the trial judge recognizes that the various observed signals are drawn from different distributions with different means, reflecting earlier decisions, potentially made by different appellate judges. Given that the trial judge aggregates these signals, each additional signal, no matter how far it is from the mean, decreases the variance of the trial judge's estimate of the legal rule to be implemented. This variance is the variance of the trial judge's estimate of the variance of a single underlying distribution.

If the appellate judge breaks with precedent, there is only one decision in the line of cases, so t=1 and the trial judge receives a signal drawn from a normal distribution with mean  $r_{t=1}$ , the most recent appellate holding, and variance  $\sigma^2$ . The mean of the distribution

<sup>&</sup>lt;sup>7</sup> We refer to the judge's preferences over this continuum as policy preferences; however, we use policy broadly, to reflect public-policy preferences, normative judgments regarding fairness or justice, or a weighted combination of various factors.

<sup>&</sup>lt;sup>8</sup> The discrete binary choice between maintaining and breaking with precedent is a simplifying assumption. Clearly, in the real world, multiple lines of precedent may be in play in any given decision and the judge may decide to maintain parts of existing precedent. Framing the issue in the manner that we do captures in starkest form the same essential decision problem that would arise in more complex adjudicative choices.

<sup>&</sup>lt;sup>9</sup> The trial judge could, in theory, aggregate these signals in some other way (for example, by taking a weighted average), and this would in turn change the optimal decision of the appellate judge. We focus attention on a simple average for the following reasons. First, including the possibility of a weighted average would not alter the appellate judge's basic decision problem—the trade-off between greater precision (if the appellate judge's holding is aggregated with those of other judges) and the opportunity to announce the judge's most preferred legal rule (if the trial judge looks only at the appellate judge's ruling). The unweighted average is thus the simplest among a class of similar aggregation rules, any of which might be reasonable depending on other background institutional assumptions. Second, calculating the optimal weighted average is itself a complex problem that depends on the appellate judge's deriving the optimal weights as a function of the appellate judge's preferences and existing precedent. Third, not only is this calculation complex for the appellate judge, but the proper weights, once calculated, would have to be communicated to the trial judge. This communication, like the communication of the substantive holding, would be inherently noisy. Thus, the calculation and transmission of appropriate weights-essentially, a more refined and sophisticated principle of stare decisis—introduces another level of complexity that, though interesting, is beyond the scope of this paper and is therefore left to future research.

In particular, if  $X_1, \ldots, X_n$  are independent random variables and  $X_i \sim N(\mu_i, \sigma_i^2)$ ,  $i = 1, \ldots, n$  and  $a_1, \ldots, a_n$  are constants such that  $a_i \neq 0$  for at least one i, then the random variable  $a_1 X_1 + \cdots + a_n X_n$  is normally distributed with mean  $a_1 \mu_1 + \cdots + a_n \mu_n$  and variance  $a_1^2 \sigma_1^2 + \cdots + a_n^2 \sigma_n^2$ . (DeGroot 1970, 38). In our case, the trial judge is taking an average,  $a_i = (1/t)$ ,  $\mu_i = r_t$ , and  $\sigma_i^2 = \sigma^2$  for  $i = 1, \ldots, t$ . Consequently the average of the signals is itself a random variable with mean  $\mu_t = (\sum_{t=1}^t r_t)/t$  and variance  $\sigma^2/t$ .

of the signal in the period prior to the current appellate judge's decision is denoted  $\mu_{t-1}$ , and we refer to this value as "existing precedent." Because x (the value of the draw from the distribution of the trial court's estimate) is the only information that the trial judge has, it is the trial judge's best guess as to what the appellate judge wants. Consequently the trial judge will treat x as the controlling legal rule when deciding cases.

The appellate judge's utility has two components. First, the appellate judge would like the decisions of the trial court judges to be as close as possible to the appellate judge's own ideal point. That is, the appellate judge wishes to minimize |x-i|. The reason for this is that any cases that fall in this interval are cases that the trial judge will get "wrong" from the appellate judge's point of view. Again, consider a case in which the policy dimension represents the level of care taken by a tort defendant. If the defendant exercised a level of care less than the minimum of x and j, the trial court will correctly find the defendant liable. Similarly, if the defendant exercised a level of care above the maximum of x and j, the trial court will correctly find the defendant not liable. However, when the defendant exercised a level of care in the interval between x and i, the trial court will rule incorrectly. In this event, if x > j, the trial court will mistakenly find liability, while if x < j, the trial court will mistakenly find no liability. The larger the size of the interval |x-j|, the larger the number of cases that will be decided incorrectly. We assume that the appellate judge's utility function is quadratic—that is, the appellate judge wants to minimize the expected value of the square of the distance between x and j, which is equal to  $((\mu_t - j)^2 + (\sigma^2/t))$ .

Second, if the appellate judge does not announce a break with precedent, it is costly to offer a ruling,  $r_t$ , that is substantively different from the existing precedent,  $\mu_{t-1}$ . We are agnostic as to the relative importance of these two factors in the appellate judge's utility calculation; we weight the importance of the latter by the parameter  $\alpha \geq 0$  on which we perform comparative static analysis.<sup>11</sup> Thus, the utility cost associated with changing the law while claiming to adhere to precedent is  $\alpha(\mu_{t-1} - r_t)^2$ . If the appellate judge breaks with precedent, this cost does not apply.

This cost arises because writing an opinion that intelligibly integrates existing precedent with a change in the substance of the legal rule becomes increasingly difficult as the distance between precedent and the substantive holding grows. Thus, there are real costs in intellectual effort and research associated with such a decision. If these costs are not invested, that is, if the appellate judge were to declare that a decision was consistent with precedent without explaining how the

substance of the ruling and prior rulings could be intelligibly integrated, then the trial judge would be unable to make decisions with reference to the full line of cases. This aspect of the model captures the intuition that trial judges would have difficulty simply averaging signals that are quite distant from one another. Trial judges are able to aggregate such signals only if the appellate judge has invested substantially in explaining how to do so. This effort is costly to the appellate judge and becomes more costly the greater the distance between the appellate holding and existing precedent, reflecting the increasing difficulty of the trial judge's task. In our model the intuition that it would be difficult for the trial judge to aggregate a sharply divergent holding into existing precedent is captured by the costliness to the appellate judge of making such a holding.

One might object to the assumption that judges bear a cost when maintaining precedent but do not bear a cost when breaking with precedent. However, the assumption is benign with respect to the conclusions of our model. Our analytic results are unchanged by the addition of a fixed cost for breaking with precedent. Such a cost would change the actual point at which appellate judges break but would not affect the comparative statics. There is a second, more conceptual justification for making this assumption. Any cost from breaking with precedent, beyond the loss of information already modeled, would arise from legalist values. We omit legalist values from the judicial utility function to see whether the norm of stare decisis is consistent even with purely policy-oriented judges and, indeed, whether what appear to be legalist values may emerge as a result of policy motivations.

The expected utility to the appellate judge is therefore

$$EU = -\left((\mu_t - j)^2 + \frac{\sigma^2}{t}\right) - \tilde{\alpha}(\mu_{t-1} - r_t)^2,$$

where  $\tilde{\alpha} = \alpha$  if the appellate judge maintains precedent and  $\tilde{\alpha} = 0$  if the appellate judge departs from precedent.

#### **ANALYSIS**

#### The Appellate Judge's Decision

The appellate judge has two choices to make. The appellate judge must select a substantive holding  $(r_t)$  and must also decide whether to declare a break with precedent. These two decisions are interrelated. To determine whether or not to break with precedent, the appellate judge must first know the expected outcomes, which are a function of the different substantive rulings that the appellate judge would issue depending on whether or not precedent is maintained. Thus, we work backward, first determining the appellate judge's optimal substantive holding contingent on whether the judge has broken with or maintained precedent.

If the appellate judge breaks with precedent, the second term in the judge's expected utility function is zero, because  $\tilde{\alpha}=0$ . Further, because the appellate judge has broken with existing precedent, t reverts to 1. Therefore, the line of cases considered by the trial judge

 $<sup>^{11}</sup>$  If  $\alpha>1$ , this implies that the cost of writing the decision is weighted more heavily than how close the trial court's decision is to the appellate court's ideal point. If  $0 \leq \alpha < 1$ , the closeness of the trial court decision to the appellate judge's ideal point is weighted more heavily. If  $\alpha=0$ , adherence to precedent is costless no matter how much the legal rule is changed substantively; in this special case, the appellate judge would always claim to adhere to precedent, because doing so imposes no constraints whatsoever on the distance the appellate judge can move the legal rule.

contains only the appellate judge's most recent decision, that is,  $\mu_{t=1} = r_{t=1}$ . It is obvious that the appellate judge's expected utility in this case is maximized when  $r_t = \mu_t = j$ . Thus, if an appellate judge breaks with precedent, the substantive holding will be the judge's ideal legal rule, and the judge's expected utility in this case, EU(break), is  $-\sigma^2$ .

If the appellate judge does not break with precedent, the decision is more complicated. The appellate judge would like to issue a ruling that moves precedent toward the judge's own ideal point but is constrained by the cost of deviating too much from the line of precedent of which this decision becomes a part. The appellate judge thus chooses  $r_t$  by solving the following maximization problem:

$$\max_{r_t} \left\{ - \left[ (\mu_t - j)^2 + \frac{\sigma^2}{t} \right] - \alpha (\mu_{t-1} - r_t)^2 \right\}.$$
 (1)

Note that  $\mu_t$ , the mean of the distribution of the trial judge's estimate of the legal rule, is a function of  $r_t$ . In particular,  $\mu_t = [(t-1)\mu_{t-1} + r_t]/t$ . Thus, we can rewrite the maximization problem

$$\max_{r_t} \left\{ -\left[ \left( \frac{(t-1)\mu_{t-1} + r_t}{t} - j \right)^2 + \frac{\sigma^2}{t} \right] - \alpha(\mu_{t-1} - r_t)^2 \right\}. \tag{2}$$

Solving for the first-order condition yields

$$r_t^* = \mu_{t-1} + \frac{t(j - \mu_{t-1})}{1 + \alpha t^2}.$$

Knowing the optimal substantive holding,  $r_t^*$ , allows us to calculate the mean of the new distribution from which the trial court judge will draw an estimate of the proper legal rule. This new mean,  $\mu_t^*$ , is given by

$$\mu_t^* = \frac{(t-1)\mu_{t-1} + r_t}{t} = \frac{j + \alpha t^2 \mu_{t-1}}{1 + \alpha t^2}.$$
 (3)

Now, to find the appellate judge's expected utility from issuing a decision consistent with precedent, EU(maintain), we substitute  $r_t^*$  and  $\mu_t^*$  into the expected utility function. This yields

$$EU(\text{maintain}) = -\left[\left(\frac{j + \alpha t^2 \mu_{t-1}}{1 + \alpha t^2} - j\right)^2 + \frac{\sigma^2}{t}\right]$$
$$-\alpha \left[\mu_{t-1} - \left(\mu_{t-1} + \frac{t(j - \mu_{t-1})}{1 + \alpha t^2}\right)\right]^2,$$

which simplifies to

$$EU(\text{maintain}) = -\frac{\alpha t^2}{1 + \alpha t^2} (j - \mu_{t-1})^2 - \frac{\sigma^2}{t}.$$
 (4)

In our model the central benefit to appellate judges of maintaining precedent is informational. The more cases the trial judges have to refer to, the more accurately they will understand the legal rule for which that line of cases stands. Thus, the appellate judge wishes to maintain precedent because it makes communication with trial courts less noisy. However, the use of precedent comes at a price. In particular, appellate judges bear a cost for deviating substantively too far from the line of precedent that they claim to uphold. This constrains judges who are maintaining precedent from implementing a legal rule that matches their personal ideal, as can be seen in the model. When precedent is maintained,  $\mu_t^* = (j + \alpha t^2 \mu_{t-1})/(1 + \alpha t^2) \neq j$  (unless  $\alpha = 0$  or  $\mu_{t-1} = j$ ). The rule applied by the trial court when precedent is maintained is biased away from the current appellate judge's ideal point (i) in the direction of the old precedent  $(\mu_{t-1})$ . Further, it is interesting to note that the appellate judge, when maintaining precedent, chooses the holding  $r_{t}^{*} = \mu_{t-1} + [t(j - \mu_{t-1})/(1 + \alpha t^{2})],$ which is not equal to existing precedent  $(\mu_{t-1})$  or the appellate judge's ideal point (j) unless, by chance,  $j = \mu_{t-1}$  or  $t = 1 + \alpha t^2$ . This ruling is always in the direction of the appellate judge's ideal point, but may be more or less extreme, relative to existing precedent. If  $t > 1 + \alpha t^2$ , the appellate judge will issue a ruling farther from existing precedent than the appellate judge's ideal point. Otherwise, the appellate judge will issue a ruling between the ideal point and existing precedent.

While the appellate judge can make sure, by announcing a break with precedent, that the mean of the trial court's signal is equal to the appellate judge's ideal point, the variance of this signal (that is, the noisiness of communication) will be higher. Again, this can be seen clearly in the model, since  $\sigma^2 > \sigma^2/t$  as long as t > 1. The appellate judge thus faces a trade-off between the accuracy with which the legal rule is communicated to the trial courts and the proximity of that rule to the appellate judge's ideal. The appellate judge determines whether or not to break with precedent by comparing the expected utilities associated with each choice, breaking with precedent if and only if

$$EU(\text{break}) - EU(\text{maintain})$$

$$= \sigma^2 \frac{1 - t}{t} + \frac{\alpha t^2}{1 + \alpha t^2} (j - \mu_{t-1})^2 > 0$$

$$\Leftrightarrow \frac{\alpha t^3}{(t - 1)(1 + \alpha t^2)} (j - \mu_{t-1})^2 - \sigma^2 > 0.$$
(5)

#### The Trial Judge's Decision

The trial judge in this model is not a strategic actor. Rather, the trial judge simply follows the instructions of the appellate judge, aggregating all existing holdings in the line if precedent has been maintained but considering only the appellate judge's most recent ruling if precedent has been broken. Because the focus of our model is the appellate judge's decision, taking the trial judge's aggregation rule as given, we do not formally analyze the ramifications of strategic behavior by the trial judge. Nonetheless, because we justified this simplifying assumption in part by claiming that trial judges want to please their superiors on the appellate

bench or avoid being overturned on appeal, one might wonder if the trial judge would be better off attempting to deduce and implement the current appellate judge's ideal point, rather than following existing precedent. This turns out, however, not to be the case.

The trial judge could, of course, form an unbiased approximation of the appellate judge's ideal point by inverting the maximization problem that the appellate judge solved in equation (2), conditioning on the trial judge's estimate of preexisting precedent,  $\mu_{t-1}$ . That is, the trial judge could observe the signals associated with the first t-1 rulings in the line of precedent and use this information to estimate the precedent the current appellate judge faced. Then, conditioning on this preexisting precedent, the trial judge could invert the appellate judge's maximization problem to estimate what value of j would have caused the current appellate judge to issue the ruling the trial judge observed. This estimate is unbiased because the expected value of the trial judge's observation of any holding,  $r_i$ , in the line of precedent is  $r_i$ .

Notice, though, that the information regarding preexisting precedent can be used only to help the trial judge figure out what the current appellate judge's maximization problem was. Having done this, the only information the trial judge has regarding the appellate judge's ideal point is the signal that the trial judge observes, which is drawn from a normal distribution with mean equal to the current appellate judge's ruling,  $r_t^*$ . The variance of this distribution is  $\sigma^2$ , not  $\sigma^2/t$ . Consequently, following this inversion procedure cannot lead the trial judge to a better estimate of the appellate judge's ideal point than would be achieved if the appellate judge had simply broken with precedent and issued a ruling exactly at the appellate judge's ideal point. Indeed, because the trial judge approximates preexisting precedent with error, the estimate of j deduced from the inversion procedure is less precise than the estimate the trial judge would have formed if the appellate judge had broken with precedent.

The appellate judge maintains precedent only when the ruling of a trial judge who follows that precedent (that is, averages all the signals) will, in expectation, be closer to the appellate judge's ideal point than it would have been had the appellate judge broken with precedent. Since the trial judge's estimate of the appellate judge's ideal point formed by the inversion procedure is even worse than that produced by a break with precedent, the trial judge is more likely to please the appellate judge (and less likely to be overturned) by following precedent than by trying to deduce the appellate judge's ideal point. If this were not the case, the appellate judge would have broken with precedent. Thus, the trial judge would be better off acting as a faithful agent of the appellate judge, deciding cases according to precedent when instructed to do so.13

#### **RESULTS**

#### **Comparative Statics**

Comparative static analysis on the parameters of this model yields a number of results regarding how these parameters affect the relative desirability of maintaining or breaking with existing precedent.

It is clear from equation (5) that the desirability of breaking with precedent decreases as  $\sigma^2$ , the noisiness of each individual signal, increases. The intuition is that as communication between appellate and trial courts becomes less precise, the extra information provided by situating a decision in a line of precedent becomes more valuable to the appellate judge. Equation (5) also implies that increasing  $|j - \mu_{t-1}|$ , the distance between the appellate judge's ideal point and existing precedent, increases the attractiveness of breaking with precedent. Because a large distance between existing precedent and the appellate judge's ideal point constrains how much the appellate judge can move the expected trial court decision, the appellate judge is less willing to trade off control over the substantive rule for increased accuracy of transmission.

Equation (5) additionally shows that breaking with precedent becomes more attractive as  $\alpha$ , the marginal cost of making a substantively divergent decision within an existing line of precedent, increases. The reason for this is that, when  $\alpha$  is close to zero, the appellate judge can move  $\mu_t$  very close to j, even while maintaining precedent. Thus, the informational benefit of situating the current decision in a long line of cases comes at very little cost in terms of substance. However, as  $\alpha$  grows, the appellate judge's ability to move the legal rule close to j becomes more constrained, making adherence to existing precedent less attractive. One can see this by examining equation (3). Assuming that precedent is maintained, the distance that the legal rule will be moved is given by  $|\mu_t^* - \mu_{t-1}| =$  $|(j-\mu_{t-1})/(1+\alpha t^2)|$ , which is clearly decreasing

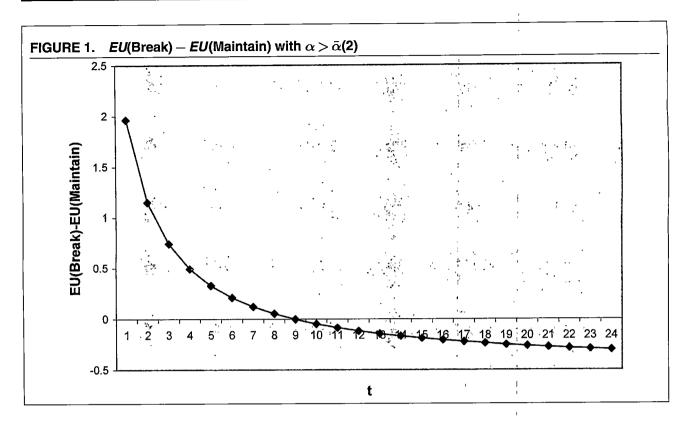

Deriving the comparative statics on t, the number of cases in the line of precedent, is more complicated. Because t is a discrete variable, to calculate the change in the attractiveness of breaking with precedent as the age of the precedent increases, we take the first differences of equation (5) with respect to t:

$$[EU_{t+1}(\text{break}) - EU_{t+1}(\text{maintain})] - [EU_{t}(\text{break}) - EU_{t}(\text{maintain})] \equiv FD(t) = -(j - \mu_{t-1})^{2}$$

$$\times \alpha \frac{\alpha t^{4} + 2\alpha t^{3} + \alpha t^{2} - 2t^{3} + 2t + 1}{(1 + \alpha t^{2} + 2\alpha t + \alpha)(1 + \alpha t^{2})t(t - 1)}.$$
(6)

 $<sup>^{12}</sup>$  This is possible only if the trial judge knows  $\alpha$  and  $\sigma^2$ . If not, the trial judge is unable even to entertain the possibility of trying to deduce the appellate judge's ideal point from the observed signals.  $^{13}$  This is not to say that an aggregation rule other than averaging might not lead to superior outcomes in some circumstances.

As discussed earlier, the optimal aggregation rule is a function of a host of complex institutional factors beyond the scope of this model. Nonetheless, the basic logic—that the appellate judge's choice to maintain precedent implies that the trial judge will do better by following precedent than by attempting to deduce the appellate judge's ideal point—holds under any aggregation rule

A little algebra demonstrates that this first difference can be positive or negative, depending on  $\alpha$  and t. In particular,

$$FD(t) < 0$$
 if  $\frac{2t^3 - 2t - 1}{t^4 + 2t^3 + t^2} \equiv \bar{\alpha}(t) < \alpha$ ,  
 $FD(t) > 0$  if  $\frac{2t^3 - 2t - 1}{t^4 + 2t^3 + t^2} \equiv \tilde{\alpha}(t) > \alpha$ . (7)

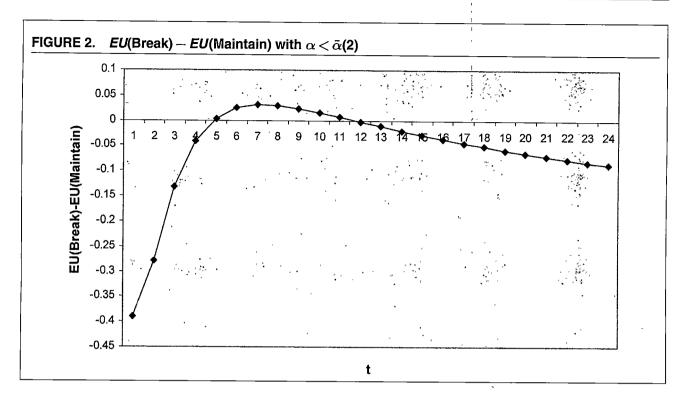

Increasing t decreases the desirability of breaking with precedent when  $\alpha > \bar{\alpha}(t)$ ; otherwise increasing t increases the desirability of breaking with precedent. It is important to note that this threshold,  $\bar{\alpha}(t) = (2t^3 - 2t - 1)/(t^4 + 2t^3 + t^2)$ , is itself a decreasing function of t. There are two cases to consider in understanding this result. The first is when  $\alpha > \bar{\alpha}(2)$ [the lowest possible values of  $\bar{\alpha}(t)$  when the appellate judge chooses to maintain existing precedent]. In this case, for all values of t, the attractiveness of breaking with precedent decreases as t increases. That is, for a sufficiently large  $\alpha$ , older precedents are always less vulnerable than younger precedents. This case is illustrated in Figure 1. If, however,  $\alpha < \bar{\alpha}(2)$ , then increases in t increase the attractiveness of breaking with precedent for a certain number of periods. Specifically, increases in t will increase the likelihood of breaking as long as  $\alpha$  is below the threshold value of  $\bar{\alpha}(t)$ . But as t increases, this threshold value decreases, meaning that  $\alpha$  will eventually be greater than the threshold. At that point, the effect of increasing t switches so that increases in t decrease the desirability of breaking with precedent. This case is illustrated in Figure 2.

To understand the intuition behind these comparative statics, recall that an increase in t has two effects on the desirability to the appellate judge of maintaining the line of precedent. On the one hand, an increase in t increases the constraint on how much the judge can move the substantive legal rule, making older precedents less attractive. On the other hand, an increase in t improves the accuracy with which the legal rule is communicated to the trial court, making older precedents more attractive. When  $\alpha$  is sufficiently high, the information effect always overwhelms the constraining effect. The reason for this is that when  $\alpha$  is high, the appellate judge's ability to move the legal rule is already so constrained that the marginal effect of an increase in t on this constraint is negligible. However, when  $\alpha$ and t are sufficiently low, the constraining effect of an increase in t is more important to the judge than the effect on information, thereby making an increase in t increase the attractiveness of breaking with precedent. As t increases further, the information effect of marginal increases in t will eventually overwhelm the constraining effects; no matter how low  $\alpha$  is, when t is sufficiently high the appellate judge is already so constrained that the marginal constraining effect of an increase in t is again negligible. 14

#### Limits of Legal Change

An interesting question in the context of our model is, How far on the substance dimension can a legal

<sup>&</sup>lt;sup>14</sup> Note also that as t goes to infinity, the appellate judge is completely constrained by the old precedent. In this case, the value of  $\alpha$  does not matter, and the payoff of an appellate judge who maintains precedent converges to  $-(j-\mu_{t-1})^2$ .

rule move without a judge ever claiming to have broken from precedent? Is this distance bounded or unbounded? That is, how far would precedent move if, over an infinite series of turns, each appellate judge's ideal point was such that that judge was exactly indifferent between moving existing precedent and breaking, leading these judges to move  $\mu_t$  as far from  $\mu_{t-1}$ as is possible—always in the same direction—without declaring a break from existing precedent? Returning to the tort liability example discussed earlier, imagine that over time appellate judges want a progressively stricter standard of care. We want to know whether it is possible for the standard of care to become infinitely more strict than the original standard announced by the first judge to consider the question, without any judge ever openly breaking with established precedent.

Of course, the idea that there are multiple appellate judges deciding cases in sequence implies a dynamic model, beyond the scope of this project. Nonetheless, our model does provide a framework that allows us to gain some theoretical leverage on this problem. If an appellate judge does not know what the ideal points of future judges will be, it is reasonable for the current judge to assume that the probability of a future judge having preferences any given distance to the left of existing precedent is the same as the probability of that judge having preferences the same distance to the right. Under such a symmetry assumption, the expected ideal point of a future judge lies at existing precedent. Consequently, the appellate judge's best guess of future precedent is current precedent, and so the decision problem in the dynamic model reduces to the one-shot problem analyzed above.15

Therefore, we can find the maximum distance the legal rule can move under these conditions (i.e.,  $\max |\mu_{\infty} - \mu_1|$ ) by solving the following constrained infinite sum:

$$\sum_{t=2}^{\infty} \{\mu_t^* - \mu_{t-1}\} = \sum_{t=2}^{\infty} \left\{ \frac{j + \alpha t^2 \mu_{t-1}}{1 + \alpha t^2} - \mu_{t-1} \right\}$$

$$= \sum_{t=2}^{\infty} \left\{ \frac{j - \mu_{t-1}}{1 + \alpha t^2} \right\},$$

$$s.t. \frac{(j - \mu_{t-1})^2 \alpha t^3}{(1 + \alpha t^2)(t - 1)} - \sigma^2 = 0.$$
(8)

By making the constraint an equality, we impose the condition that in each round the preferences of the appellate judge are such that the legal rule moves as far as is possible without the appellate judge preferring to break with precedent. Solving the constraint for  $(j - \mu_{t-1})$  and substituting, we find that the sum is equal to

$$\frac{\sigma}{\sqrt{\alpha}} \sum_{t=2}^{\infty} \frac{1}{t} \frac{\sqrt{t-1}}{\sqrt{t}\sqrt{1+\alpha t^2}}.$$
 (9)

Notice that if  $\alpha \neq 0$ , this can be bounded above as follows:

$$\frac{\sigma}{\sqrt{\alpha}} \sum_{t=2}^{\infty} \frac{1}{t} \frac{\sqrt{t-1}}{\sqrt{t}\sqrt{1+\alpha t^2}} < \frac{\sigma}{\sqrt{\alpha}} \sum_{t=2}^{\infty} \frac{1}{t} \frac{1}{\sqrt{\alpha t^2}}$$

$$= \frac{\sigma}{\alpha} \sum_{t=2}^{\infty} \frac{1}{t^2} = \left(\frac{\pi^2}{6} - 1\right) \frac{\sigma}{\alpha}.$$
 (10)

Thus, the distance that can be moved in one direction without a break from precedent is finite, even over

 $<sup>^{15}</sup>$  Of course, this is also the case if each appellate judge is myopic, caring only about the payoff in the current round.

an infinite number of turns. Specifically, the legal rule cannot move a distance greater than  $((\pi^2/6)-1)(\sigma/\alpha)$  from the decision in the first case in the line of precedent without at least one judge deciding to break. We can find comparative statics on the actual point of convergence by referring directly to equation (9). Notice that if  $\alpha$  is very small, so that judges are relatively unconstrained by the precedential line in which they are writing, this distance is quite large, whereas as  $\alpha$  gets large the distance shrinks. Similarly, as  $\sigma$  becomes large, the distance that can be moved gets larger because judges are willing to write opinions in line with precedent even when the substantive holdings of those decisions are very far away from the substantive position of the existing precedent.

#### **DISCUSSION**

#### **Resolution of Some Empirical Puzzles**

Our model provides a new perspective on when, why, and how judicial decisions are constrained by existing precedents. This perspective helps account for empirical observations of judicial behavior that are otherwise difficult to reconcile. To take a striking example, consider the role of deference to precedent in Supreme Court decision-making. On the one hand, a rigorous analysis of voting patterns on the Court finds that justices who vote against a "landmark" case—that is, a case that establishes an important precedent-tend not to switch their voting pattern in subsequent cases, even though the "landmark" case decision ought to constitute a legal precedent (Segal and Spaeth 1996a). This seems to be strong evidence that judges, at least at the Supreme Court level, do not feel constrained by legal precedents as such. On the other hand, if it is really the case that the justices do not attach much importance to precedent, then it is hard to explain why they devote so much time and intellectual energy to it in their deliberations and why they place so much emphasis on it in most of their decisions. Analysis of the U.S. Supreme Court decision-making process, after all, reveals that arguments from precedent vastly outnumber all other kinds of arguments in attorneys' written briefs, the Court's written opinions, and the justices' arguments in conference discussions (Knight and Epstein 1996; Phelps and Gates 1991). If it were really the case that judges cared about case outcomes rather than precedent, then all the emphasis on arguments from precedent would seem to be a waste of resources. But if precedent is really influencing justices' decisions, then the persistent patterns of continuous dissent from landmark decisions is difficult to explain.

Our model accounts straightforwardly for this seeming contradiction. Justices care about precedent precisely because they care about policy; if they can sufficiently improve their communication of the proper legal rule by integrating their decision with an existing line of cases, they will do so, even if it means somewhat modifying the legal rule they announce and expending some energy on writing a compelling and coher-

ent opinion that integrates seemingly divergent rulings. Thus, though our model does not formalize the process of formulating a judicial opinion, it is entirely consistent with the observation that judges put a lot of time and attention into trying to integrate their preferred outcome into an established line of cases.

However, in our model, if an appellate judge decides that the additional accuracy is not worth the sacrifice in terms of substantive policy, then the judge will vote to break with precedent. If a given judge dissents in a landmark case, therefore, that judge will usually continue to dissent in subsequent cases. After all, in our model judges do not care about precedent per se, so there is no reason for a judge to vote to uphold a legal rule that is far from that judge's ideal simply because that rule had been established in a prior case. An appellate judge will vote to adhere to precedent only if, in doing so, the legal rule can be moved sufficiently closer to the judge's ideal point that the gain in terms of accuracy is worth the cost in terms of substance.

A second apparent empirical anomaly that our model illuminates is the seemingly schizophrenic attitude of judges toward long-established precedents. On the one hand, many would quote approvingly Justice Holmes's (1897) quip that "it is revolting to have no better reason for a rule of law than that it was laid down in the time of Henry IV. It is still more revolting if the grounds upon which it was laid down have vanished long since, and the rule simply persists from blind imitation of the past." On the other hand, it is often thought that a legal rule with a long history is worthy of particular deference. Thus, lawyers and judges sometimes argue, implicitly or explicitly, against tampering with long-established legal rules even while disagreeing with their substantive content. Again, our model suggests a simple reconciliation of these apparently contradictory notions. Recall from the comparative statics that increasing t has two effects. It constrains the judge's ability to affect the substance of the legal rule, leading to the frustration embodied in Holmes's remark. However, an old precedent—i.e., a long line of cases though difficult to move, has a great deal of informational value. The consequence is that old precedents become entrenched so that even when judges disagree with the substantive rules they are reluctant to overrule them.

#### **New Hypotheses**

In addition to offering new insights into these important empirical puzzles, our model also suggests a number of new hypotheses regarding patterns of judicial decision-making. First, recall the comparative statics on the parameter  $\sigma$ , which measures the inherent difficulty in communication between appellate and trial judges. The model demonstrated that as  $\sigma$  increases, the attractiveness of breaking with precedent decreases. Substantively, this implies that areas of law that are highly complex and not amenable to simple legal regulation are more likely to develop long lines of cases, with both high levels of deference to precedent and evolution and

change of legal rules within the precedent. However, when the legal issue is simple, making communication of the legal rule less difficult, judges have little use for precedent. They will either follow the old rule exactly or change it completely.

Next, our model offers a new perspective on the long-standing debate about the relative merits of rules and standards (e.g., Kaplow 1992; Schlag 1985; Sullivan 1992). Typically, standards contain general principles for example, "due process" or "negligence"—whereas rules use more specific and precise language. Strict liability tort regimes and statutes of limitations are examples of such legal rules. In terms of our model, rulelike holdings might correspond to relatively higher values of  $\alpha$ , whereas standards might correspond to lower values of  $\alpha$  (recall that  $\alpha$  measures the costs to judges of effecting substantive legal changes while claiming consistency with an existing line of precedent). This is because it is easier for judges to adapt the broader, more general language of standards while claiming fidelity to the original principle than it is for judges to alter an unambiguous legal rule. As shown above, as  $\alpha$  increases the distance that a judge will move the substance of existing precedent while maintaining that precedent decreases, but as a result, the desirability of breaking with precedent increases. Thus, our model calls into question the conventional view that rules are more stable and predictable than standards. We find a trade-off between two types of stability. Rules will be associated with periods of little substantive change punctuated, more frequently, by sudden breaks. Standards, on the other hand, will be characterized by more constant, but gradual, substantive change but will be overturned outright less often. While we do not have a normative position regarding this trade-off, our model demonstrates that the question of whether rules or standards foster greater stability and predictability is more complex than is commonly appreciated.

Finally, our model suggests patterns that should emerge in the long-term evolution and development of law in an Anglo-American common law system. Recall that when  $\alpha$  is sufficiently low, legal rules are less vulnerable to being overruled when they are very young and when they are very old. A judge can easily adapt the substance of a young precedent to reflect personal policy preferences, making a break with precedent unnecessary. And, while a very old precedent strongly constrains a judge's ability to influence the substance of the law, it provides tremendous informational value. Middle-aged precedents are more vulnerable to being overruled. Thus, when  $\alpha$  is sufficiently low, we might expect the following pattern of legal development. When courts initially confront a new legal issue, the law will likely be characterized by a number of false starts. The legal rule specified by the first judge to confront the issue will be refined by a number of subsequent judges, but as the rule solidifies, it becomes more vulnerable to being overruled. This occurs because as the rule develops it may begin to exert a significant constraint on the decisions of judges before it can provide sufficient informational benefits to compensate for this constraining effect. Thus, we expect several rules to be proposed,

refined, and ultimately rejected. However, once a legal rule survives the precarious intermediate stage of its development, it will become increasingly entrenched, overturned only if it is confronted by a judge with substantially divergent preferences.

#### CONCLUSION

We have developed an informational model of judicial decision-making in which deference to precedent is useful to outcome-oriented appellate judges because it improves the accuracy with which they can communicate legal rules to trial judges. Although we believe that our model makes a significant contribution to understanding judicial decision-making, it is important to highlight that much work remains to be done in developing informational theories of judicial behavior. For example, while we have discussed a series of judicial decisions made over time, we have only modeled judges as one-shot decision-makers. A formal treatment of repeated decision-making might offer important insights, especially regarding the potentially moderating effect of the belief that one has multiple opportunities to effect changes in a substantive legal rule. Further, several possibilities exist for game-theoretic extensions of our simple decision-theoretic model. A particularly interesting avenue to explore would be a game with multiple appellate judges with diverse policy preferences. Another possibility is to model trial court judges as strategic actors with policy preferences of their own.

Nonetheless, our model yields interesting implications and hypotheses regarding conditions under which judges will maintain or break with precedent, the constraining effect that precedent has on judicial decision-making, the voting behavior of Supreme Court Justices, the relationship between a precedent's age and its authority, the effect of legal complexity on the level of deference to precedent, the relative stability of rules and standards, and long-term patterns of legal evolution. Perhaps most importantly, we have demonstrated that "legalist" features of judicial decision-making are consistent with an assumption of policy-oriented judges. Thus, the informational approach to the study of judicial behavior can generate new insights and help to reconcile long-standing debates in the literature.

# **Equal Votes, Equal Money: Court-Ordered Redistricting and Public Expenditures in the American States**

ourt-ordered redistricting in the mid-1960s eradicated severe disparities in the populations of U.S. state legislative districts. We examine the geographic distribution of money by states to counties. Cross-sectional analysis shows that counties with relatively more legislative seats per person prior to redistricting received relatively more transfers from the state per person. Over time, counties that lost legislative seats subsequently received a smaller share of state funds per capita. We calculate that population equalization significantly altered the flow of state transfers to counties, diverting approximately \$7 billion annually from formerly overrepresented to formerly underrepresented counties, an effect missed by past studies. For those concerned with the design of democratic institutions around the world today, the American experience provides clear evidence of the political consequences of unequal representation.

ourt-ordered redistricting in the 1960s radically altered representation in the United States. Through a series of important cases, beginning with Baker v. Carr in 1962, the U.S. Supreme Court established a criterion of strict equality of state legislative and U.S. House district populations. Prior to judicial intervention, unequal representation was the norm in U.S. legislatures, and in some states districts had extremely unequal populations. In 1960, the state legislative districts in only two states, New Hampshire and Wisconsin, approximated the one-person, onevote standard in both chambers (David and Eisenberg 1961). At the other extreme was the California state senate, with the smallest counties having 400 times as much representation as Los Angeles, the largest county in the state. Less than a decade after Baker v. Carr, every state in the country reshaped its legislative districts to comply with the Court's rulings.

Baker revolutionized representation and, we argue, fundamentally transformed the politics of public finance in the American states. Legal and legislative battles ended unequal representation in the state legislatures and the U.S. House by the close of the 1960s. We examine how political representation affected the distribution of state funds to counties in the United States from the 1950s through the 1980s.

Our interest in the consequences of *Baker* v. *Carr* derives from three broad problems for contemporary democracy. First, there is a persistent and nagging question for political scientists: Does representation matter? Do people benefit materially from having formal legislative representation? Some economists argue that

government policy responds to market forces rather than voters' interests, and some political scientists argue that the key determinants of public policy are the activities of interest groups or the state of public opinion, rather than formal political representation. Second, Can courts truly shape public policy or do their decisions merely reflect society's norms? Recent judicial scholarship argues that the courts have little direct impact on public policy in the United States. Early studies of the effects of redistricting, which show no effect of redistricting on public spending, are taken as a case in point (Carp and Stidham 1993; Rosenberg 1991). Third, around the world today many democratic governments are forming and reforming, and many nations have created legislatures with highly unequal representation of the populations. Among comparative political scientists and development economists there is growing concern that unequal political representation produces unequal distribution of public money in a variety of federal systems, though there are few unambiguous estimates of the effects of malapportionment on the distribution of public expenditures (Gibson, Calvo, and Falleti 1999; Samuels and Snyder 2000). We view Baker v. Carr and the resulting reapportionment of the American state legislatures as an important natural experiment with which to address these questions.

At the time of the *Baker* decision it was widely thought that equalization of representation would lead directly to equalization of public expenditures on highways, schools, and other important public programs. Gaining their "fair share" of public funding was, in fact, a central motivation of the plaintiffs in *Baker* v. *Carr*. The Intervening Petition to the District Court in *Baker*, filed by Mayor Ben West of Nashville, provides extensive statistical data showing "the direct relationship between excess representation in the unlawfully constituted General Assembly of Tennessee and the obtaining of an excess share in the monies collected by the State of Tennessee . . . and the converse, the direct relationship between the lack of proportionate

representation in the General Assembly and the bearing of an excessive and disproportionate share of the expense of government."<sup>1</sup>

Despite these strong expectations, social science research to date provides at most only weak support for the conclusion that equalizing state legislative representation altered policy outcomes. Research published in the late 1960s and early 1970s probed the relationship between state-level measures of unequal representation prior to Baker and statewide levels of public expenditures on a variety of programs. On the whole, these studies found no or slight effects of unequal district populations on public spending overall or on specific programs.<sup>2</sup> Studies examining changes in state expenditures in the years immediately after redistricting found some effects, but typically the results were mixed and the methods problematic (Fredrickson and Cho 1970; Hanson and Crew 1973; Pulsipher and Weatherby 1968). Nearly 40 years after Baker, the conventional wisdom among legal scholars and political scientists is that court-ordered equalization of legislative district populations had little if any effect on how states allocate public funds (Carp and Stidham 1993, 370; Rosenberg 1991, 292-303).

Could the immense change in representation that occurred in the American states from 1962 to 1972 have had large and demonstrable effects that were overlooked in previous research or obscured by methodological problems? Early research implicitly assumed that the effect of malapportionment would be reflected primarily in *levels* of spending, overall or on specific programs. We study how one-person, one-vote changed the *distribution* of state spending as it changed the distribution of seats to geographic areas.

We investigate perhaps the simplest hypothesis about the effect of redistricting: When a geographic area gets more power it will receive a greater share of state money. We know of no previous study that has looked directly for such redistribution. We examine both the cross-sectional relationship between each county's representation and its share of state transfers and the change in each county's share of state transfers that occurs following redistricting. We find strong and consistent evidence in support of this hypothesis.

#### DATA AND METHODS

We analyze the distribution of state money to and the political representation of the 3,155 U.S. counties. Counties are the basic unit of analysis in this study for three reasons. First, state governments report their electoral and government finance data at the county level. Reports of electoral and finance data are available at other levels, such as cities, but county data are much more complete. Second, counties have very stable boundaries that are determined exogenously to the districting process. We can, therefore, measure changes in the dependent and independent variables over time for these units. Using political units, such as legislative districts, creates potential endogeneity problems because the legislatures determine these boundaries and make the revenue decisions. Third, there was ample variation in the political strength of counties prior to court-ordered redistricting.

#### **Measuring Representation**

Our primary independent variable of interest is the representation of individuals in the state legislatures. We measured this at the county level by calculating the number of legislative seats per person in each county. Because the sizes of legislatures and populations vary across states, any measure of voting power that is to be compared nationwide must be converted to a common metric. Following David and Eisenberg (1961), we measure the number of legislative seats per person in a county relative to the number of seats per person in a given state. When a county is split across more than one district the index equals the weighted average of the representation of the various parts of the county. We call this the Relative Representation Index (RRI).<sup>4</sup> A county with an index value equal to 1 has representation equal to the ratio one would expect under an exact one-person, one-vote rule. Values <1 reflect underrepresentation and values >1 indicate overrepresentation.

An example helps with the interpretation of the index. Suppose that a state has 40 legislative districts and 2,000,000 people; thus, there are, on average two seats for 100,000 people. The denominator of the index, then, is 2/100,000. If a county contains three legislative districts and 100,000 people, the numerator of the index equals 3/100,000. The county in question, thus, has 50% more representation than the typical county in the state, for an index value of 1.5.

Following David and Eisenberg, the RRI for a state's entire legislature is the average of the index for the upper and lower chambers. For the legislative district lines in the 1950s and early 1960s, we rely on David and Eisenberg's measurement of this index. By 1972, populations of state legislative districts were nearly equal in every state (*Book of the States, 1972–1973*, 64, 65). Throughout, we treat the RRI as equal to 1 after 1972.

In 1960, the disparities in county representation in state legislatures were substantial. For the lower houses, the mean of the RRI was 1.65, indicating that

We are grateful to Harris Gilbert, attorney for the city of Nashville in the *Baker* suit, for providing these materials.

<sup>&</sup>lt;sup>3</sup> For other statements to this effect, see, for instance, Erikson 1973, 280, and McCubbins and Schwartz 1988, 388. Analysis of malaportionment arising from representation of states in the U.S. Senate produces additionally ambiguous results. Atlas et al. (1995) find effects of underrepresentation in the Senate, but Lee (1998) finds substantively small and statistically weak effects.

David and Eisenberg (1961) use the term "Right-To-Vote Index."

the average county had about 65% more representation than it would have had if its share of the legislature equaled its share of the state population. The average within-state standard deviation in the RRI was 1.23. For the upper houses, the average value of the RRI was also 1.65. The average within-state standard deviation was 1.47. After establishing the one-person, one-vote standard, the Court allowed deviations from equal population of no more than several percent. In an ideal world, this would make the RRI equal to 1 in all counties; the mean would then be 1 and the standard deviation would be 0.

Unequal legislative district populations prior to the 1960s tended to reflect urban-rural divisions, but this is only part of the story. The correlation between the RRI (in logarithms) and the county population (in logarithms) is -.58. In 20 states, the correlation is above -.9. However, suburban counties were often as poorly represented as urban counties. In New York state, Nassau, Suffolk, and Westchester counties were more underrepresented than New York City. In Illinois, Lake and Dupage counties had less representation than Cook County (Chicago). In Maryland, the City of Baltimore had three times as many legislative seats per person as neighboring Baltimore County. Some rural counties were also badly underrepresented in some states. Tennessee, for example, gave fewer legislative seats per capita to rural counties in the eastern half of the state. Because urban residents tend to vote Democratic and suburbanites tend to vote Republican, the expansion of the franchise often had uneven effects on the partisan composition of state legislatures (see also Erikson 1973).

The exceptions to the underrepresentation of metropolitan areas deserve mention for a methodological reason. Noting the underrepresentation of urban areas, some studies have examined the *level* of state expenditures on "urban" programs, or total state intergovernmental transfers to the largest urban counties, using the states as the units of observation (Brady and Edmonds 1967; Fredrickson and Cho 1970). This approach introduces a large amount of measurement error, because "urbanness" is an imperfect measure of "underrepresentation," especially when the data are aggregated to the state level. As a result these studies probably yield biased estimates.

#### Measuring Public Expenditures

We seek to explain the distribution of public money to counties. The Census of Governments is conducted every 5 years; we use data from 1957, 1962, 1967, 1972, 1977, and 1982. We focus on the first two and last two years in this series. The years 1957 and 1962 depict expenditures before *Baker*. Battles over equalization of district populations occurred mainly from 1962 through 1968. Because of lags in districting, budgeting, and legislative organization, it is difficult to pinpoint when changes in representation should have begun to affect transfers. Transfers to counties in 1977 and 1982, thus, measure the distribution of expenditures

once one-person, one-vote was in place. To smooth year-to-year variations in expenditures, we average the 1957 and 1962 reports and the 1977 and 1982 reports. Our findings are the same when analyzing each year separately.

We study total transfers from states to all local governments within counties. Though certainly not all state money, these transfers account for a large share of state expenditures: 35 to 38% of all money in this time frame. Roughly half of all money transferred to local governments was for education, one-fifth was for highways and roads, and one-sixth was for general aid to local governments.<sup>5</sup>

Our motivations for examining this variable are threefold. First, this is the variable used in much past research on this topic. Using this variable aggregated to the state level, researchers found no effects of reapportionment. Second, the geographic distribution of transfers is readily identified. It is very hard to determine the geographic distribution of the remaining 60% of state expenditures. Third, total state transfers to counties cumulate a large number of programs and, we expect, should reflect the influence of legislators on public finances generally. Measuring the effects of representation on isolated programs may be problematic if there is vote trading or logrolling across programs.

There is one important detail regarding our main dependent variable. State intergovernmental transfers to local government are not composed entirely of money that originates inside the state, but include some federal "pass-through" money—funds sent from federal accounts to the states that are then transferred to local governments. This is an accounting issue and practices vary from state to state. In only a few states are federal pass-throughs greater than 15% of the total state intergovernmental transfers. When we exclude these states from our analysis the results are unchanged.

Transfers from states to counties varied considerably across states and over time. State transfers to counties in 1962 averaged \$71 per person, with a standard deviation of \$40. State transfers to counties in 1977 averaged \$128, with a standard deviation of \$58. To compare these figures across states, we calculate each county's share of per capita transfers, divide the total transferred to each county by the county's population, and then divide this by the average per capita amount transferred to counties in the state. This is analogous to the definition of the RRI.

As we would expect if one-person, one-vote affected public finances, some degree of equalization of transfers occurred over the span of our study. If every county got its "fair share," then the counties' shares of per

<sup>&</sup>lt;sup>5</sup> For more details on the composition of intergovernmental transfers see the U.S. Bureau of the Census, *Census of Governments*, vol. 6, *State Payments to Local Governments*, various years.

<sup>&</sup>lt;sup>6</sup> In all states, pass-throughs include some portion of federal spending on Title I aid to education, school lunch programs, and adult and vocational education. In some states, pass-throughs also include funds for hospital construction and local health services, disaster relief, airports, and forest reserve payments. See the U.S. Bureau of the Census, Census of Governments vol. 6, State Payments to Local Governments, various years.

capita transfers from the states would be exactly equal to 1. From the 1950s to the 1970s, both the mean and the variance of counties' shares of per capita transfers shrank. The average relative per capita expenditures in 1957 and 1962 equal 1.25, and the variance around this average is .17. The average relative per capita expenditure in 1972 and 1977 equals 1.06, and the variance around this average is .09. In other words, in the wake of the redistricting cases of the 1960s, the transfers to the typical county more closely approximated the equal division of funds (with a mean near 1), and disparities across counties were cut in half (the approximate reduction in the variance).

#### Other Factors

In addition to our measure of county representation, many other variables might affect the distribution of public money. We address this in three ways.

First, we include variables for demographic, socioeconomic, and political factors. To minimize the danger of omitted variable bias we include the poverty and unemployment rates, median income, percentages of the population that are school-aged, black, and elderly, and population change (growth). Poverty and income are included because many state spending programs transfer money to low-income citizens. Unemployment rates are included because some state funds pay for shortterm relief. The school-aged population is an important predictor of transfers because approximately half of all money transferred from states to locales is for education. Black and elderly populations are often targeted for assistance. Population change captures lags in the adjustment of the budget process to demographic shifts and the consequent depression of per capita transfers in fast-growing counties.

Political factors, in addition to representation, may affect the distribution of state money, including county voter turnout and partisanship, party control of the legislature and governorship, and the relative power of the governor versus the legislature. Counties with high turnout rates may be expected to receive more state money, because for state-level elected officials (such as the governor) the political rewards to providing public goods to counties with higher turnout rates will be greater, other things equal (Husted and Kenny 1997). We measure county partisanship by county gubernatorial vote. State-level fixed effects capture political control of the overall state government. We further consider whether partisanship of the electorate interacts with party control of the state legislature or the party of the governor to capture the possibility that politicians favor those counties with more agreeable partisan leanings.<sup>7</sup>

Second, we regress the change in each county's share of state transfers on the change in the county's representation. This eliminates the influence of any omitted variables that are approximately constant over time.

Finally, we include dummy variables for each state in all model specifications. In our cross-sectional regressions, inclusion of state-level dummy variables eliminates the need to include any additional variables that are restricted to the value 0 or 1, such as variables for region of the country or "democratic majority in the state legislature." When we regress the change in a county's share of state transfers on the change in that county's representation, including a dummy variable for each state captures the effect of any contemporaneous changes in state-level variables, such as the state's adoption of the line item veto or a change in majority party control of the state legislature. Table 1 presents the variables used in the analysis.

## REPRESENTATION AND THE DISTRIBUTION OF FUNDS WITHIN STATES

Our analysis of the effects of representation on spending breaks neatly into two empirical questions. First, did counties with relatively more legislative seats per person prior to 1962 receive relatively more money per person? We address this question by examining the relationship between representation and transfers across counties in 1960. Second, did equalization of voting strength produce a more equal distribution of state transfers per person to counties? We address this question by examining the relationship between representation and transfers across counties in the 1980s and by examining changes in transfers and representation over this 20-year period.

#### **Differences Across Counties**

Immediately before the Court imposed one-person, one-vote on the state legislatures, there was a strong positive relationship between legislative seats per person and state intergovernmental transfers per person. Figure 1 displays the relationship between revenue shares and vote shares (both in logarithms) for the national sample. We convert the revenue and vote measures to logarithms to reduce the heavy skew in these measures, making the relationships between the transformed variables nearly linear.

Controlling for other factors, the estimated effect of representation on the distribution of public expenditures is very large and highly significant. Table 2 reports regressions predicting counties' relative shares of state transfers controlling for political and demographic factors. The estimates in Table 2 confirm that unequal district populations correspond with substantial inequalities in the shares of funds in the 1960s. The coefficient on the RRI is .34 (SE=.01) without any control variables. Controlling for other demographic and political factors, the coefficient on relative representation is .17 (SE=.01). Other things equal, doubling a county's representation is predicted to increase its share of state money by almost 20%, a substantial effect on its share of state revenue.

<sup>&</sup>lt;sup>7</sup> An extensive literature investigates partisan and ideological effects on budgeting at both the federal and the state levels, with mixed findings. See, for example, Dye 1984, Plotnick and Winters 1985, and Erikson, Wright, and McIver 1989.

The effects of the control variables in the regression generally square with our intuitions regarding the ideological commitment to redistribution associated with the New Deal and Great Society and arguments from the public finance literature about government spending. Areas with higher poverty rates and lower median income received substantially more state revenue per person. More money flowed to areas with higher unemployment rates. Counties with more persons in school received more state money, though there was no significant effect of high percentages of old or black citizens. Consistent with the possibility that budgeting lags population growth, areas experiencing faster population growth receive less per capita state transfers. With the exception of the variable for county turnout, the political controls have no important effect. Consistent with Husted and Kenny (1997) and Stromberg (1999), counties with relatively high turnout in statewide elections received relatively more revenue per person.

Analysis of the distribution of funds two decades after *Baker* serves as a check that the result for 1960 is not spurious. By 1980, after district populations had been equalized, the RRI in 1960 should have little or no

effect on the distribution of revenues. Figure 2 parallels Figure 1, but for 1980.

Regressions of 1980 transfer levels on 1960 RRI shows that RRI is, at most, only weakly correlated with enduring county-level differences associated with the distribution of state funds. A regression parallel to that in Table 2 for 1980 yields a coefficient on the 1960 RRI of .04, with a standard error of .01. The residual effect might reflect the persistence of agrarian legislators in positions of power in many state legislators. By 1972, all state legislative districts were in compliance with the one-person, one-vote standard.

Considering regional differences in American politics, we examined whether the patterns we detected nationally also held within the South by rerunning the regressions reported in Table 2 separately for the Southern and non-Southern states. Regional variation did not prove substantively important. We also examined whether the percentage black in a county altered the relationship between RRI and transfers, and we found no interaction effect.

The key result from the cross sectional analysis, then, is that counties that had less representation received relatively less money during the pre-Baker era. The

#### Changes from 1960 to 1980

Cross-sectional analysis, even when control variables are included, can generate spurious results due to

omitted variables. One possible critique of our crosssectional analysis is that malapportionment merely reflected a county's political power, rather than causing it. If so, some common feature might have led a county to have both overrepresentation in the legislature and a large share of the state's transfers. To minimize the chances that omitted variables led to incorrect inferences about the effect of districting, we next look at how revenue to a county changed over time in response to a change in the county's voting power. District populations were equalized in a very short period of time—from 1962 to 1968. If political representation influenced the distribution of public finances, then counties, especially those extremely over- or underrepresented, should have witnessed substantial changes in the revenues per person that they received from the state, relative to the amounts other counties received.

Increases in a county's representation did in fact produce dramatic increases in revenues per person. Table 3 presents regression results from an analysis predicting changes in revenue shares from 1960 to 1980. The estimated coefficient on  $-\log(RRI)$  in the multivariate regression reported in Table 3 equals .16 (SE = .01). Controlling for other factors, doubling a county's representation increases its revenues per capita by 16%. This effect is nearly identical to the cross-sectional estimates we report in Table 2, as expected if the cross-sectional results are not spurious. The effects of the control variables are, again, generally consistent with our expectations and with the results reported in Table 2. We also tested for possible interactions among our representation index region, levels of government

spending, and other demographics, but no interaction effects emerged.<sup>8</sup>

The racial composition of the counties captures another facet of representation. At the time of the reapportionment cases, legal and legislative actions sought

to increase representation of blacks through the districting process. The results in Table 3 reveal that, over time, counties with increasing black populations showed substantial gains in their shares of transfers from the state. Of course, this effect reflects changes in social attitudes and policies as well as changes in redistricting practices. One possibility is that our estimate of the effect of reapportionment reflects mainly the gain among black counties. It does not. We test for such a possibility by interacting percent black with RRI in the regressions. The coefficient on the interaction is very small and statistically insignificant. In other

<sup>&</sup>lt;sup>8</sup> We also tested for the influence of federal spending improperly included in the state transfer totals. We created dummy variables identifying states that were large recipients of federal funds in 1960 or enjoyed large increases in federal funds over the period covered by the study. The effect of the RRI on transfers was the same for those states with high versus low initial levels of federal spending and high versus low levels of growth in federal spending.

words, underrepresented black and white counties gained equally from reapportionment.<sup>9</sup>

The estimates in Table 3 are remarkably robust on a state-by-state basis. <sup>10</sup> In bivariate regressions of the effect of the RRI on county transfers state by state, the median state coefficient estimate was -.19, with 50% of the state-level regressions producing values between -.11 and -.41. In only four cases was the coefficient negative. In only one case (South Carolina) was the estimate statistically significant; the remaining three cases (North Dakota, Oregon, and Washington) were among the least malapportioned states pre-Baker.

To test the robustness of the results further, we exclude the major urban areas. Cities tended to gain seats following redistricting, and the 1960s witnessed greater public attention to the problems of urban areas. We ran the regressions reported in Table 3, after excluding the 100 counties with the largest 1960 populations, counties with at least 300,000 people. The estimated coefficient on the RRI is .21 in the bivariate regression and .15 in the multivariate regression; neither is statistically different from the coefficients reported in Table 3. Changes in state transfers tracked changes in political power even among suburban and rural areas.

Finally, we examine whether political institutions distort the effect of representation on public finances. A large literature examines the effects of political institutions on public finances, including fiscal centralization, relative power of the legislature and the governor, power within the legislature, divided government, and popular control over the legislative processes.<sup>11</sup> Our analyses implicitly hold constant the direct effects of these institutional factors through fixed effects for states and, in Table 3, for each county. We also explored whether any of these institutional factors interact with the representation index, magnifying or shrinking the effects of malapportionment on the distribution of public funds.<sup>12</sup> With one exception, fiscal centralization, none of these factors proved to interact with the RRI. A county's per capita share of the legislative seats (RRI)

had a large and positive effect on the distribution of transfers in both fiscally centralized and decentralized states, though the effect of the RRI was somewhat smaller in more centralized states. We are unsure if this is a real effect. One possibility is that this interaction itself reflects malapportionment, as voters in highly malapportioned states may have trusted the state legislature less and kept more control over public finances locally.

Overall, the findings reveal that representation directly affects the distribution of public spending. Institutional and demographic factors do not mediate the effect.

### Effects on the Level of Overall State Transfers

Equalization of legislative district populations in the mid-1960s may have affected the level of spending, in addition to altering the distribution of public expenditures. Transfers from states to counties grew from \$365 per person in 1960 to \$659 per person in 1980 (in 1999 dollars). One might expect Baker to have contributed to an expansion of state government in the 1960s and 1970s for three reasons. First, underrepresented areas may have had a higher demand for public expenditures than overrepresented areas. Underrepresented areas typically had a higher per capita income, and demand for public spending tends to increase with income. Second, expanding the size of government may have been politically more expedient than cutting programs that benefited voters who had been overrepresented in the past. Third, expansions of democracy have generally been associated with expansions in government spending, as new voters bring new demands for public expenditures (e.g., Husted and Kenny 1997; Lindert 1996).

Most prior research on the effects of malapportionment examined its effects on *levels* of spending, overall and on particular programs. Table 4 presents estimates of the association between changes in a state's overall degree of malapportionment and the growth in total state transfers to counties. As noted earlier there are many ways to measure state-level equality of representation. We considered three: the mean of the log of RRI, the standard deviation of the log of RRI, and the difference in the log of RRI between the county with the most representation and the county with the least representation (labeled the RRI range). We regressed the change in the log of total intrastate transfers to counties on the various state-level measures of malapportionment.

<sup>&</sup>lt;sup>9</sup> Looking more closely at the data indicates why. Population and percent urban are by far the strongest predictors of the RRI index. The racial composition and party composition of counties explain very little of the variation in the RRI index. This says nothing about the distribution of funds *within* counties, which might have been affected by racial politics.

<sup>&</sup>lt;sup>10</sup> Previous scholars have noted that, when states are pooled together in an aggregate analysis, important differences across states might be obscured even when state dummy variables are included (Stein 1982).
<sup>11</sup> Garand (1988) surveys a range of institutional factors affecting growth of government spending. Stephans and Olson (1979) and Rich (1989) survey a range of factors that affect federal aid. Abney and Lauth (1997) discuss the relative power of the governor, with specific emphasis on line item vetoes. On the role of political parties, see Levitt and Snyder (1995). On power within legislatures, see Ritt (1976).

<sup>12</sup> Our measure of fiscal centralization was the share of state and local government expenditures or revenues accounted for by the state. Our measures of governor power included the presence of a line item veto, appointment power, budgetary power, and overall power. Our measures of popular control was whether the state had initiatives and referenda and whether the state had an open meeting law. We interacted each of the variables with the RRI in the cross-sectional and over-time specifications.

 $<sup>^{13}</sup>$  Using data from the Statistical Abstract, we calculated the share of combined state and local revenues that originated at the state level and then created a variable equal to 1 for counties in states that were more centralized than the median and -1 otherwise. We then interacted this variable with the RRI. We reran the regression model in Table 3, column 3, including the new interaction variable. The effect of the RRI remained .16 (SE=.01), and the coefficient estimate for the new variable was -.04 (SE=.01). Similar findings are obtained when the centralization measure is based on spending rather than revenue.

Consistent with past research we find that equalization contributed little to the growth of transfers from state governments to counties. All three state-level measures of malapportionment predict positive correlations with total state transfers per capita to all counties in a state from 1960 to 1980. However, none of the coefficients of interest reach conventional levels of statistical significance. And the effects are substantively very small: A one-standard deviation change in one of these measures predicts only a 3 to 4% growth in total revenue per capita transfers.<sup>14</sup>

#### WHAT IF CARR HAD WON?

Our findings clearly show that representation affects the distribution of public funds. Using the regression estimates, we can investigate an important counterfactual. Had the Court not imposed one-person, onevote, what would the distribution of state revenues have looked like in 1980, the end point of our study?

Without the Court's action a, high degree of malapportionment would likely have existed in 1980, and even today. State legislatures created most of the malapportionment that existed in the 1960s through inaction, leaving in place district boundaries that were created at the end of the nineteenth century or the beginning of the twentieth century (Dixon 1968). Had the 1960 apportionment held in 1980, gross discrepancies in district populations would have existed in 1980, the end point of our analysis. The 300 most over represented counties in 1960 contained 5.3 million people by the 1980 census. The 300 most under represented counties in 1960 contained 85.1 million people by the 1980 census.

What would the distribution of public expenditures have been had this degree of malapportionment existed in 1980? We construct the counterfactual using predicted values from the regressions presented in the previous section. Algebraic manipulation of the regression

specification produces a simple formula for calculating how much per capita state revenues in 1980 differed from what would have been had the county representation remained as unequal as it was in 1960.<sup>15</sup>

The amount of redistribution that followed from *Baker* was substantial. In the most underrepresented counties, the lowest 5% in terms of RRI, equal votes increased state revenues by \$90 per person per year. In the most overrepresented counties, equalization of state legislative populations reduced revenues transferred from the state by \$270 per person per year. The cumulative effect was to shift approximately \$7 billion annually toward counties that had been underrepresented prior to the imposition of one-person, one-vote. <sup>16</sup>

#### DISCUSSION

Baker v. Carr exposed an age-old and fundamental flaw in the design of constitutional democracy—a flaw

<sup>&</sup>lt;sup>14</sup> The standard deviations of the average of the logarithm of the RRI and of the standard deviation of the logarithm of the RRI are approximately .2 and the standard deviation of the hi-to-lo log RRI is .88.

<sup>&</sup>lt;sup>15</sup> The difference between the predicted state revenues per capita in a county had the 1960 distribution of votes held and the predicted state revenues under the 1980 district lines equals  $Y^* - Y_{80} = Y_{80}[(RRI_{60})^2 - 1]$ , where  $Y^*$  is the hypothetical level of per capita spending in a county if the 1960 districting held,  $Y_{80}$  is the actual level of per capita state spending in the county, RRI<sub>60</sub> is the RRI measure for the county in 1960, and .2 is the elasticity from Table 3. We make one simplifying assumption in making this calculation: Equal voting power did not contribute to the growth in overall state transfers to counties, which seems reasonable from the section Effects on the Level of Overall State Transfer.

<sup>&</sup>lt;sup>16</sup> The very small standard errors for the RRI coefficient imply that the prediction standard errors are very small. To calculate the amount of redistribution we computed the amount gained by those who would have been underrepresented had Carr won. The 150 counties with the lowest RRI (bottom 5% of the distribution) had an average RRI of .49 and contained 62 million people. The difference between the predicted and the actual per capita transfers  $(Y^* - Y_{80})$  equaled \$87.62, which implies that these counties gained a total of \$5.36 billion annually. The 150 counties with the next lowest RRI (fifth to tenth percentile) had an average RRI of .72 and a total population of 24 million people. The difference between the predicted and the actual transfers equaled \$41.91, and the total equaled \$1 billion annually. The remaining underrepresented counties (between the tenth, and the twenty-fifth percentile) had an average RRI of .94 and 72 million people. The average predicted difference in per capita transfers equaled \$8.10, and the total equaled \$600 million annually.

elegantly described by John Locke (1960, 419) in the Second Treatise of Government:

... We may be satisfied when we see the bare Name of a Town, of which there remains not so much Housing as a Sheep-coat; or more inhabitants than a Shepherd is to be found, sends as many Representatives to the grand Assembly of Law-makers, as a whole County numerous in People, and powerful in riches. This Strangers stand amazed at, and every one must confess needs a remedy. Though most think it hard to find one, because the Constitution of the Legislative being the original and supreme act of the Society... no inferior Power can alter it.

In the United States, the Supreme Court imposed on the state legislatures a solution to the American version of the problem of "rotten boroughs." The Court's power in this situation is beyond doubt. The doctrine of one-person, one-vote transformed political representation in the United States. Within six years of the *Baker* ruling, nearly every state legislature was in compliance with the principle of one-person, one-vote.

Equally clear is the value of representation. Within 15 years of the *Baker* ruling, the doctrine of one-person, one-vote resulted in a substantial *equalization* of the distribution of public funds within states. This conclusion shifts the focus of research on the value of representation. Prior research has examined mainly the effects of representation on *levels* of spending, overall or on specific programs. The conclusion from such studies has been that unequal representation by and large does not effect levels of public spending, a conclusion that apparently questions the very value of political representation. That conclusion may be right, but it misses the true effect of representation on public spending. Representation affects the distribution of funds—who gets what—rather than how much government spends.

The reapportionment revolution in the 1960s also carries a very important insight about political power within legislatures. Many political scientists analyze and interpret legislative politics as bargaining among equals—the individual legislators. An alternative view treats distributive politics as bargaining among predetermined voting blocs or interests that may be quite unequal in strength. Indeed, many scholars and politicians have defended overrepresentation of rural areas as necessary to prevent the large urban areas from dominating the state legislatures: an urban bloc will take more than its "fair share" of public expenditures (see, e.g., Perrin 1962 and de Grazia 1962, chap. 5). Our findings strongly support the notion that distributive politics consists of bargaining among equals. We document that the overrepresented areas, which were primarily rural, received more than their fair share of public expenditures in the decades before the imposition of one-person, one-vote. In the decades following Baker, urban blocs did not dominate state legislatures' budgeting decisions. Rather counties have received shares of the public expenditure in proportion to their per capita representation. Equal votes produced equal distributions of money.

In the world today, questions of political representation are no less pressing than 40 years ago. Malap-

portionment is widely observed. It is the norm in federal systems, and it is common among emerging democracies (Samuels and Snyder 2000). For those concerned with the design of representative institutions, the American experience provides a clear and simple lesson. Apportionment of legislative seats determines the distribution of political power in legislatures and the resulting allocation of government resources.

# Speak Softly and Carry a Big Stick? Veterans in the Political Elite and the American Use of Force

CHRISTOPHER GELPI AND PETER D. FEAVER Duke University

ther research has shown (1) that civilians and the military differ in their views about when and how to use military force; (2) that the opinions of veterans track more closely with military officers than with civilians who never served in the military; and (3) that U.S. civil-military relations shaped Cold War policy debates. We assess whether this opinion gap "matters" for the actual conduct of American foreign policy. We examine the impact of the presence of veterans in the U.S. political elite on the propensity to initiate and escalate militarized interstate disputes between 1816 and 1992. As the percentage of veterans serving in the executive branch and the legislature increases, the probability that the United States will initiate militarized disputes declines. Once a dispute has been initiated, however, the higher the proportion of veterans, the greater the level of force the United States will use in the dispute.

...My feeling is that [National Security Advisor Anthony Lake] must always be conscious when it comes to making military decisions on the use of military power that the president has not served and that he has not served.

General John Shalikashvili, Chairman of the Joint Chiefs of Staff (as quoted in DeParle 1995)

n his autobiography, General Colin Powell relates his difficulty in dealing with the academic and "nonmilitary" style of the Clinton foreign policy team. He describes his patient efforts early in President Clinton's first term to instruct civilian leaders on when and how to use force. During one such session, Madeleine Albright, then ambassador to the UN and later Secretary of State, asked General Powell in frustration, "What is the point of having this superb military that you're always talking about if we can't use it?" Powell reports that he thought he "would have an aneurysm. American GIs were not toy soldiers to be moved around on some sort of global game board" (Powell and Persico 1995, 576–77).

It is tempting to dismiss the Powell–Albright exchange as merely a *contretemps* between two powerful and idiosyncratic personalities. But nearly every post-Cold War use of U.S. military force was conducted against the backdrop of some sort of civil–military dispute, and these disputes in broad brush seemed to conform to the Powell–Albright pattern: Civilian leaders seemed more willing than military leaders to deploy the military in Bosnia, Somalia, Haiti, Rwanda, Kosovo, and so on (Desch 1999; Feaver n.d.). Of course, exceptions abound, with some prominent civilian politicians showing reluctance and some prominent military

officers showing a greater willingness in a given case (Avant 1996/97). At the most senior policymaking levels, the civil-military distinction is blurry and only awkwardly fits the neat categories of classical civil-military relations theory (Roman and Tarr 2001). Nevertheless, reports persist that post-Cold War civil-military relations in the United States are characterized by repeated clashes between promiscuous civilians and reluctant warriors (Mandelbaum 1996; Weigley 2001).

We examine the extent to which these disputes are a function of an enduring civil-military gap. Other research has shown that military experience "matters" in the sense that civilians and military personnel tend to give different responses on surveys asking about the appropriate criteria for when and how to use force. Moreover, this research has indicated that civilians who are military veterans give responses that track more closely with those of military officers than with those of civilians who never served (Feaver and Gelpi 1999, n.d.). Likewise previous research has shown that differing civilian and military opinions shaped policy debates at the highest decision-making levels within the United States during the Cold War (e.g., Betts 1991, Gacek 1994, and Petraeus 1989). We assess whether this opinion gap "matters" in terms of the actual conduct of American foreign policy.

Specifically, we examine whether the prevalence of military experience among the policymaking elite affects the propensity of the United States to use military force. Because veteran opinion corresponds with military opinion, we use veteran presence in the political elite as a proxy for measuring the civil—military gap over time. Relying on a composite measure of military experience across the executive and legislative branches of government, we examine the impact of elite military experience on the U.S. propensity to initiate and to escalate militarized interstate disputes (MIDs) between 1816 and 1992.

#### FROM BELIEFS TO BEHAVIOR: THE CIVIL-MILITARY GAP AND INTER-STATE CONFLICT

Analyses of U.S. decision making during Cold War crises point to a general civil-military pattern of

disagreement across two dimensions: (1) the decision regarding whether/when to use force and (2) the decision regarding how to use force. Civilian leaders tended to be more willing to use the military to address a diplomatic problem but favored using the military in a constrained way to minimize the chance that the crisis would escalate out of control. Military leaders tended toward greater reluctance in adopting a military solution to a diplomatic problem but, if the military was to be used, favored fewer restrictions so the military could use force in a quick and decisive manner (e.g., Betts 1991, Gacek 1994, and Feaver 1995).

A similar pattern emerges in recent surveys of civilian and military elites. Compared to midcareer activeduty military officers, civilian elites are somewhat more interventionist with regard to the range of issues over which they will support the use of force by the United States. Military officers report what may be called a "realpolitik" view that reserves the use of force for interstate issues that represent a substantial threat to national security, such as control of territory, the maintenance of geostrategic access and position, and the defense of allies. Civilian elites, on the other hand, are somewhat more likely than military officers to report an "interventionist" view that extends the use military force to address additional issues that do not fit within this interstate security paradigm. Such goals include human rights abuses, the internal collapse of governance, and the desire to alter a state's domestic regime. Thus, interventionists will generally have a wider set of issues across which they will support the use of force, while realpolitik thinkers will support force only over a narrower range of issues.2 In other words, civilian and military views converge somewhat when considering potential realpolitik uses of force but diverge more sharply when considering potential "interventionist" uses of force. Significantly, respondents in the civilian elite who had previously served in the military report views that track more closely with active-duty military officers than with nonveterans in the civilian elite (Feaver and Gelpi 1999, n.d.).

Regarding the issue of how to use military force, civilians tended to endorse a greater willingness to place constraints on the manner in which force is used, whereas military respondents tended to endorse a position that has come to be known as the Powell Doctrine of overwhelming force (Dauber 1998; Stevenson 1996). The doctrine calls for using force only when the political will to do so essentially without restrictions—or only with very broad restrictions such as the prohibition of nuclear weapons—is clearly present. The Powell

<sup>1</sup> During earlier periods in U.S. history, other matters such as the defense of American commercial interests were more prominent "interventionist" issues. Recent survey results also indicate that military officers are less likely to view U.S. economic relationships as "a matter of national security" (Feaver and Gelpi n.d.).

Doctrine is based on the putative lessons of Vietnam but can be traced back to the "never again" or "all or nothing" school of senior military disenchanted with the restrictions imposed by political leaders during the Korean War (Gacek 1994). This view could not contrast more starkly with those of civilian elites such as Albright, who vigorously contended that "[the use of force] doesn't have to be all or nothing. We should be able to use limited force in limited areas." Once again, existing research suggests that military veterans within the civilian elite give responses that track more closely with active duty military officers than with nonveterans such as Albright (Feaver and Gelpi 1999, n.d.).

How, in theory, might these opinion differences affect the actual conduct of American foreign policy? The American military has never openly challenged the fundamental principle of civilian control. Nonetheless, even within the basic framework of civilian control, one can imagine varying levels of military influence. Military preferences shape U.S. foreign policy to a greater or lesser extent through at least three significant mechanisms. First, given their obvious expertise regarding the use of force, military advisors have the opportunity to persuade civilian policymakers to adopt views that reflect the beliefs and preferences of the military. Second, military officers have the opportunity to influence policy by shaping the kinds of options that are presented to civilian leaders. Third, even if military advisors are unable to alter the views of policymakers, their preferences may constrain policymakers because of the leverage that the military can give to competing civilian elites (e.g., elite members of a competing political party or faction). The norms of civilian control may inhibit military leaders from openly and publicly challenging civilian decisions regarding the use of force, but competing civilian elites are under no such constraint. Research indicates that one of the keys to maintaining public support for the use of force is the existence of a supportive elite consensus (Larson 1996).

We hypothesize that military preferences will have greater influence on civilian policy choices when the civil-military gap is narrow (i.e., when civilian leaders preferences are similar to those of the military). Because civilians who have served in military have preferences that are closer to the those of the military, ceteris paribus, the presence of veterans in the civilian leadership can serve as a proxy measure for the width of this civil-military gap: the more veterans there are in the civilian leadership, the greater the influence of military preferences on civilian policy choices.

Of course, the decision to use force is influenced by many factors, of which civil—military relations may not be the most important. The presence of these other factors presents a challenge for testing the influence of the civil—military opinion gap over time. Even so, it should be possible to isolate the impact of civil—military relations relative to other contributing factors that shape the use of force. The hypotheses that follow, then, are all subject to the *ceteris paribus* condition; controlling

of national security" (Feaver and Gelpi n.d.).

<sup>2</sup> Jentleson (1992, 1998) makes a further empirical distinction between interventions designed to alter the regimes of other states and those designed to prevent human rights abuses. Our survey analyses (Feaver and Gelpi n.d.) did not reveal such a distinction in opinion at the elite level. Moreover, our measures of conflict behavior cannot capture the distinction between a humanitarian and a state-building intervention.

<sup>&</sup>lt;sup>3</sup> Comments made on *The News Hour with Jim Lehrer*, January 9, 2001

for all the other factors that affect the decision to use force, we expect the following.

Hypothesis 1. As the proportion of civilian policymakers with military experience increases, the probability that the United States will initiate militarized disputes will decrease.

Hypothesis 2. The impact of policymakers' military experience on American decisions to initiate militarized disputes will be more pronounced with regard to interventionist threats rather than realpolitik threats.

Once the decision to use military force has been made, the nature of the military's advice to civilian elites will reverse. Regardless of whether the mission is "realpolitik" or "interventionist," the military always prefers the large-scale use of force to the limited use of force. Thus, once civilian policy makers have decided to use force, military advisors will always counsel strongly for using force on a large scale. Once again, we expect this advice to be more influential when the civil—military gap is small.

Hypothesis 3. As the proportion of civilian policymakers with military experience increases, the level of force the United States uses in disputes it initiates will increase.

# MEASURING THE IMPACT OF THE CIVIL-MILITARY GAP ON AMERICAN CONFLICT BEHAVIOR

To test these hypotheses, we relate the civil—military gap to U.S. conflict behavior over the nineteenth and twentieth centuries while controlling, as far as possible, for other factors that are known to shape the use of force.

#### Scope

We test for the impact of the elite civil—military gap on American decisions to use force with a cross-sectional time-series dataset composed of interstate dyads of which the United States was a member between 1816 and 1992. State membership is determined by the Correlates of War (COW) definition of membership in the international system. One difficulty in using such dyadic-pooled time-series data is determining which states were capable of interacting. During the latter part of the twentieth century, this issue seems less salient because of the frequent opportunities for

interaction among states. As we move back in time through the nineteenth century, however, it becomes less plausible to assume that all states were capable of fighting with one another. Following a number of prominent analyses of the use of force, we address this problem by analyzing only "politically relevant" dyads (Maoz and Russett 1993; O'Neal and Russett 1997), which are defined as (1) any pair of states in which at least one of the states is a major power or (2) any pair of states that share a border or are divided by less than 150 miles of water.<sup>5</sup>

Since the United States became a major power (according to the COW Capabilities dataset) in 1898, this rule implies that we analyze all interstate dyads including the United States from 1898 onward. Prior to 1898, the rule implies that we analyze American relations with all of the major powers during that period as well as American interactions with Mexico.<sup>6</sup>

## Dependent Variable 1: Initiation of Force by the United States

Our first dependent variable is the *propensity* of the United States to initiate the use of force. We code American initiations of force based on the COW MIDs dataset, which defines the initiation of militarized disputes as explicit threats to use force, displays of force, mobilizations of force, or actual uses of force (Jones, Bremer, and Singer 1996). This variable is coded on an annual basis for each dyad, set at 1 for each year that the United States initiated a militarized dispute against the other state in the dyad and at 0 otherwise. 8

<sup>&</sup>lt;sup>4</sup> This dataset was defined through the use of EUGene, a data generation program produced by D. Scott Bennett and Allan C. Stam (1998). The analysis of binary-pooled time-series data has recently come under considerable methodological criticism. We approach the problem of temporal dependence in the manner advocated by Beck, Katz, and Tucker (1998). In addition, we rely on Huber–White robust standard errors that allow for clustering on each dyad to deal with spatial autocorrelation and heteroskedasticity. Because of the skewed distribution of the dependent variable, we also tested King and Zeng's (2001) rare event logit estimator. It produced identical results, so we retained the traditional logit specification.

<sup>&</sup>lt;sup>5</sup> The analysis of "politically relevant" dyad-years versus all dyad years has been a source of some debate. In general, the effect of analyzing politically relevant dyads should be to increase the size of estimated coefficients by reducing the problems associated with analyzing rare events (King and Zeng 2001). Because the United States became a major power in 1898, our analysis does look at all dyads in the twentieth century. The impact of veterans remained consistent across the nineteenth and twentieth centuries, suggesting that the selection of politically relevant versus all dyads is not an issue for this analysis.

<sup>&</sup>lt;sup>6</sup> This excludes U.S. conflicts with Native American tribes because the COW datasets do not identify these groups as nation-states.

<sup>&</sup>lt;sup>7</sup> We also investigated the possibility that the presence of veterans might be associated with the probability that the United States would become a target in a militarized dispute. No such hypothesis emerges from our data on civilian and military preferences, but we investigated the possibility that other states might anticipate levels of U.S. "interventionism" and alter their behavior based on the perceived preferences of U.S. leaders. We found no support for this hypothesis. Thus—as expected by our argument—the initiation of U.S. MIDs is related to the presence of veterans but the targeting of MIDs against the United States is not. This pattern increases our confidence that we are identifying a causal relationship rather than a spurious correlation between veterans and the overall frequency of disputes.

<sup>&</sup>lt;sup>8</sup> As is the case with all analyses of dispute initiation, the distribution on this dependent variable is quite skewed. The United States was a member of 8,790 politically relevant dyad years from 1816 to 1992 and it initiated disputes in 111 of those cases. U.S. dispute initiations were relatively rare (1.26% of the cases) but did differ substantially from the frequency of dispute initiations in a random sample of politically relevant dyad years. As noted below, King and Zeng's (2001) rare-events logit estimator yielded results identical to those presented here.

## Dependent Variable 2: Level of Force Used by the United States

Our second dependent variable is the level of force used by the United States in the disputes that it initiated. In the MIDs dataset the highest level of force used by each side in a dispute is coded on a five-point scale, as follows: 1 = no militarized response to a MID initiation by the other state, 2 = threat of force, 3 = show of force, 4 =use of force, and 5 =war. For our purposes, of course, the first category of this variable is irrelevant, for we analyze the level of force only if the United States initiated a dispute. Threats of force involve verbal actions that are not supported by militarized behavior. A show of force involves the actual movement and use of troops but stops short of extended or direct combat. The use of force involves direct military hostilities but short of full-scale war. Wars are defined as military engagements in which the combatants suffer at least 1,000 battle deaths.

# Key Explanatory Variable: The Elite Civil–Military Gap

We have no way of directly measuring the preferences of policymakers regarding the use of force across the span of American history. However, we can measure the military *experience* of American policymakers. As we discussed above, this measure acts as a surrogate indicator for the presence of "military views" within the civilian policymaking elite.

Focusing on military experience as a measure of the gap fits nicely within the causal chain with which we link the civil-military gap to the use of force. We view the impact of the gap as a two-stage process. First, military experience shapes individuals' attitudes and preferences regarding the use of force. Second, these differing preferences, in turn, alter American conflict behavior. That is, although our aggregate analysis of American conflict behavior draws a direct linkage between military experience and dispute behavior, we view attitudes as an intervening variable between military experience and American foreign policy.

Our approach requires us to assume that the link between opinions about the use of force and military/veteran status has been more or less constant over the time. Specifically, we assume that the general structure of civil-military differences has remained fixed over time. Considerable evidence suggests that this assumption is reasonable. Although changes have occurred at the margins, the broad contours of recent survey results (Feaver and Gelpi 1999, n.d.) are consistent with the findings of several studies of U.S. civilmilitary relations during the Cold War (Betts 1991, Petraeus 1987, 1989), with Huntington's (1957) canonical consideration of the sweep of U.S. civil-military relations since the founding of the Republic, and with Upton's (1917) classic critique of nineteenth-century American civil-military relations. Compared to military officers, American civilian leaders have tended to be more willing to use force as a foreign policy tool and

more willing to constrain how that force is used. As Albright said, "Limited force in limited areas." Importantly, if our assumption is invalid and veteran status is not associated with foreign policy preferences in a consistent manner, then our estimates will generally tend to be dampened toward zero and we will thus be less likely to uncover any statistically significant relationships.

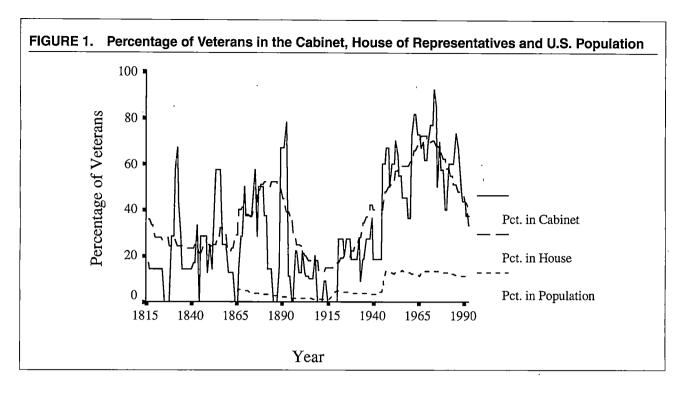

The next issue is the determination of whose military experience might be relevant for predicting the use of force. The President's military experience should be an important aspect of this process, but the President's own military experience should by no means be the only factor. The President inevitably relies on advice from members of his Cabinet and his national security team, so surely their military experience will shape the views and the information they convey to the President. In addition, the President must also be concerned about how other policymakers will respond to his decisions regarding whether and how to use force. Congress has often publicly debated American decisions to use force, and as we noted earlier, public support for a military operation may depend critically on the existence of an elite consensus in support of the operation (Larson 1996). Thus, the President must be concerned with whether legislators will hold hearings or make public statements that question the administration's policy. Congress also retains an important budgetary and constitutional link to American uses of force, and the President may consult directly with prominent members of Congress who have expertise in foreign affairs.

Consequently, our measure of the military experience of policymakers encompasses the executive and legislative branches. We do not include the military experience of the Supreme Court or other aspects of the judiciary because judges have not historically played a role in American decisions to use force, nor have they debated such decisions publicly. For the executive branch, we recorded the percentage of veterans serving in the Cabinet for each year. Thus we include the military experience of the President, the Vice President, and any other Cabinet officers serving during that year. Data for this variable are from the Biographical Directory of the Executive Branch, 1774–1989 (Sobel, 1990)<sup>9</sup>. For Congress, we use the percentage of veterans serving in the House of Representatives for each year.10

To convey a sense of what these data look like, we display both of our measures of military experience in Figure 1. The proportion of veterans in the House ranged between 13% and 72%, while the percentage of veterans in the Cabinet ranged from 0% all the way to 92%. Both measures were low in the early nineteenth and early twentieth centuries, and both rose after the conclusion of the Civil War, World War I, and World War II.

 $^{10}$  We thank William T. Bianco (2001) for generously sharing these data with us.

<sup>&</sup>lt;sup>9</sup> Data for 1990–92 were taken from the biographies of Cabinet secretaries available at the web sites of each Cabinet department.

The two variables are closely related to one another, correlating at .85 (p < .01). Thus, we combine these two indicators into a single composite measure of elite military experience by simply taking their average.<sup>11</sup>

# Secondary Explanatory Variable: Interventionist vs. Realpolitik Uses of Force

One important aspect of our argument is that civilians differ from those with military experience in terms of their willingness to use military force to address issues that are outside the realpolitik scope of American security policy—especially those that involve intervention inside other states. To test this hypothesis, we divided dyads into two categories: states whose actions could represent a threat to the core bases of American security and states whose actions could not represent such a threat. The former category we labeled "realpolitik" targets, and the latter we labeled "interventionist." We defined interventionist targets as any state that (1) faced worse than a 99:1 disadvantage against the United States in terms of relative military capabilities and (2) was not allied with a competing major power. Such small, nonaligned states clearly do not have the capability to threaten American security in a realpolitik manner. Instead, disputes with such states were likely to involve U.S. intervention inside the minor state because of domestic turmoil or because the United States was

dissatisfied with the policies or behaviors of the ruling government of such states. States that enjoyed less than a 99:1 disadvantage against the United States or were allied with a rival major power were coded as "realpolitik" targets. This coding rule results in approximately 51% of the dyad-years in our dataset being coded as "interventionist."

This division is crude, but it captures the essence of what we mean by U.S. "interventionism." Our measure of interventionism is intended to identify states against which the United States was likely to be using force for reasons other than the defense of traditional national security goals. To the extent that the United States initiated militarized disputes against "interventionist" states, it was targeting extremely weak states that were not allied with rival external powers. In such cases the United States was likely to be intervening in the domestic politics of such states to alter their governments or their governments' internal policies. Our hypothesis is that policymakers with military experience would be more reluctant to engage in such interventions.

#### **Control Variables**

A large literature on international conflict has already identified numerous factors that affect the use of force, including distance, military capabilities, and democracy, for example. To the extent that the elite military experience is correlated with any of these factors, the failure to include that factor in our analysis might bias our estimate of impact of elite veterans. As far as possible, we have controlled for every plausible alternative argument in our empirical analysis. Including additional control variables *cannot* artificially inflate the estimated impact of our variable of interest. It can, however, introduce problems such as

<sup>&</sup>lt;sup>11</sup> Because the two variables correlate so highly, however, differing functional forms had little impact on the results. For example, weighting the military experience of Cabinet members twice as heavily as that of House members had no impact on our results. Below we demonstrate that our findings are robust across several other variations in these coding rules.

multicollinearity.<sup>12</sup> Such problems would inflate the standard errors of the coefficients and could reduce the statistical significance of our results. Thus, the inclusion of control variables can only provide a more stringent test of our hypotheses. 13 Including these variables also allows us to compare the impact of elite military experience to the influence of other prominent causes of conflict.

The variables that we utilize are clustered into three categories: variables that that address likely counterarguments or potential sources of spuriousness for our results; variables that are not likely sources of spuriousness but are known to be important determinants on the use of force and thus are useful for illustrating the comparative importance of our main explanatory variable; and variables that are needed to address other methodological concerns.

#### **Potentially Confounding Variable 1:** Log of Casualties in a Previous U.S. War

Controlling for the human costs of U.S. participation in a war helps address one of the most obvious counterarguments to our finding of a relationship between elite veterans and the use of force: American war experience. The presence of veterans in the political elite is obviously a function of U.S. participation in a war and it is reasonable to expect American conflict behavior to change after a major war. Perhaps this war memory or "war weariness" is the true causal factor, and the presence of veterans in the political elite merely an artifact of the costs of that war. Our measure of war weariness is the natural log of the number of U.S. fatalities suffered by the United States in its most recent war. 14 Data on

<sup>12</sup> Multicollinearity levels do become high (auxiliary  $R^2 = .8$ ) for the elite veterans variable because of our specification of an interaction with interventionist targets. Auxiliary regressions for the balance of military capabilities also revealed relatively high collinearity levels (auxiliary  $R^2 = .71$ ). Nonetheless, elite veterans, its interaction term, and military capabilities all retain their statistical significance, making the issue of multicollinearity irrelevant. The dummy variables for the major power status of the United States and its partner in the dyad also suffer from some moderate collinearity problems (auxiliary  $R^2$  values are .5 and .71 respectively), which could account for their statistical insignificance; however, the relatively small size of their coefficients appears to be a more likely cause. Comparing their coefficients to our estimate for the impact of the Cold War (also a dummy variable making such comparisons possible), we can see that the standard error for the U.S. major power status variable is smaller than the standard error for the Cold War variable. Its coefficient, however, is less than one-fourth the size of the impact of the Cold War. Auxiliary regressions on all other variables revealed auxiliary  $R^2$  values of less than .2.

One circumstance in which it could be inappropriate to include a variable as a "control" would be if that factor actually served as an intervening variable between our antecedent variable (elite military experience) and our dependent variable (the use of force). Controlling for an intervening variable may cause the antecedent variable to "disappear" from the equation because its influence is exerted only through the intervening factor. The insertion and removal of the intervening factor could be used to demonstrate the nature of the causal linkage, but one should not infer from such an analysis that the antecedent variable has no effect.

We estimated a variety of decay functions for the decline of the war-weariness effect over time. However, the simple log of U.S. casualties fit the data best.

U.S. war fatalities were drawn from the Directorate for Information Operations and Reports (Statistical Information Analysis Division), U.S. Department of Defense (http://www.web1.osd.mil/mmid/casualty).

#### **Potentially Confounding Variable 2:** Percentage of Veterans in the American Public

Controlling for the percentage of veterans in the American public provides a further test of the war-weariness hypothesis. The percentages of veterans in the elite and the mass are likely to be correlated because they are both affected by the extent of U.S. participation in major wars. Perhaps any correlation between political elite veterans and the use of force is an artifact of a deeper relationship between the general public and conflict proneness. That is, perhaps the political elite is merely responding to the broader currents of war weariness in the general public. Data for the number of veterans in the U.S. public were received from the Department of Veterans Affairs, and data for the total U.S. population figures were drawn from the COW dataset on national capabilities.<sup>15</sup> The percentage of veterans in the American public is displayed in Figure 1.

#### Potentially Confounding Variable 3: **Cold War Years**

As noted above, the percentage of veterans reached its height in the years following World War II. This time period, of course, was also the period of the Cold Warthe most intense security competition in U.S. history. Thus, we would expect the United States to have exhibited a greater propensity to initiate the use of force quite independent of any civil-military effect. The Cold War broke out for reasons that were exogenous to (but correlated with) the increase in veterans among U.S. policy makers. Thus the failure to control for the Cold War period would lead us to attribute changes in American behavior to other factors when they were most likely due to the new global role that the United States assumed in the wake of World War II.<sup>16</sup> This indicator is a dummy variable that equals 1 during the years 1946 to 1989.

#### Potentially Confounding Variable 4: **U.S. Involvement in Other Disputes**

Both presidents and the mass public may be more likely to select policymakers with military experience when

After presenting our results, we discuss a number of sensitivity analyses that address the robustness of our findings across various

historical periods-including the Cold War.

<sup>&</sup>lt;sup>15</sup> Data on the number of U.S. veterans were available only from 1865. Thus, we estimate our equations both with and without this control variable. Missing data points after 1865 were interpolated from the time series using STATA version 6.0. Because the time series is generally smooth, the interpolated values appear to provide a good fit. We tested the interpolation process by interpolating the entire time series based only on one observation per five-year period. Regressing these interpolations on the true values yielded an  $R^2$ of greater than .96.

they perceive the United States as facing substantial security threats. Thus, if elite military experience is positively related to American involvement in disputes, this result may be an effect rather than a cause of that involvement. Our first step toward solving this problem was to define our dependent variable as American *initiations* of disputes. In addition, however, we also control for the number of disputes the United States was involved in each year (as either initiator or target) outside the dyad under consideration.

# Potentially Confounding Variable 5: Political Party in Power

Recent evidence suggests that military officers increasingly identify with the Republican Party (Holsti 2001). In addition, recent Republican administrations have been perceived both as having greater military representation among their ranks and as being more sympathetic to the views of the military than have Democratic administrations. At the same time, Republican administrations have frequently been depicted as relatively hawkish on foreign policy issues. Thus we control for the political party in power to distinguish the impact of military views from the impact of the Republican Party.

# Potential Confounding Variable 6: Balance of Military Capabilities

One robust finding in the literature on conflict propensity is that states of vastly unequal military capabilities are unlikely to engage in conflict with one another (Blainey 1973; Organski and Kugler 1980). America experienced dramatic increases in power around the turn of the twentieth century and after World War II. Shortly after each of these changes, the percentage of veterans in the policymaking elite increased as well. Thus we must control for American capabilities to distinguish their influence from the impact of elite military experience. We measure the balance of military capabilities within a dyad with COW data on national material capabilities. For each year we calculate the proportion of the capabilities within each dyad that is controlled by the United States (i.e., U.S. capabilities/(U.S. + adversary capabilities), subtract 0.50, and take the absolute value. The resulting variable ranges from 0 (perfectly equal capabilities) to 0.50 (capabilities entirely controlled by one state in the dyad). We then rescale this variable from 0 to 1 to make it consistent with standard measures of relative capabilities.

## Comparative Variable 1: Shared Alliance, Ties

-States that share security interests should be less likely to engage in militarized disputes with one another (Bueno de Mesquita 1981; Bueno de Mesquita and Lalman 1992). Accordingly, we include a  $\tau$ -b measure of alliance portfolio similarity between the United

States and the other dyad member in each dyad-year. In principle, the  $\tau$ -b similarity score ranges from -1 to 1, with higher values representing more similar alliance patterns; in our data, similarity scores range from -0.46 to 1.17

#### **Comparative Variable 2: Major Power Status**

Another well-established finding is that major powers are substantially more likely to become involved in disputes (Bremer 1992). Because the United States became a major power roughly halfway through the time period, and because this status altered the set of "politically relevant" dyads, we control for whether both the United States and its potential adversary were major powers. Again, major power status is coded on the basis of the COW dataset on national material capabilities.

# Comparative Variable 3: Adversary's Level of Democracy

The extensive literature on the democratic peace has established democracy as one of the most robust and important determinants of international conflict (Bremer 1992; Maoz and Russett 1993; Ray 1995). Thus, we include the level of democracy in the opposing state. Consistent with most of the literature on the democratic peace, we measure democracy on the basis of the Polity III dataset (Gurr and Jaggers 1996). We create a net democracy score for each state, defined as its democracy score minus its autocracy score. This variable ranges from -10 (autocracy) to 10 (democracy).

### Comparative Variable 4: Distance between States

One of the strongest findings in the study of international conflict is that states that are near one another are more likely to engage in military conflict (Bremer 1992). Thus, we control for the distance between the United States and its potential adversary in the dyad. We measure this as the log of the number of miles between capital cities, unless the two states are contiguous, in which case the distance is defined as 0. States are coded as "contiguous" if they share a land border or if they are separated by less than 250 miles of water.

### Comparative Variable 5: Adversary's Level of Force

We control for the level of force used by the opposing state, which is measured according to the five-point scale described above.<sup>18</sup>

<sup>&</sup>lt;sup>17</sup> A dummy variable identifying states with which the United States shared a direct alliance tie yielded similar results.
<sup>18</sup> Our use of the level of force used by the opposing state as a control

variable in explaining the level of force used by the Opposing state as a control variable in explaining the level of force used by the United States is a rather crude specification of crisis escalation. In fact, the United States and its adversary were likely to be interacting strategically as

## Methodological Control 1: Peace Years in the Dyad

We correct for temporal dependence in our binary time-series cross-sectional data by accounting for the number of years that have elapsed since the previous conflict within the dyad (Beck, Katz, and Tucker 1998). We model the impact of time by including dummy variables for each elapsed year of peace because this method is both simple and flexible in dealing with any possible pattern of temporal correlation. As it happens, the dummy variables are statistically significant for peace years 0 through 4; thus, we retain only these five dummy variables.

### Methodological Control 2: Selection Effects Parameter

As in any analysis of crisis escalation, we must cope with the issue of selection effects. Since the United States had to initiate a dispute before it could engage in escalation, the cases in which we can observe American decisions regarding escalation are self-selected. This nonrandom selection process can bias the coefficients in the analysis of the level of force used by the United States. We account for the nonrandom selection of crises by modeling the initiation and escalation decisions as a set of simultaneous equations.<sup>20</sup> In the selection equation we estimate a predicted probability of dispute initiation. We then insert this predicted value as a control variable in our analysis of escalation. By accounting for the expected probability of a dispute, we correct for the self-selection process.<sup>21</sup>

# DOES THE CIVIL-MILITARY GAP INFLUENCE AMERICAN CONFLICT BEHAVIOR?

We conducted a logit analysis of every politically relevant interstate dyadic relationship in which the United

they escalated a militarized dispute. This strategic interaction creates a problem of censored data (Signorino 2000; Smith 1999). Fortunately, our results remained robust when we specified the escalation of the United States and its adversary as endogenous variables in a bivariate probit. We retained the current specification so that we could use the full range of the COW escalation variable rather than dichotomizing it for the bivariate probit.

19 Controlling for peace years with a spline function yielded identical results.
 20 A necessary condition for the identification of a system of equa-

A necessary condition for the identification of a system of equations is that at least one exogenous variable be excluded from each equation. In our analysis, the hostility level of the adversary is excluded from the selection equation because the dispute initiation by the United States is temporally (and causally) prior to the opponent's escalation decision. The impact of peace years in the dyad and the number of years since U.S. participation in a war are excluded from the escalation equation because these temporal effects are no longer relevant once a dispute has been initiated.

relevant once a dispute has been initiated. <sup>21</sup> In addition to this two-stage selection model, we also estimated a Heckman selection model that estimates the initiation and escalation equations simultaneously. Once again, our results regarding the impact of veterans remained robust across both estimations. Again, we retained the current specification so as to utilize the full COW

escalation scale.

States was a partner from 1816 to 1992. Table 1 presents our analysis of the propensity of the United States to initiate militarized disputes. Our results provide strong and striking support for hypotheses 1 and 2. As predicted, the negative coefficient for elite veterans is statistically significant, indicating that the more veterans there were in the political elite, the less likely the United States was to initiate the use of force. Also as predicted, the effect of veterans on the propensity to use force was even greater in "interventionist" cases. As indicated in column 3 in Table 1, the coefficient for this variable for realpolitik dyads is only -.19 (p < .10). With regard to interventionist dyads, on the other hand, the coefficient is calculated by adding that value to the coefficient on the interaction between the percentage of veterans in the policy elite and an interventionist threat (-.47, p < .01). Thus the overall effect of elite veterans for interventionist dyads is -.66—more than three times the impact for realpolitik dyads.

Figure 2 displays the predicted probability that the United States would initiate a militarized dispute as the percentage of veterans in the Cabinet and Congress ranged from its historical near-minimum of 10% to its historical near-maximum of 80%.22 When only one policymaker in 10 had military experience, the probability that the United States would initiate a dispute within a given dyad was approximately 3.6%. At first glance, this might look like a relatively low risk. But because militarized disputes are rare events, a 3% probability of a dispute between a given pair of states actually indicates a relatively high risk. Moreover, the large number of dyads in which the United States was involved each year magnifies the effect of a 3% probability. For large portions of our dataset the United States was engaged in more than 100 such dyads per year. Thus, a 3% per dyad probability of a dispute yields a prediction that, holding all other factors that influence the decision to use force hypothetically constant, the United States might initiate several additional militarized disputes per year because so few policymakers had military experience.<sup>23</sup>

Conversely, of course, as the percentage of policy-makers with military experience increases, the probability of dispute initiation drops substantially. The impact of these changes is slightly nonlinear, with the greatest decreases in the probability of a dispute occurring as the percentage of veterans ranges between 10% and 67%. By the time the rate of military experience among policymakers reaches 67%—the probability that the United States would initiate a dispute

<sup>23</sup> An event count model that estimated the overall number of disputes initiated by the United States each year estimated the marginal impact of moving from 10% veterans to 80% veterans as an average

of 1.3 initiations per year.

 $<sup>^{22}</sup>$  We select this range of variation because approximately 95% of the cases we observe are within this range. The historical minimum percentage of veterans is 6.5% and the maximum percentage we observe is 81.2%. The mean value for this variable is 46.7% and the standard deviation is 20.3%. The median percentage of veterans in office is 50%, while the first and third quartiles are 28% and 61%. Thus our variation from 10% to 80% represents a plausible set of hypothetical values for judging the marginal impact of this variable.

within a given dyad drops from 3.6% to 0.7%—more than an 80% decrease from its previous value. Further increases in elite military experience up to 80% reduce the probability of a dispute within a dyad to nearly 0.4%.

Also in Figure 2, we compare the impact of elite veterans on the probability that the United States would initiate a crisis against realpolitik and interventionist threats. As one would expect from the results in Table 1, the impact of elite veterans is much greater for interventionist cases. When few veterans are in office the United States is much less likely to initiate a dispute against realpolitik and interventionist targets. Specifically, when only 10% of policymakers are veterans, the probability of a U.S. initiation in a realpolitik dyad is about 4%, and in an interventionist dyad it is approximately 6%. As the percentage of elite veterans

increases the probability of a dispute drops within both sets of dyads, but the decline is much steeper in the interventionist group. In fact, by the time the percentage of veterans reaches 50%, the United States is actually more than three times as likely to initiate force against a realpolitik threat. When the percentage of veterans nears its historical maximum, the probability of initiation against a realpolitik threat is 1%, while the probability of initiation against an interventionist threat is only 0.08%. These results are made all the more striking by the crude nature of our distinction between realpolitik and interventionist threats. More careful theorizing and empirical work on these categories would surely increase the decisiveness of this distinction.

Many of our control variables also have a significant impact on U.S. dispute initiation, but none of these effects can account for the impact of elite veterans. For

<sup>&</sup>lt;sup>a</sup>For reason of space the temporal dependence coefficients are not reported here. As expected, years since the previous U.S. initiation did have a significant and nonlinear effect on U.S. dispute initiation as expected by Beck, Katz, and Tucker (1998).

example, our analysis supports the war-weariness hypothesis. The coefficient for the log of U.S. casualties in the previous war is negative and statistically significant, but it does not account for the impact of elite veterans. The percentage of veterans among the U.S. public, on the other hand, has no significant effect. The fact that elite military experience matters while military experience among the public does not fits precisely with the elite-level causal mechanism that we hypothesized. The coefficient for Republican administrations was consistently positive but did not quite achieve statistical significance (p < .11 for the model in column 1, Table 1). Thus any possible association between the U.S. Military and the Republican Party cannot account for the relationship between elite military experience and American conflict behavior.<sup>24</sup>

Most of the other control variables perform as expected, consistent with the established literature. Not surprisingly, for example, the positive coefficient for the Cold War years indicates that this period witnessed a significantly larger number of American dispute initiations than other periods of U.S. history. The negative coefficient on the opponent's democracy score indicates that the United States is significantly less likely to initiate disputes against other democratic states. The

balance of military capabilities also has a significant impact on American initiation of disputes. This negative coefficient indicates that the United States is less likely to initiate disputes in dyads where military capabilities are highly unequal. Common security interests (as measured by alliance similarity) also had a significant dampening effect on American initiations of disputes. And not surprisingly, distance also had a dampening effect on America's propensity to initiate disputes. American involvement in other disputes, on the other hand, had no impact on decisions to initiate additional disputes. America's status as a major power also had no impact on its initiation of disputes, nor did the major power status of the adversary.

How does the substantive impact of the civil—military gap compare to the impacts of the control variables? In Table 2, we list the statistically significant variables and the range across which we varied them to generate the predicted effects. In the third and fourth columns, we display the changes in the probability and in the relative risk of a dispute initiation.

Clearly, the impact of elite military experience continues to be substantial, even when we compare it to other prominent and well-established sources of international conflict. Specifically, our model predicts that a change in the percentage of elite veterans from 10% to 80%—a shift from slightly less than two standard deviations below the mean to slightly less than two standard deviations above—will generate a 3.7% reduction in the probability of U.S. dispute initiation across all dyads. This change corresponds to an 88% reduction in the relative risk of a dispute.

Even the Cold War, which obviously had a substantial impact on American involvement in militarized disputes, did not have as large an impact as elite military

 $<sup>^{24}</sup>$  It is also worth noting that we find little evidence of a general relationship between Republicanism and elite military experience. Since the onset of two-party competition between the Democratic and the Republican parties in the midnineteenth century, Republican Cabinets have averaged approximately 5% more veterans, but this gap is not statistically significant. In the House of Representatives, on the other hand, the percentage of veterans was more than 18% higher under Democratic control (p < .01). However, this gap seems more likely to be a chance result of the timing of Democratic control than a direct link between military experience and Democratic partisanship.

experience. The United States was at an 80% lower risk of initiating militarized disputes prior to the outbreak of the Cold War, but as large as this effect is, it remains smaller than the 88% reduction in risk associated with increased veteran representation in the political elite. Other traditional "realist" variables such as relative military power and alliance ties also had a substantial impact on American dispute behavior, but neither of them outstripped the impact of elite military experience. These results are particularly important in light of the amount of attention that the Cold War, military capabilities, alliances, and the structure of the international system have received as explanations of international conflict and American foreign policy. Our results suggest that American military behavior had been as powerfully influenced by the military experience of its leaders as it has by America's position in the international system.

Similarly, the much-touted impact of democracy is smaller than the impact of elite military experience. A shift in the democracy score of the opposing state from its minimum value of -10 (pure authoritarian state) to its maximum of 10 (pure democracy) reduced the probability that the United States will initiate a dispute by 1.1%—a reduction in relative risk of 59%. This impact is undoubtedly substantial, but it remains considerably less than the 88% reduction in risk associated with closing the civil-military experience gap among the political elite.

Put another way, our results raise questions about the primacy that post-Cold War administrations have given to spreading democracy around the world as a way of reaping the so-called democratic peace. To be sure, the spread of democracy is a substantial and important factor and, once the democratization process has taken root, can be expected to dampen the likelihood that the United States will use force. This strategy may ultimately yield a peace dividend, but our results suggest that an even more effective way to reduce the

likelihood that the United States will use force, other things being equal, is to increase the percentage of veterans serving in policymaking positions.

### DOES THE CIVIL-MILITARY GAP INFLUENCE HOW AMERICA USES FORCE?

Does elite military experience also have an impact on the American escalation disputes? The answer to this question—displayed in Table 3—appears to be an unqualified "yes." Our results indicate that higher percentages of veterans in the political elite were associated with greater levels of force by the United States—if the United States did initiate the use of force. The coefficient for the percentage of veterans in the Cabinet and in Congress is positive and statistically significant, and the impact of this variable is substantial.

Figure 3 indicates that as the percentage of veterans in the Cabinet and Congress increases from 10% to 80%, the probability that the United States would engage in direct combat (use of force coding) increases from 2% to 73%. This same increase in the percentage of elite veterans increases the probability that the United States will escalate the dispute to the level of becoming a war from 0.06% to 9%. The latter increase is particularly substantial given the rarity of wars (0.2% of the dyad-years) and the gravity of escalating to such a level. Most of this impact is felt after the percentage of policymakers with military experience exceeds 33%. Thus policymakers with military experience may well have favored something like an informal Powell Doctrine long before any such doctrine was articulated, far back in American history.

Table 4 compares the marginal impact of changes in policymakers' military experience with the impact of other statistically significant variables in the model. We see that the impact of elite military experience is large in comparison to these other variables. Only the Cold War, which we take to be a surrogate for nuclear deterrence, arguably has a greater impact on the level of force employed by the United States. The Cold War reduced the probability that the United States would engage its forces directly by 56% and reduced the probability that it would escalate to war by 18%. The impact of major power status is dwarfed by the impact of

 $<sup>^{25}</sup>$  We use minimum and maximum values because of the bimodal distribution of this variable. Opposing states with democracy scores below -6 or above 6 comprised well over half of our dataset. In fact, opposing states with democracy scores of -10 comprised more than 5% of our dataset and opposing states with a democracy score of 10 comprised more than 15% of the cases.

military experience among American policymakers. America's status as a major power, for example, increases the probability that it would engage its forces directly by 12%. Conversely, the United States was 14% less likely to intervene directly against another major power. Neither of these variables, however, had any substantial impact on the probability that the dispute would escalate to war. Even the impact of the adversary's level of force is not as large as the impact of elite veterans. A change in the adversary's actions from "no response" to "full-scale combat" increased the probability of an American "use of force" by only 39%.

#### **ADDITIONAL TESTS FOR ROBUSTNESS**

We performed a variety of checks of the robustness of our results. Because elite military experience and "interventionist" targets are complex concepts with no

"standard" indicators, we reestimated our analyses of both dispute initiation and escalation with alternative measures of both concepts. For elite military experience we tested a measure that excluded the military experience of Cabinet members whose positions were not relevant to national security, as well as a measure that excluded the military experience of House members and focused only on the military experience of Cabinet members on the national security team (President, Vice President, Secretary of State, and Secretary of Defense/War). The impact of elite military experience remained consistent for both the initiation and the escalation of disputes and remained statistically significant across all these estimations. In fact, a dummy variable identifying when the Secretary of State was a veteran was consistently significant at the .10 level. It is worth noting, however, that a simple dummy variable coding whether or not the President was a veteran was not statistically significant for either the initiation or the escalation equation. This result is consistent with the idea that the preferences of presidential advisors (and potential critics) are relevant to U.S. foreign policy behavior. With regard to "interventionist" targets, we conducted analyses that identified any state facing greater than a 99:1 military disadvantage as an interventionist target regardless of its alliance ties to other major powers. We also conducted analyses that identified any minor power state that was not allied to a rival major power as an interventionist target. Our results remained robust.

Our pooled time-series analysis of dispute initiation heavily weights the post-World War II period because of the very large number of dyads during that period. To ensure that our results are stable across the span of American history, we also analyzed a single 177-year event count time series in which the dependent variable was the number of disputes initiated by the United States in each year. The coefficient for elite military experience remained negative and statistically significant (-.036; p < .002) and the impact of elite veterans remained substantively large. For example, the average number of dispute initiations per year over the 177year period is 0.56, or about one dispute every other year. The model predicts that a shift in the percentage of veterans in the policymaking elite from 10% to 80% would reduce the average number of dispute initiations by 1.3 per year.

We also distinguished various historical eras and then removed each era from the analysis to ensure that our findings are not limited to a specific period. Specifically, we used major military conflicts (the Spanish–American War, World War I, World War II, and the Cold War) to divide U.S. history into the following periods: pre-1898, 1898–1914, 1915–45, 1945–89, and post-1989. Our results remained consistent even when each of these historical eras was removed from the analysis. Although its substantive size varied somewhat, we found a consistent impact of elite veterans across the nineteenth and twentieth centuries and across the pre- and post-World War II periods.

Finally, we investigated whether the type of military service experienced by policymakers mattered and

found that it did not. Specifically, we found no distinction between the impact of elite veterans who served as officers and the impact of those who served as enlisted personnel. These results suggest the existence of a rather broad set of "military foreign policy preferences." Moreover, since those who served as officers generally did so by choice while those who served as enlisted personnel may have been drafted, these results suggest that "military preferences" may remain fairly consistent regardless of whether one's service was voluntary. Unfortunately, two potentially important distinctions we were not able to capture were combat experience and the timing of military experience (i.e., serving in wartime or peacetime). Consistent and reliable data on combat experience and the precise timing of military experience among the policymaking elite were not available.

#### **CONCLUSIONS**

Civil-military relations at the policymaking level often seem to be dominated by personalities. Contrast the problems of President Clinton with his war-hero predecessor, President Bush; compare the rumpled tenure of Secretary Aspin or the academic acerbity of Secretary Albright to the no-nonsense corporate mentality of Secretary Rumsfeld; or consider the unusual charisma and political clout of General Powell. Personalities matter and may be decisive in certain cases. Nonetheless, the findings presented here suggest that, at least when it comes to the use of force, we can identify consistent civilian and military tendencies in policymaking.

Other research has shown that elite civilians with military experience behave like "Colin Powells" and elite civilian nonveterans are like "Madeleine Albrights"—at least when it comes to opinions on the use of force (Feaver and Gelpi n.d.). What creates these different types? Why do civilians without military experience tend to have foreign policy views that systematically differ from the views of those who have served? We cannot definitively answer that question. We would contend, however, that service in the U.S. military is an important socialization experience that shapes individuals' attitudes. The military teaches lessons about

the role of military force in American foreign policy and lessons about how military force ought to be used. These lessons do not appear to be forgotten when individuals leave the military and enter civilian life. Of course, we cannot yet specify the precise mechanisms at work in this socialization process, and our data may be consistent with other explanations as well.26 Nonetheless, our results suggest that the relationship among military experience, foreign policy attitudes, and conflict behavior merits further attention.

Whatever the causes of this civil-military opinion gap, we have shown that the gap had a profound effect on American military behavior from 1816 to 1992. As expected, we found that the higher the proportion of American policymakers with military experience, the lower the probability that the United States would initiate a militarized dispute. Also as expected, we found that the impact of military experience on dispute initiation became even larger when we focused on states that represented "interventionist" rather than "realpolitik" threats to the United States. Finally, also as expected, we found that the higher the proportion of American policymakers with military experience, the higher the level of force used by the United States if it had initiated a dispute. Throughout these analyses, the impact of elite military experience was substantively large and often outweighed the impact of variables that have received considerably more attention in the study of international conflict.

It may be "normal" for military personnel and civilians to develop distinctive views regarding the use of force, but when this divergence of views begins to have an impact on American conflict behavior, one cannot simply shrug off the difference and say, "Who cares?" The difference in views between those with and those without experience in the American military is a profoundly important issue that is in need of public attention and discussion.

<sup>26</sup> An important competing hypothesis, of course, is that the civilmilitary gap is created by self-selection rather than socialization. That is, the civil-military differences we observe may be due to the fact that the military tends to attract individuals who already share its foreign policy views. In the absence of panel survey data looking at individuals' attitudes before, during, and after military service, we cannot definitively resolve this debate. However, several available pieces of evidence suggest that socialization is a more plausible explanation. First, our survey data (Feaver and Gelpi 1999) indicate that the reason that military respondents gave for why they joined the military did not have a significant effect on their foreign policy views. Similarly, as we discussed above, the presence of veteran policymakers who served as officers (self-selected) had the same impact on U.S. behavior as the presence of veteran policymakers who served as enlisted personnel (less likely to be self-selected).

## **BOOK REVIEWS**

### **Political Theory**

More Than a Historian: The Political and Economic Thought of Charles A. Beard. By Clyde W. Barrow. New Brunswick: Transaction Publishers, 2000. 289p. \$39.95.

Ruth O'Brien, John Jay College of Criminal Justice and the Graduate Center of the City University of New York

Clyde Barrow's *More Than a Historian* provides a fascinating intellectual history of Charles Beard, a political scientist whom he places in the "pantheon of thinkers that most scholars no longer read" (p. xvi). With 42 books, scores of coauthored books, and hundreds of articles and book reviews, Beard can be only characterized as amazingly prolific. Yet the only book that still resonates in political science and American history is *An Economic Interpretation of the Constitution* (1913). Barrow's history of Beard gives us ample reason finally to read it or read it again.

Barrow summarizes the argument in An Economic Interpretation of the Constitution in one line: "[C]apitalistic interests had dominated the constitutional convention and, consequently, they authored a founding document that appealed 'directly and unerringly to identical interests in the country at large" (p. 4). Struck by this powerful argument, Barrow suggests that a whole array of populists, progressives, liberals, radicals, and socialists used it as evidence that the Constitution was drafted by, and for, American capitalists. At the same time, he shows that an almost equally impressive array of academics, from Edward Corwin and Louis Hartz to Richard Hofstadter and John Diggins, have denounced An Economic Interpretation of the Constitution. More recently, Theda Skocpol "complained" that interest in the book wavers little since it represents "unquenchable proclivity in American historiography" (p. 243).

Barrow's central argument is that Beard has been woefully misread. Both scholars and the public on the Left and the Right got it wrong, Barrow suggests, by calling him a "dissembling Marxist" or a "disenchanted New Deal liberal" (p. xviii). To Barrow, Beard was influenced by three distinct yet overlapping schools of thought that carried great weight in the United States. The first is the German historical school or the philosophical tradition of Hegelians and neo-Hegelians. In an absorbing account, Barrow details how Beard selectively appropriated the ideas of neo-Hegelians like the Italian Benedetto Croce. The second is the institutional economics of the school of John R. Commons. The third influence is Marxian revisionist socialism.

Yet Beard was no mere imitator. Barrow meticulously explains how Beard's ideas of socialism differed from those of Marx. Believing that class struggle could never be resolved and that there was therefore no point in abolishing private property, Beard argued that labor could be recognized as a form of property and given the same constitutional protections that land and capital already enjoyed. Influenced by E. R. A. Seligman's The Economic Interpretation of History (1902), Beard differed from Marx in using James Madison's idea of class conflict. In particular, he relied on Madison's Federalist Number Ten, which includes conflicts between those who own property and those who do not; creditors and debtors; and those battling over different kinds of property, like land or capital. Beard abandons Marx's notion of exploitation by giving up the theory of value in favor of a concept of class struggle grounded in historical claims, which are open-ended and political. The "puzzle" for Beard, as Barrow puts it, involved explaining how the Federalists had

"wrenched political change from a seemingly insurmountable agrarian majority" (p. 48).

Chapter 5 offers a cogent discussion of Beard's ideas about a worker republic. Beginning in the 1930s, Beard became enthusiastic about a planned economy, supporting legislation like the National Industrial Recovery Act and the Agricultural Adjustment Act. Far left of the New Deal, he outlined a plan for economic and political restructuring that went beyond the boundaries of welfare-liberal New Deal economic policy. Beard recommended that a highly progressive income tax structure be associated with the redistribution of public expenditures for social goods. He also thought Congress should build a National Economic Council that would write an economic program promoting the public interest by creating what he described as a national standardof-life budget. Tallying up the total goods and services necessary to maintain an official standard, this council would be different from the European welfare states, which Beard claimed encouraged dependency on doles and transfer payments. The progressive tax structure, in combination with a constitutional amendment that gave workers the same rights as the owners of property and capital, would increase worker productivity.

Why bother setting the record straight by writing an intellectual history of a historian? To Barrow, Beard's oeuvre offers students of American political development, notoriously short on theory, a "highly original metanarrative" which can provide them with "critical insights" about the crisis of the American welfare state by pointing them in the direction of a post-Marxian socialist political theory (p. xviii). Barrow even suggests that Beard set the stage for "new historicism" in American political thought. Recasting the meaning and development of political ideas in terms of relations to authorial intentions, Beard was someone who helped democratize political theory by studying not just the works of major political theories but also those that other academics consider relatively minor.

By the end of the book, this reader was convinced that Barrow had rightfully resurrected Beard. Yet, like many biographers, Barrow is somewhat defensive about his subject. In taking on Beard's critics, Barrow devotes so much attention to his academic record that he does little to explain the political, economic, and cultural reasons behind his rise as such a great public intellectual. For instance, Barrow relays how members of a New York Republican club could barely hide their contempt for Beard, but he fails to explain what made them invite him in the first place. More than a Historian would have been more engrossing had Barrow done a little new history himself, showing exactly why a radical like Beard should have had such influence for almost a century in a conservative country like the United States.

How have our conceptions of politics changed, and how have these changes altered politics and its possibilities? These are the burning questions at one of the biggest campfires in political theory, and the answers are disputed as these three volumes show.

The History of Political and Social Concepts: A Critical Introduction is based on five essays published by Melvin Richter between 1986 and 1995. The revised essays describe the intellectual project of Begriffsgeschichte, or conceptual history of the transition to modernity in German political and social life. Richter compares this project to a related investigation of mentalités around the time of the French Revolution, and then contrasts the German and French versions of conceptual history with studies of "ideas in context" associated with J. G. A. Pocock, Quentin Skinner, and the so-called Cambridge School. The point of this comparison is to suggest ways in which the historiography of political and social concepts employed by English-speaking peoples might benefit from the insights, methods, and practices of Begriffsgeschichte.

Begriffsgeschichte combines history, social theory, and conceptual analysis in lexicons compiled by teams of scholars. All the teams on one project employ the same investigative protocols, but the protocols vary across projects. Thus, shifts in the meaning of philosophical concepts are recorded in the *Historisches Wörterbuch der Philosophie*, which does not attempt to link developments in philosophy with changes outside of it. Such linkages are central to other Begriffsgeschichte projects, however, and Richter devotes most of his attention to these lexicons, which he describes in considerable detail.

The Geschichtliche Grundbegriffe (GG) focuses on dramatic changes in the language of German-speaking Europe between 1750 and 1850. A historical dictionary, the GG consists of lengthy entries showing how massive political, social, and economic changes were understood by various groups at the time, and how changes in these understandings furthered the process of modernization and made it irreversible. The entries are organized around specific concepts, and Richter includes a list of concepts treated in the GG. He also identifies entries that are particularly strong (bürgerliche Gesellschaft, civil society), or rather weak (Politik, politics). This is useful information for readers seeking entree to a work that fills eight volumes, including one devoted entirely to an index.

By way of demonstrating the value of the GG for political theory, Richter summarizes the changing meanings of Herrschaft uncovered by Reinhard Kosselleck and his team. Richter then suggests that our understanding of Max Weber might be improved by situating his usage of Herrshaft in historical context. This claim involves a discussion of the adequacy of English translations of Economy and Society, and the difference between "authority" and "legitimate domination," two common renderings of *Herrschaft*. Richter points to the semantic superiority of "legitimate domination," and argues that Weber's understanding of Herrschaft was not at all neutral or value-free. To the contrary, Weber's use of the term signaled his position in an ongoing debate over the legitimacy of opposition to political rulers. By suggesting that domination could be legitimate, Weber undercut utopian critiques of state power, which held that consent was the sole basis of political legitimacy.

French philosophes were among the utopians criticized by Weber, and so it is instructive to see how they understood the social and political world of their time. Toward that end, Richter reviews the work of Rolf Reichardt and others in the Handbuch politisch-sozialer Grundbegriffe in Frankreich, 1680–1820 (HB). Entries in this lexicon focus on "how previous conceptualizations of the political and social world were transformed, abandoned, or supplanted during the outbreak and course of the Revolution" (p. 80). These conceptualiza-

tions are construed broadly; they consist of *mentalités*, or pervasive understandings and representations of collective life. Concepts figure in these mentalités, but they are not the focal point of analysis, which further departs from GG in stressing popular rituals and practices over elite culture.

Richter includes a list of concepts treated in the HB, and he identifies Roger Chartier's article on civilité as a leading example of Begriffsgeschichte à la française. A strength of Chartier's work, and indeed of the HB, is the description of changes in whole networks of concepts. Thus, civilité is treated in relation to politesse (politeness), honnêteté (honor), and bienséance (decorum). This underscores the politicization of civilité during the French Revolution; what was once a social grace came to be seen as an essential republican virtue. The transformation was not accidental, since the intellectual battles of the Revolution were fought in, over, and through the terms of political discourse.

The pivotal chapter of Richter's book summarizes the work of J. G. A. Pocock and Quentin Skinner, representing the socalled Cambridge School of conceptual history. The purpose of this exercise is to show how Begriffsgeschichte and projects of the Cambridge School might inform each other. According to Richter, there are no insurmountable differences between the two approaches to conceptual history, and considerable advantages in uniting them. As he sees it, the work of Skinner and Pocock reveals the complexity of political language and its strategic resources at a given moment in time, and is therefore better at "synchronic" analysis. The German project is more systematic, treats a broader range of materials over time, and therefore offers a superior "diachronic" analysis. Put this way, the complementarities seem obvious and Richter advocates for a unified approach to conceptual history.

More specifically, Richter calls for historical treatment of social and political concepts in the English language, that is, a Begriffsgeschichte for English-speaking peoples. He does not say what form this lexicon should take; it could be modeled on Kosselleck's GG or it might resemble Reichardt's HB. Given the differences between these projects, as well as their internal diversity, Richter's agnosticism seems misplaced. Surely, the choice depends on which style lends itself best to a synthesis with the Cambridge School, and for that matter, which variant of the Cambridge School is most compatible with Begriffsgeschichte. For treatment of these issues, readers must look beyond this critical introduction.

The anthology entitled History of Concepts: Comparative Perspectives includes brief characterizations of the major approaches to conceptual history by Kosselleck, Reichardt, and Terence Ball, whose "critical conceptual history" extends the program of the Cambridge School. More or less sympathetic critiques of these approaches are offered by Hans Bödecker, Iain Hampsher-Monk, and Martin van Gelderen. Their essays confirm the existence of broad similarities between Begriffsgeschichte and Cambridge School projects, but they also identify significant differences in historiography and interpretive methods. These differences reflect Begriffsgeschichte's preoccupation with specific concepts and their meaning, whereas the Cambridge School is more interested in idioms that, taken together, constitute political discourse. In light of these differences, readers might be skeptical about the possibility of achieving the sort of grand synthesis or fusion of interpretive horizons proposed by Melvin Richter.

Beyond this, the *History of Concepts* makes two contributions. First, the volume expands our stock of conceptual histories. Thus, Maurizio Viroli describes the origin, meaning, and diffusion of *ragione di stato*, or "reason of state," in seventeenth-century Europe. Hans-Jürgen Lüsebrink shows how the concept of nation, which had republican (and hence

potentially universal) overtones in revolutionary France, was defined in Germany in ethnic (and hence exclusionary) terms. And Willem Frijhoff traces the evolution of "cosmopolitan" discourse in the republic of letters, an intellectual association that originally transcended national boundaries in Europe. All three essays take a broad view of conceptual history, refusing to remain within the confines of a single language or culture. Instead of seeking a unified approach to conceptual history, Viroli, Lüsebrink, and Frijhoff present (or at least anticipate) comparative histories of specific concepts.

The interest in comparison is further served by an emerging history of Dutch concepts discussed in this anthology. The Dutch case does not merely add another tradition to the mix of German, French, and English conceptual histories. As Hampsher-Monk notes, the Low Countries have long been a crossroads, intellectually and commercially. In that sense, Dutch provides a "linguistically open site" that is ideal for investigating the diffusion of concepts in Europe. The diffusion is evident in books and other printed materials, but also in graphical productions used within cultures and exchanged between them.

This is the second contribution of *History of Concepts*. In keeping with current developments in literary criticism, the volume takes a broad view of what constitutes a text. Because images may be "read" and interpreted, there is no particular reason to base conceptual histories solely on the basis of books, tracts, newspapers, and legal documents. Hence, Bram Kempers explores the relation between word and image in Raphael's Vatican Palace frescos, showing how they represent papal power and its intellectual underpinnings. Eddy de Jongh discusses "painted words" in Dutch art of the seventeenth century, arguing that an iconographic reading of genre painting is an important aspect of Begriffsgeschichte.

Also in this vein is Rolf Reichardt's brilliant interpretation of board and card games depicting the logic of events leading to the French Revolution. This is Begriffsgeschichte at its best, constructing conceptual history from materials that were themselves meant to instruct others about concepts and their relation to each other. Reichardt traces the political logic of revolution as it was understood at the time, showing how the mentalité of the ancien régime was undermined by republicans operating within the framework of Enlightenment. Anyone who doubts the value of moving beyond texts when doing conceptual history must confront Reichardt's work.

In The Logic of the History of Ideas, Mark Bevir offers a philosophical account of how the history of ideas ought to proceed in order for its claims to be valid. He outlines the logic of inquiry and forms of reasoning that justify historical interpretation, just as Carl Hempel did for scientific explanation. In that sense, Bevir provides a basis for assessing the adequacy of Begriffsgeschichte and critical conceptual history, although his argument obviously has broader implications for philosophy and the humanities.

Bevir insists that the history of ideas must be conceived as the study of hermeneutic meaning, that is, the meaning of specific utterances for particular individuals. This is not as narrow as it seems, nor as precise as it sounds. The meanings in question might be conscious, subconscious, or unconscious, and the individuals for whom utterances have meaning include listeners as well as speakers, readers as well as authors. Thus, Bevir rejects interpretations that equate meaning with the intentions of those who make speeches, write books, or create images. But he also argues that contextualist and conventional accounts of meaning are incomplete insofar as they neglect the particular meanings associated with specific utterances or expressions of belief. For this reason, Bevir criticizes Pocock and Skinner for not providing philosophical accounts of meaning rich enough to sustain their historical investiga-

tions of conceptual change. Given its structuralist tendencies, the same criticism might be leveled with even greater force against Begriffsgeschichte, although this brand of conceptual history is not discussed in the volume.

According to Bevir, the proper interpretation of hermeneutic meaning proceeds by way of "procedural individualism," which is to the history of ideas what methodological individualism is to economics: a starting point for analyzing the revealed preferences of individual human agents. Under procedural individualism, utterances are treated as expressions of belief, and these expressions are at least initially presumed to be sincere, conscious, and rational. If these presumptions hold, specific beliefs may be apprehended by placing them within a web of beliefs, and a web of belief may then be understood in terms of its relation to an intellectual tradition. The result is what Bevir calls "synchronic explanation," which ostensibly preserves the sense of specific utterances or expressions while embedding them in larger configurations of meaning.

For Bevir, "diachronic explanation" proceeds by revealing dilemmas, which arise when individuals accept as authoritative new meanings that pose questions for their existing web of beliefs. When existing webs of belief are modified or extended in order to accommodate new beliefs, meaning changes and history unfolds. But how can we recover meanings from the past, or rather, on what basis can we claim to have done so successfully? This is ultimately an epistemological question, and because he denies the possibility of foundational claims, Bevir concludes that historians can only defend their interpretations as being more accurate and comprehensive than others in relation to the agreed facts; as being more consistent in applying standards of evidence and reasoning; and as being more open to criticism and change. All of this has a Lakatosian ring to it, although the argument is less radical when applied to the humanities and social sciences.

Synchronic and diachronic explanation are variants of the dominant form of explanation in Bevir's conception of the history of ideas. Both presume that beliefs are sincere, conscious, and rational. When utterances or expressed beliefs are not sincere, conscious, or rational, a subsidiary form of explanation is required. Insincerity, self-deception, and irrationality occur when people express beliefs they do not hold because they think such expressions will satisfy personal needs or desires. The latter are "rogue pro attitudes," or motives that can be invoked by historians to explain instances of deception, self-deception, or behavior that is evidently irrational.

Bevir's explanation of distorted meaning is strained and unconvincing, which is unfortunate from the standpoint of critical conceptual history. Language is the medium of politics, and the terms of political discourse are subject to dispute. The disputes are generally partisan, and frequently involve insincerity, self-deception, and irrationality. Any philosophical account of the history of ideas that fails to incorporate this dimension of political language is incomplete. An interesting question is whether Bevir's account could be completed without modifying or abandoning procedural individualism and its interpretive presumptions.

Procedural individualism may be too limiting in another respect, as well. In his contribution to the *History of Concepts*, Terence Ball observes that conceptual history often deals with the unintended, but nevertheless meaningful, consequences of action. Even a weakly intentionalist account of meaning will be challenged by such phenomena. In the end, political theorists may have to decide whether the history of ideas ought to be regulated by a postanalytic, postmodern account of meaning that does not, and indeed cannot, countenance extant versions of conceptual history.

**Biology and Political Science.** By Robert H. Blank and Samuel M. Hines, Jr. New York: Routledge, 2001. 183p. \$80.00.

John Strate, Wayne State University

What is biopolitics? The authors are well-published scholars in this field, and their answer to this question supplied in this book should give hope to those who are disappointed with the direction and progress of political science. Many of the questions about politics that biopolitics addresses were first asked by ancient political philosophers, such as Aristotle. The field of biopolitics, however, is only 30 or 40 years old. Over that time the field has strengthened its institutional base. Of equal importance, it has produced a growing body of scholarship in such fields as political theory, comparative politics and international relations, methodology, political behavior and decision making, and public administration and public policy. Unfortunately, largely because the field is interdisciplinary, only a small portion of this scholarship has been published in the major political science journals, so that most political scientists and other social scientists are largely unaware of what this field is and what it has to offer.

Biopolitics is interdisciplinary. Its foundation is the theory of evolution by means of natural selection, proposed 143 years ago by Darwin and Wallace, but substantially amended and updated since then. This theory, I would add, purports to explain the traits of every living thing on planet Earth, H. sapiens included. It has been a very successful theory—nobody has yet observed anything that has contradicted it. Thus, it deserves serious attention by political scientists who want their scholarship to contribute to what E. O. Wilson called *Consilience* (1998), or a joining together of the social and natural sciences.

The authors critique political science for its continued reliance upon the standard social science model. This model, which largely ignores human biology, compels political scientists to search exclusively for social environmental explanations of political behavior. The problem is that this model ignores much of what is known about human behavior from various life sciences, including, among others, biological psychology, ethology, genetics, evolutionary psychology, neurobiology, pharmacology, physical anthropology, and sociobiology. The biopolitics model is an interactional model of behavior that acknowledges the importance of both the genotype and the environment. In biobehavioral biopolitics, the study of behavior proceeds at the micro level and analyzes how the central nervous systems of individuals generate behavior in particular settings. In evolutionary biopolitics, the study of behavior proceeds at the macro level and analyzes behavior and its significance for multiple levels in the hierarchy of life, including genes, individuals, populations, societies, and species. Such explanations are evolutionary in the sense that they identify the function of a behavior or how it contributed to survival and reproduction in the environments

The authors list significant historical developments in biopolitics. The founders of biopolitics include Roger Masters, Lynton Caldwell, Peter Corning, Glendon Schubert, Albert Somit, Steve Peterson, and the late Thomas Wiegele, to whom this book is dedicated. In 1980, Thomas Wiegele established the Center for Biopolitics at Northern Illinois University and invited a number of postdoctoral scholars, including Joseph Losco, Donna Baird, James Schubert, and the authors of this book. A landmark development in biopolitics was the establishment of the Association for Politics and the Life Sciences in 1985. The association's journal, *Politics and the Life Sciences*, is published semiannually. Over the

years, the association has become increasingly international and interdisciplinary.

The authors discuss the contributions of biopolitics to political theory. Most significant here is that biopolitical scholars seek to realign political theory so that it is based upon a scientific understanding of human nature. Although many ancient and modern political theorists speculated about man in a "state of nature," they knew little or nothing about the actual state of nature. Anthropologists know this to be hunter-gatherer society, a form that prevailed for 99 percent of our species' cultural history. Biopolitical scholars, using the methods of comparative zoology, identify politically relevant traits, such as social dominance hierarchies, that H. sapiens shares with those of other primates, such as the chimpanzee. Biopolitical scholars study the causes of political evolution, explaining the transition from simple hunter-gatherer societies to complex nation-states and empires. They examine why the existence of states and bureaucratic structures is problematic, given the centrifugal forces created by human nature and the "free rider" problem. They argue against the idea of inevitable progress. Historically, democracies are uncommon, appear only when numerous preconditions exist, and survive only because of the evolved human capacity for indoctrination.

Biopolitical scholars have used methods borrowed from ethology and other behavioral sciences to study political elites. They have used experimental methods to study the responses of subjects to political elites based upon their appearance, their facial displays, and their speech. They have used direct observation and recording methods, including audio tape recorders, event data recorders, and field notes, to code interactions among, for example, city council members. They have drawn blood samples to analyze the relationship between leadership style and whole blood serotonin. The authors argue that as powerful as interview techniques and survey methods may be, many important things about politics will not be learned from using them.

Biopolitical scholars have focused attention on complicated, salient, and controversial issues that have emerged from technological developments in the biological sciences. The authors identify 26 individually oriented biopolicy issues, mostly involving ethical issues of appropriate medical care and intervention (e.g., assisted reproduction). They identify 12-society-oriented biopolicy issues (e.g., population control), and 11 globally oriented biopolicy concerns (e.g., environmental issues, such as global warming). Existing institutions and political processes have generally done a poor job in dealing with and finding solutions to the multitude of problems linked with these issues. A number of these issues (e.g., global warming, loss of biodiversity, population growth) challenge the very notion of modernity. Can liberal, democratic capitalism and its faith in reason and economic growth be pursued on a global level without threatening the longterm survival of H. sapiens?

The authors make a strong case for biopolitics. They do an excellent job surveying the field and its accomplishments. They offer a sophisticated discussion of methodological issues, including reductionism and determinism. A minor shortcoming, perhaps, is that the authors may overestimate readers' levels of biological knowledge. For example, the book mentions the concept of inclusive fitness without defining it. Although this concept is key to understanding much of social behavior, few political scientists likely have heard of it or understand its significance in this regard. Thus, the book might have benefited from a short glossary. The book is well written and organized. It should be welcomed by political scientists and others who would like to know more about biopolitics and its accomplishments. As the authors argue,

biopolitics has the potential to transform the discipline of political science by providing a theoretical basis for the integration of various fields within political science and also the establishment of closer linkages with the natural sciences.

**Natural Law Modernized.** By David Braybrooke. Toronto: University of Toronto Press, 2001. 351p. \$70.00.

Craig L. Carr, Portland State University

Natural law theorizing, it seems, will not die, even in this socalled postmodern era. For some, apparently including David Braybrooke, this is reason to think that there is something true about natural law doctrine, and in *Natural Law Modernized*, he sets about to convince us of this very point. He thinks that natural law theory, once it is suitably modernized and refurbished in the fashion he recommends, has strengths that may make it preferable to alternative ethical theories, particularly utilitarianism and contractarianism.

Most of the chapters that make up *Natural Law Modernized* have seen the light of day previously, either as published material or as presented papers, but they work well together and readers will find a consistency of argument too often lacking in such collections. Still, volumes of this sort have unavoidable drawbacks, and readers may find themselves wishing for a more thorough discussion of key issues left rather undeveloped and unrefined. The book also contains two essays by students of Braybrooke: "Ibn Khaldun Modernized," by Michael McLendon, and "Natural Law in Classical Chinese Philosophy," by Xiusheng Liu. Both are valuable contributions in their own right and do much to contribute to Braybrooke's argument.

Braybrooke claims at the outset that he has a twofold purpose in the book. First, he wants to demonstrate that the medieval natural law doctrine he associates with Aquinas survived into the modern era and is actually on display in such old friends as Locke, Rousseau, Hobbes, and Hume. Thus, he is skeptical about the familiar distinction between medieval and modern natural law theory, insisting that the fundamentals of the Thomistic notion of natural law were "superseded and lost from sight" in the modern era, but that the theory itself "did not collapse" (p. 17). Second, he wants to demonstrate that natural law theory is modern "because it is current, or deserves to be" (p. 4). That is, he thinks his modernized natural law argument can withstand any objections from contemporary philosophy, including, he hastens to add, postmodernist objections.

Yet this turns out to be a bit of false advertising. Braybrooke's argument is not really designed to demonstrate that Locke, Rousseau, Hobbes, and Hume were closet Thomists; nor does he address the kinds of objections postmodern thinkers are likely to bring against what turns out to be a fairly straightforward defense of a naturalist ethic. Instead, he collects (Braybrooke's word) various elements of a naturalistic ethic from the modern thinkers he engages and then puts his argument in contemporary dress by placing it alongside the argument of David Copp's (1995) Morality, Normativity, and Society.

To modernize natural law, that is, to make it current, Braybrooke thinks it necessary to make it both secular and empirical, and he believes it possible to discover such a theory in Aquinas by foregrounding certain elements of Thomistic doctrine and deemphasizing or ignoring others. A secular and empirical natural law theory, it turns out, is constituted by a set of rules that serve to meet human needs and make possible the thriving of individuals and society. Since prescription is the flip side of description in naturalistic ethics, he thinks it also legitimate to say that these rules ought to be accepted

and followed in order to guarantee individual and societal thriving. The rules gain empirical support by looking to basic human needs and acknowledging their obvious importance for human well-being. Since human beings require basics like food, shelter, and security, it is necessary to build a social support system capable of providing these goods, and the rules necessary for the continued success of this social enterprise are presumed by Braybrooke to qualify as natural laws.

The author finds support for this, first, by comparing Locke with Aquinas and deriving from their respective views the required secular and empirical defense of rules necessary for a thriving society. He finds additional support for the empirical foundation of his argument in Rousseau, but more importantly, he looks to Rousseau in order to build a theory of the common good that supports both individual and social thriving. It is interesting to note that Braybrooke's natural law is neither clearly teleological nor evidently deontological; he balances individual thriving against social thriving without privileging one over the other. Hobbes, again along with Aquinas, helps him generate a laundry list of rules to serve as natural laws, and the discussion of Hume presumably enables him to demonstrate that the natural laws can be considered true, thus supporting the moral realism required of natural law theory.

On the bright side, the book is provocative, engaging, and challenging. Braybrooke deliberately avoids the subject of sexual morality (and the accompanying conservative polemic) that entertains many contemporary natural law enthusiasts, crafting a theory that is both current and curiously liberal. In this regard, his argument does produce the promised alternative to contemporary contractarian and utilitarian ethics, and no doubt many will welcome it as such. On the darker side, the aim of the work is ambitious, and his arguments do not always live up to their promise.

Naturalistic ethics always seem rather slippery to me, and Braybrooke's version is no exception. It seems curious to insist that the natural law is objective and holds similarly for all persons everywhere but can also vary at times depending upon the circumstances. And it seems unhelpful to insist that certain rules are necessary to facilitate individual and social thriving, but not say more either about what this means or why all persons should, after a fashion, think of thriving (and not just surviving) in similar terms. Additionally, his argument presumes a basic egalitarianism; all persons have equal standing under his natural law. This may hardly seem troubling in itself, but in a secularized natural law argument, it would be good to know why we must necessarily see things this way. One worries that perhaps Braybrooke has written his own (conventional) modern liberal egalitarian sympathies back into his natural law—a difficulty that invariably haunts natural law argument—leaving it a good deal less natural than advertised and a good deal less able to fend off contemporary objections as well.

Talking Feminist Politics: Conversations on Law, Science, and the Postmodern. By Eloise A. Buker. Lanham, MD: Rowman & Littlefield Publishers, 1999. 240p. \$60.00 cloth, \$24.95 paper.

The Future of Differences: Truth and Method in Feminist Theory. By Susan J. Hekman. Cambridge, UK: Polity Press, 1999. 173p. \$66.95 cloth, \$29.95 paper.

Alessandra Tanesini, Cardiff University

There are differences between human beings, and some of these differences are, for many, a matter of identity. Some people are men, and some are white. Some people are poor, others are wealthy. These identity-constituting differences are deeply connected with different kinds of injustices. Susan Hekman's main contention in *The Future of Differences* is that a new epistemology is required if we are to acknowledge all these differences (p. 27) and, consequently, address these injustices.

What Hekman fails to acknowledge is that there are many important differences between differences. Some differences are the result of economic injustices: for example, that between rich and poor. Others give rise to cultural injustices. For instance, gay people, whose identity is despised, are on the receiving end of this sort of injustice. Many differences, race and gender for instance, are a mix of the two (see Nancy Fraser, Justice Interruptus, 1997). This distinction is important because Hekman's strategy of deconstruction of dichotomous identities (p. 27) seems appropriate only to those differences that are the locus of cultural injustice. When it comes to poverty, what is needed is economic redistribution. The difference between rich and poor is one we want to erase, through the transformation of the economic system, rather than deconstruct.

There are two different sources to Hekman's claim that politics focused on difference requires a new epistemology. These seem to me to be largely independent of each other, although Hekman does not present them as such. One source is her concern with the epistemological notion of the subject employed in modern epistemology. The second source concerns problems with the methodology of social sciences due to specific features of social reality. I see no reason why somebody who endorses Hekman's approach to the first topic would be moved to agree with her on the second, and vice versa. Perhaps, the two complement each other.

The first topic is familiar ground for Hekman, who has covered it elsewhere (see Gender and Knowledge, 1990). She argues that given the traditional model of the subject, women cannot fully achieve this status. They can stop being women, thereby erasing their difference from men, and become subjects. Or they can be women, and accept the status of nonsubjects. What Hekman advocates is a rejection of this framework and of the notion of subjectivity it entails (Chapter 5). For some, this approach is tantamount to overcoming epistemology, rather than developing a new one. Be that as it may, it is her discussion of this topic that leads Hekman to characterize her position as a third strategy for feminism.

The second topic is developed in detail in the central chapters of this book. Here Hekman argues that respect for differences requires that we accept that there are no overarching social theories (pp. 69, 87) and no universal concepts (p. 87), although there are general categories (p. 53). She deploys Max Weber's concept of the ideal type to develop her methodological approach. There is much that seems correct in Hekman's theory, but I fail to see how it is generated by a respect for differences. Rather, its underlying motivation lies with the awareness that it is hopeless to search for exceptionless laws in the social sciences, and that an important aim of social critique is to illuminate the significances of social reality, rather than to describe facts.

However, we can take these claims on board without accepting some of the further points that Hekman seems to derive from them. For instance, they offer no support to her claim that there is a contradiction between the view that reality is socially constituted, and that some perspectives on that reality are epistemically superior to others (p. 31). Even if reality is not independent of us, there remains a conceptual gap between how we take reality to be and how it is (in its socially constituted ways). Some perspectives are superior to others if they are less prone to error.

In this context, it is significant that Hekman fails to mention a crucial feature of standpoint epistemology against which she

raises this criticism, namely, that the perspectives on social reality that are epistemically privileged belong to people who are crucial to the continuation of the system that oppresses them. They have firsthand knowledge of this aspect of social reality, and that is why they are better positioned to know it. It is quite revealing that this feature of standpoint drops out of Hekman's picture, since it is another instance in which a difference that results from economic oppression is ignored in her account. That said, some of her other criticisms of standpoint's tendency to downplay the importance of differences among women do stand.

In *Talking Feminist Politics*, Eloise Buker is almost exclusively concerned with feminism in the United States. More specifically, her sustained discussions of feminist jurisprudence, feminist epistemology, and postmodernism are intended to foster the development of a novel model of citizenship in the context of North American democracy. Feminist jurisprudence modifies current legal practices so as to help ordinary citizens take women's situations into account when judging what is the just thing to do in a given situation. Feminist epistemology helps citizens become informed about the connections between science and social life. Finally, postmodernism helps one to understand that all social analyses must be contextualized.

Surprisingly, Eloise Buker has very little to say explicitly about differences, since this has become a crucial topic for feminist discussions of political citizenship. What she has to say is, however, revealing. She writes: "If politics can bring together... outsiders... then politics offers ways to connect with others on the basis of a shared humanity that is inclusive.... Such a politics builds community on differences that are to be respected, encouraged, and appreciated" (p. 25). Buker, too, forgets that there are differences that are not to be encouraged. Further, her appeal to "a shared humanity" is problematic. The track record of political definitions of human nature and the human good is, to say the least, checkered. They have often been used to impose on some people the view of humanity held by the dominant group in society.

Buker's claim can perhaps be explained by her seeming to believe that political conflicts can always be settled to the benefit of every group in society (p. 45, n. 25) by means of an appeal to the law. I doubt that this is true. Some conflicts have no resolution. Others have just resolutions that do not benefit all involved. If a group has gained an unfair advantage over others, a just resolution requires that members of that group be worse off as a result. I find Buker's belief in the justice of the U.S. legal system puzzling. I doubt that anybody who keeps clearly in mind the frightening statistics about the number of African American men currently in jail would put such faith in the role of the courts to achieve justice for all women, including those who are poor and those who are black.

I also find Buker's support for current institutions, and implicitly the economic system of which they are part and parcel, somewhat naive. She claims that "banks, factories... and churches, for example, offer organizational structures within which opportunities for citizenship exist and which function better when participants are empowered to act as citizens by taking responsibility for making the organization work better" (p. 28). Claims such as this betray a misunderstanding of the very nature of citizenship. Membership in a group could be a form of citizenship only if, at the very least, the group is constituted to protect and pursue the interests of its members. Factory workers who cannot sack their bosses, but can be sacked by them, are not members of an organization that has been instituted to protect their interests; quite the opposite.

Buker also links her discussion of justice in the context of jurisprudence to epistemological questions. Specifically, she addresses the issues of truth in science and of the justification of ethical claims. In her discussion of this latter topic, she endorses a morality of care, whose implementation depends on the wise judgment of citizens (p. 189). Although she is aware that the implementation of such a position is open to abuse, she seems to be optimistic about its possibilities. I doubt whether the dispossessed will feel the same way.

Cultural Pluralism and Dilemmas of Justice. By Monique Deveaux. Ithaca, NY: Cornell University Press, 2000. 205p. \$35.00.

Becoming Free: Autonomy and Diversity in the Liberal Polity. By Emily R. Gill. Lawrence: University Press of Kansas, 2001. 292p. \$45.00 cloth, \$19.95 paper.

Susan Mendus, University of York, U.K.

What does liberalism imply about our duties to minority cultures, and what do the claims of such cultures imply about the nature of liberalism? These may seem like different ways of asking roughly the same question and, in a sense, so they are. Both formulations invite us to consider the relationship between liberalism and diversity, and both do so in the specific context of group, as distinct from individual, identity. However, and as these two books demonstrate, it makes a difference which question we take as our starting point. Emily Gill begins with a question about the fundamental commitments of liberalisn, and having answered that question, she then goes on to investigate the implications for cultural membership. By contrast, Monique Deveaux begins by asking what justice requires for cultural minorities, and having answered that question, she then goes on to investigate the implications for our understanding of liberal democratic theory and practice.

At first blush, Gill's approach is the more tough-minded of the two. She writes: "(I)n a liberal polity, then, our focus should be on ensuring the existence of a context of choice maximizing the probability that cultural membership will indeed proceed from critical reflection and thus function as an expression of autonomy" (p. 7). And she goes on to insist that diversity is not valuable for its own sake, but only for the way in which it may function in individual lives as an expression of autonomy. Moreover, and intriguingly, she notes how many of those who favor special rights for minority groups do so in the name of individual choice. It is, in the end, neither culture nor community but autonomy that is of central importance. Thus, "membership in some culture is a precondition of any sort of human agency, but membership in any particular community on maturity is an expression of autonomy. My focus, then, is on the nature of the preconditions that maximize the likelihood that cultural membership will represent an expression of autonomy" (p. 88).

For Deveaux, this is not the way it is—or at least, not the way it ought to be. She agrees that many of those who would protect cultural membership do so in the name of individual choice, but concludes that this is a wholly inadequate reason, not least because it may "overlook valuable aspects of cultural membership which not only do not necessarily enhance individual autonomy, but also may actually stand in tension with it" (pp. 121–22). And what this, in turn, highlights is both that autonomy-based liberalism may be restrictive in the kinds of groups it will be willing to support, and (yet more worryingly) that autonomy-based liberalism, even when it favors the protection of some groups, will do so for reasons that fail to resonate with members of those groups themselves: "[M]embers of minority groups (especially more traditional

ones) by no means unanimously affirm the ideal of personal autonomy, nor do they necessarily accept it as the overriding reason for introducing special political arrangements to support their way of life" (p. 132). The argument from autonomy is a distinctively liberal argument and, as such, it will not necessarily find favor with members of minority groups themselves.

In assessing these two approaches to the question of diversity, much seems to hang on which way round we ask the initial question. Are we taking liberalism (suitably defined) as the fixed point and then asking whether and to what extent it can accommodate cultural commitment, or are we taking cultural commitment as the fixed point and then asking whether and to what extent its demands can be incorporated within the liberal framework? One might think that these different approaches would result in quite distinct policy provisions: Gill's emphasis on autonomy seems, at least prima facie, to imply a rejection of groups that are not autonomy-valuing, while Deveaux's emphasis on the intrinsic value of cultural commitment suggests a more sympathetic response to illiberal, or nonautonomy-valuing, groups.

However, these expectations are only partially fulfilled. Both writers discuss the implications of their theoretical views for practical policy, and both consider cases in which members of minority groups that place a low value on autonomy wish to remove their children from the state education system. On these, Deveaux concludes that "many traditional religious and ethnic communities that do not actively encourage or foster their members' capacities to form and pursue independent life plans may still deserve respect and protection. As the examples of Muslim schools and the Amish opting out of mainstream education show, there are reasons to support some traditional cultural structures that sit uneasily with liberal sensibilities. At the very least, there are no good grounds for rejecting such practices in advance of extensive public deliberation with the cultural groups concerned" (pp. 135–36). Deveaux does not give an exhaustive explanation of her reasons for thinking that such groups are worthy of respect, but simply contents herself with the general reflection that insofar as they do not jeopardize or restrict their members' capacities and opportunities to make any decisions about their own lives, they do not risk violating democratic principles. To that extent, we must suppose, they are to be permitted, and to the extent that they provide contexts for the development of a sense of identity and belonging, they are to be encouraged.

What, then, of Gill? Her insistence that cultural membership should proceed from critical reflection and thus function as an expression of autonomy strongly suggests that she will have no truck with those cultural groups that reject autonomy, and no sympathy for those who wish to remove their children from state education. This conclusion would, however, be too quick. In her final chapter, Gill insists that "in spite of Rawls's attempt to avoid education for autonomy, I do not believe that eschewing this kind of civic education is compatible with liberalism as I interpret it" (p. 219). But she immediately goes on to acknowledge that this insistence leaves untouched the central dilemma of how to offer a civic education that does not force autonomy on those who are indifferent to it or reject it altogether. In the end, therefore, she reluctantly concurs with the court decision in Wisconsin v. Yoder because "separation is not instrumental to being Amish but is intrinsic to and constitutive of what being Amish means" (p. 238). More generally, she concludes that as liberals, it behooves us to be aware of the limitations of our own moral categories and to recognize that our own emphasis on self-assessment and selfunderstanding is but one narrative among others. Moreover, this recognition is one that can enable us to develop our own autonomy, by allowing us to imagine living different ways of

life, and by promoting our ability to question, examine, and possibly revise our conceptions of the good. Despite their different starting points, and their different theoretical allegiances, Gill and Deveaux often arrive at remarkably similar conclusions, particularly where matters of practical policy are concerned, and this is both intriguing and reassuring.

Taken individually, each of these books represents a significant contribution to the liberal debate over multiculturalism. Deveaux acknowledges from the outset that her approach is the result of reflection on distinctively Canadian problems, whereas Gill's attention is focused on American cases, and often on American legal cases. Hence, perhaps, Deveaux's concern for examining liberalism through the lens of cultural commitment, and Gill's concern for examining cultural commitment through the lens of liberal individualism. For those who are in need of a thorough, detailed, and sensitive discussion of the varieties of modern liberalism, I wholeheartedly recommend Gill's book. Its command of the literature is hugely impressive, and her ability to disentangle the many threads that go to make up modern liberalism is both instructive and stimulating. Hers is a book that both demands and repays careful attention by the reader, but its sheer detail can sometimes bewilder. By contrast, Deveaux's book is more succinct and her own voice is more clearly audible, but the reader (this reader) is sometimes left wanting rather more by way of positive argument. For instance, Deveaux's criticisms of the liberal perfectionism of Joseph Raz and Will Kymlicka are certainly telling, and she is surely right to emphasize that their appeal to individual autonomy fails to capture communities' own views about what is important in cultural membership, but her own appeal to the value of belonging needs to be spelled out in more detail if it is to do the philosophical work required of it.

To say all this, however, is simply to say that these books, like all books, have the defects of their virtues. It is important to add that in these cases, the virtues are very considerable. If, taken individually, each book represents a significant contribution to the liberal debate over multiculturalism, taken together they offer alternative, yet complementary, visions of the way in which liberalism might develop in the twenty-first century. Put differently, the books are not merely critical but also constructive. They fire the reader's imagination by their anticipations of a liberal polity that can genuinely do justice to minority groups. Those of us who teach in this area of the discipline could do no better than to recommend that these two books be read as companion pieces. They will not fail to spark informed debate in an area where debate is all too common, but informed debate is a rare commodity.

**Constitutional Self Government.** By Christopher L. Eisgruber. Cambridge, MA: Harvard University Press, 2001. 260p. \$45.00.

Mark Tunick, Florida Atlantic University

Christopher Eisgruber takes a pragmatic approach to judicial review. Most judges and scholars would decide whether a branch of government acts legitimately by asking whether its actions were authorized or prohibited by some provision in the Constitution. The common assumption is that during the constitutional convention, states agreed to give up some of their powers in order to establish a new federal government with enumerated powers, at the same time explicitly setting limits both to the federal government and to states. By turning to the terms of this agreement, Supreme Court Justices seek to answer whether Congress, the president, or the state or local government in question acted within its rights. Eisgruber regards such assumptions about state sovereignty as "mysti-

cal" (p. 186). Instead, he would have us question, in deciding whether, say, Congress should be permitted to regulate the possession of guns in school zones, that this is the sort of thing a national government can "do well" (p. 186). Whether it was the intention of those who wrote or ratified the Constitution to give Congress this power is, to Eisgruber, more or less irrelevant.

Eisgruber thus adds another sustained argument against originalist theories of constitutional interpretation to the considerable existing arsenal. His defense of a Supreme Court that has discretion to go beyond the original intentions of the framers or even the conventional meaning of the text is based not only on pragmatic considerations but also on a theory of "constitutional self-government." The idea is that by virtue of the procedures used to select the Supreme Court—nomination by the president and confirmation by the Senate—the Court is best viewed as an institution whose function is to practice democracy by invoking its own best judgments regarding political issues that it is particularly well suited to address (pp. 4, 8, 40, 48). Echoing familiar defenses of judicial review, Eisgruber argues that because they have life tenure and are not likely to have higher aspirations for which they might seek political favors (pp. 58, 60), justices are more inclined than elected officials or the voting public to be guided not merely by interests but by values or moral principles (Chapter 2). While opposing originalism and theories that would have justices strictly adhere to the plain meaning of the text, which is, as many have noted, a futile task, he does not recommend that justices simply ignore the Constitution (pp. 205-6), or exercise unbridled discretion. His defense of judicial review rests on the assumption that justices are best suited to apply discrete moral principles, which he attempts to distinguish from comprehensive principles (p. 170). Justices are ill suited to apply comprehensive principles, which call for assessment of an entire system of social interaction rather than specific forms of government action (p. 171), and should therefore steer clear of such issues as redistricting or the balance of powers between states and federal government, for here the Court is beyond its competency and should leave things to be settled by other political institutions.

The argument that judicial review is a means of selfgovernment hinges on the Supreme Courts being a representative institution, and Eisgruber thinks that the reason we have for thinking this is that the justices are "political appointees" (p. 64). Given the importance for his theory of our accepting the democratic pedigree of the justices, it is troubling that we do not get more in this book than a few paragraphs about how the selection process truly lets us regard the justices as representatives. Eisgruber notes that we could have selected justices through civil service exams, rather than by nomination and consent (p. 65); but if the Court was truly intended to be representative, we could have made it elected—he notes, in a footnote without comment, that some states do this for some of their judgeships (p. 228, n. 86). A detailed discussion on representation theory and the extent to which the nomination and confirmation process manifests the will of the people would seem to be crucial to the theory, but we do not find it here. If the justices were to be truly representative, why not have them consult polls in deciding cases, as Lon Fuller has Justice Handy do in his famous "The Case of the Speluncean Explorers" (1949; reprinted in Harvard Law Review 112 [1999]: 1851-75)? Eisgruber might respond that justices fulfill a special role in democracy of protecting minority rights by appealing to moral principles, and following opinion polls may disable them from fulfilling this role. But if, as Eisgruber argues, justices are no more morally insightful than the people, their advantage being only their disinterestedness (p. 62), it is hard to see why they should

not consult issue polls, as opposed to election results. Fuller artfully contrasts Handy's legal philosophy with a number of alternatives. Since Eisgruber defends a controversial legal philosophy in which judges are guided by their own judgment and do not act merely as agents of lawmakers "now long dead" (p. 205), it would have been helpful had he engaged more of the literature on these alternatives.

There are many examples of Eisgruber thoughtfully responding to counterarguments (see p. 67, for example) and providing fresh and stimulating positions on particular constitutional controversies (for example, his discussion of U.S. v. Lopez on pp. 198-99). But there are also a number of instances where his reasoning is less than compelling. In his discussion of whether there is a constitutional principle that would invalidate state laws restricting sexual freedom, Eisgruber rejects Justice Harry Blackmun's suggestion that sexual liberty is vital to a person's identity. Eisgruber does not think that "kinky sex" is any more indispensable to human flourishing than other pursuits of pleasure that the state may wish to regulate, such as, to use his example, eating raw hamburgers at home (pp. 158-59). Instead, he argues that "what matters is not that people define their identities by having sex, but that they sometimes do so by condemning other people's sexual behavior" (p. 160). The constitutional principle he settles on is that we should be protected against regulations motivated by a desire for social prestige or domination (pp. 160-61), although he does not explain why a legislature's motive should be determinative in deciding whether government coercion is acceptable, and he gets to this principle by making what many will regard as an implausible assumption, that pursuing intimate sexual relations is substantially no more meaningful than the pursuit of gastronomic delicacies.

To take another example, Eisgruber assesses the issue of whether we should defer to state governments on the ground that they are "closer to the people." The view he settles on is that we cannot be sure they are, and that in some ways, local and national governments are less anonymous and unaccountable than state governments. As evidence, he cites an informal survey a law professor conducted of his students that reveals that the students "know less about their state representatives than they do about national and local ones" (p. 193). He recognizes that this is an "unscientific" survey, and so he asks us then to reflect on our own attitudes toward local, state, and national politicians. (When I did this I found myself more aware of state legislators who were threatening to cut my university's budget than of city council members). And as still further support that state legislatures may be more anonymous, he argues that "there are fifty states, and it may not be clear which state any given citizen should watch—many Americans cross state lines every day when they commute to work" (p. 194). But Americans live and work in different local jurisdictions as well, so why infer from the fact that some may live and work in multiple states that they are inattentive to state governments, and why not infer from the fact that a far larger number of people live and work in multiple local jurisdictions that more people are inattentive to local government? Eisgruber may be right that state governments are less accountable than local or national governments, but his reasoning is disappointing. As a final example, he seems to be willing to use the "necessary and proper" clause of Article I as a means to support any sort of power that it would be a good thing to have in the hands of Congress (p. 190), despite its clear stipulation that it refers only to "all foregoing powers" and other powers specifically "vested by this Constitution."

Although these arguments may not inspire confidence, there are a number of examples of sound reasoning and fair consideration of objections, especially earlier in the book. The book is uneven, but it is an interesting addition to antioriginalist theories of constitutional interpretation. Eisgruber articulates what will seem to some a radical view; but just as it would take a much longer review for me to do justice to the way Eisgruber deals with a number of complex issues, including whether his distinction between discrete and comprehensive principles is workable, it would take a much longer book that is more attentive to representation theory and legal philosophy if his view is to amount to a truly convincing theory, rather than more ammunition in a worthy battle against originalism.

#### The Spirit of Capitalism: Nationalism and Economic Growth. By Liah Greenfeld, Cambridge, MA: Harvard University Press, 2001. 541p. \$45.00.

Mark N. Hagopian, American International College

In this book Liah Greenfeld tackles the problem that preoccupied Max Weber in The Protestant Ethic and the Spirit of Capitalism (1930). Like many others, she disputes Weber's claim that modern capitalism emerged uniquely in Northwest Europe because of the attitudes and behavior promoted by Protestant Christianity, especially in its Calvinist variety: The "worldly asceticism" and peculiar form of economic rationality involved spawned an economic system that eventually helped change the world. Critical of this precise argument, Greenfeld is in the Weberian camp in centering the problem where he did and in stressing the differences between modern capitalism and age-old commercial profit making found virtually in all civilizations. Similarly sound is Weber's methodological posture that sees culture, that is, ideas, ideals, and values dramatically influencing the emergence, growth, and durability of economic systems. Those who, like the whole Marxist tradition, maintain that underlying "structural" factors such as technology and environment are the prime movers of history have succumbed to untenable deterministic philosophies. History and social structures, unlike the works of simple nature, are constructed by human agency, which itself is often provided by outstanding thinkers and doers.

Greenfeld applies this open-ended view of history to nationalism itself. Instead of reflecting innate natural qualities as "primordialists" in theory and ethnonationalists in practice contend, nationalism itself is a constructed product of human history. In other words, it is something effected by choice, chance, and accident. However, unlike Eric Hobsbawm and (somewhat differently) Ernest Gellner, she does not see nationalism created or employed to cater to capitalism's need for a homogeneous social organization. Quite the contrary: Nationalism most often promoted capitalism as a chief component of its own agenda.

The "capitalism" of which the author speaks is influenced by the classic ideas of W. W. Rostow. This capitalism is privately owned, profit-oriented economy that features economic growth as a competitive weapon in an international framework. It is a capitalism, moreover, that emerged first and foremost in England, particularly after the Restoration, and then diffused (adopting appropriate cultural variations) to places like France, Germany, Japan, and America. The whether, why, when, and how of this diffusion of the capitalist spirit is the central concern of this book: "The sustained orientation of economic activity to growth, the characteristic 'spirit of capitalism' which makes modern economy modern, owes its existence to nationalism. In general this 'spirit of capitalism' is the economic expression of the collective competitiveness inherent in nationalism—itself a product of the members' investment in the dignity or prestige of the nation"

(p. 473). To validate this thesis, the author devotes a chapter, each to England-Great Britain, the Netherlands, France, and Germany and two chapters each to Japan and America. While detailed analysis of these chapters is impossible here, certain key points likely to cause contention can be at least sketched.

In general, these chapters combine political history, economic history, and the history of economic ideas to illustrate Greenfeld's interpretation of the capitalism-nationalism nexus. In Chapter 1 on England-Great Britain, she deals with the lead-up to and aftermath of Adam Smith's publication of The Wealth of Nations in 1776. She rightly stresses that there is more to Smith's thought than tunnel-visioned apotheosis of laissez-faire. More controversial perhaps is her attempt in Chapter 2 to downplay the Netherlands in favour of England as the locus classicus of modern capitalist diffusion. Accordingly, she denies the nationalist credentials of the Dutch in early modern Europe, even during their fabled late-sixteenth-century revolt against Spanish domination. Countering among other things the old Marxist saw that the Netherlands Revolt was the premier "bourgeois," that is, capitalist, revolution, she charges that the Dutch even later in the seventeenth and eighteenth century "did not choose to become modern" and remained so tied to a narrowly individualist economic ethos that "they were not a nation" (p. 90). Dutch historians will doubtless question this conclusion.

According to the author, a major reason for English success and Dutch failure in producing a modern nationalism is religion. She finds that the Dutch were too mired in religious matters to take this road, whereas the English at least by the time of the Restoration had moved forward to a more secular and authentic national consciousness. Her whole line of reasoning reflects a general underestimate of the role of religion in the development of modern nationalism. Whatever the case with the Dutch, certainly English nationalism was a centerpiece of the era of the 1640s and 1650s (not entirely misnamed the Puritan Revolution). English nationalism was wedded to Protestantism for a long time thereafter.

Chapter 3 discusses France as the "first convert" to the nationalist-capitalist convergence. Here we find that even the early and imperfect "mercantilist" capitalism, as it evolved from simple bullionism to more sophisticated notions of the balance of trade, was intimately tied to nationalistic concerns. Various French thinkers anticipated the type of "economic nationalism" that is the focus of this study. Chapter 4 looks to the roots of German nationalism among the post-Napoleonic intelligentsia. However, German nationalism under the influence of Romanticist thought develops a collectivist or organic version of nationalism that distinguishes it significantly from the more individualistic and civic nationalism of the British. French, and Americans. The culmination of various trends of thought, such as the vast literature of "Cameralism," is found in Friedrich List's extremely nationalistic System of National Economy (1837).

The last four chapters of *The Spirit of Capitalism* examine the emergence of nationalistic economic thinking and public policy in Japan and America. Japanese economic development in the post-Meiji period (1868) truly reflects the conscious attempt to defend the country and "nation" against the clear and present danger of Western domination. In Japan, the connection between a nationalism stimulated by foreign contact and an ancient culture stressing the primacy of the community seems clear. It is nationalism that rather successfully has produced the synthesis of a traditional warrior ethic with the requisites of an economy of growth. The concluding two chapters on America cover such topics as the economic nationalism inherent in Alexander Hamilton's *Report on Manufactures* or Henry Clay's "American System" and the emergence of economics as an academic discipline.

This is an important book. It will spark a variety of controversies. Its neoconservative orientation will antagonize those left of center. Area specialists and historians, as is their wont, will fasten onto whatever errors of omission or commission a book of such scope is bound to incur. Students of nationalism will question this or that historical or conceptual point. And yet, the very daring of its central thesis on the connections between nationalism and capitalism is to be commended. Whether it finally lays to rest Weber's strictures on the Protestant Ethic remains to be seen. There is no doubt, however, that a book on an intriguing and important subject, featuring a flexible view of why things happen in history, and also displaying a lively sense of argument and ample documentation, is to be welcomed. It is a powerful and thought-provoking study.

Retrieving Experience: Subjectivity and Recognition in Feminist Politics. By Sonia Kruks. Ithaca, NY: Cornell University Press, 2001. 200p. \$35.00 cloth, \$16.95 paper.

Karen Green, Monash University

Just over 50 years ago, Simone de Beauvoir published The Second Sex, an essay on the situation of women written from the point of view of an existentialist ethic. Her essay had an enormous impact and spawned influential descendants, most of which rode roughshod over the essay's existentialist and phenomenological background. De Beauvoir's great success in The Second Sex was to have described the experience of becoming a woman in such a way as to allow many women to theorize their situation, and she spurred a generation to attempt to change it. Effectively, however, her insights became absorbed into the liberal feminist tradition, and with the rise of poststructuralism, have been criticized for their abstract individualism, commitment to a discredited Enlightenment notion of the subject, and participation in a logocentric philosophy of the Same. Sonia Kruks attempts, in this series of linked essays, to defend de Beauvoir and the tradition to which she belonged from being so quickly dismissed. She sets out the perspective of existential phenomenology and argues for its superiority to the poststructuralist philosophy that has become influential during the last 30 years.

The first essay, "Freedoms That Matter," recaps an argument Kruks first published in the late 1980s that attempts to distance de Beauvoir from Jean-Paul Sartre. Here she suggests that de Beauvoir's account of subjectivity owes more to Maurice Merleau-Ponty, who had developed an account of embodied and effectively constrained subjectivity, than to Sartre, who notoriously asserted in Being and Nothingness that the slave in chains is as free as his master. Kruks appears, in this essay, to be implicitly accepting the feminist and postmodern critique of Sartre, who has been cast as the last defender of abstract universal humanity. She defends de Beauvoir by claiming that despite her protestations to the contrary, she was not simply applying Sartre's philosophy. Although Kruks's reading of de Beauvoir and Merleau-Ponty is nuanced and initially plausible, there are problems with it. It is rather uncharitable to de Beauvoir, since it implies that she misrepresented her own views. It is also uncharitable to Sartre, since it underplays the distance he had already moved toward an account of oppression in "Anti-Semite and Jew."

In many ways, the need to read de Beauvoir in opposition to Sartre is undermined by Kruks's own later essays, in particular the third, "The Politics of Recognition: Sartre, Fanon and Identity Politics." In this essay she points out the neglected debt that Frantz Fanon's Black Skins White Masks owes to Sartre's "Anti-Semite and Jew." Since this work, and its sequel, Wretched of the Earth, had enormous influence on black

and postcolonial liberation movements, Sartre's importance as a political catalyst deserves to be recognized. As Kruks outlines, "The situation of the Jew in Sartre's account is above all one constituted by the anti-Semite—just as that of women can be said to be constituted by the sexist, or that of people of colour by the racist" (p. 92). The first draft chapters of The Second Sex followed soon after the 1946 "Anti-Semite and Jew." So the most economical way of understanding the theory of the subject in de Beauvoir's essay is to see it as developing the account of concrete relations with others, found in Being and Nothingness, in a similar direction to that taken by Sartre in "Anti-Semite and Jew." The crux of this interpretative issue seems to lie in what de Beauvoir meant by "a fall into immanence." If we take this to imply loss of status as a conscious being (reduction to an in-itself), then her theory of the subject is clearly not Sartrean. However, if what she means is that women find themselves in a situation that encourages the attitude epitomized by Sartre as love, language, and masochism, and so treat themselves as objects, there is no reason to think that de Beauvoir has gone beyond Sartre's account of the subject.

Kruks's second essay, "Panopticism and Shame: Foucault, Beauvoir and Feminism," points out the debt, also noted by others, that Michel Foucault's account of panopticism owes to de Beauvoir's and Sartre's account of the look or the gaze. It argues that Foucault's notion of the "interiorization" of the gaze is inconsistent with his avowed "no-subject" theory, and urges the superiority of the de Beauvoir/Merleau-Ponty account of the subject, also recently revived by Elizabeth Grosz (Volatile Bodies, 1994), according to which external social conditions effect a conscious interiority, which is nevertheless always bodily. Without some such account of the subject, the experience of oppression and urge for liberation become mysterious. The fourth essay, "Identity Politics and Dialectical Reason: Beyond an Epistemology of Provenance," turns to feminist standpoint theory and argues for the superiority of the account of the practical situated subject, developed by Sartre in Critique of Dialectical Reason, over the description of the situated subject developed by Nancy Hartsock and Donna Haraway. In particular, Sartre gives an account of the way in which individuals are connected through various forms of praxis, and so is able to "avoid the fragmenting tendencies implicit in identity politics, as well as other forms of multipledifference feminism" (p. 127).

The last two essays advocate, in different ways, a return to the phenomenology of lived experience in order to find some commonality among women and to rescue feminism, both from the silencing of those who are outside discourse and from its disintegration into a plethora of different discourses. For such are the theoretical impasses to which poststructuralism has brought us. These chapters form the center of Kruks's own version of phenomenological existentialism, but I found them the least convincing. Her project is one of retrieval. An extremely influential philosophy, the phenomenological existentialism of de Beauvoir, Sartre, and Merleau-Ponty, has been unduly neglected. This is problematic partly because many ideas that are associated with later thinkers have their origins in this philosophy, but their source is not acknowledged. And more importantly, many of the ways in that we think of the phenomenon of oppression, and the paths to liberation that then suggest themselves, are due to the writings of these theorists, yet are not subject to critical scrutiny. As a project of critical self-comprehension, a retrieval of phenomenological existentialism is important. But whether this philosophy can any longer show us the way forward is another matter.

There is, of course, a great deal that could be retrieved from it. There is the early Sartrean notion of bad faith, the middle period attempt to develop an existentialist ethic and give an account of situated freedom, and the later project of a synthesis, always awkward, of Marxism and existentialism. But these are not what appeal to Kruks. It is rather "the commonalities of feminine bodily experience . . . that can inaugurate a concern for others [which] invite us to endeavor respectfully to travel to the worlds of others in fuller and more ambitious ways" (p. 175). But this is at best the threshold of a way forward. If there is one place where poststructuralism has had some success, it is in questioning any simple notion of experience. But even if we concede a shared experience, and are concerned for the fate of our sisters, this does not solve the hard question: What should we do? This question is hardest when Islamic women or Aboriginal women challenge us as Western, capitalist, and colonial. Sartre did attempt to come to terms, in his later work, with the complex structuring of relations of inequality, which can make one bourgeois and black, or patrician and female. He thought we should strive for genuine material equality, and he thought that achieving it would require a revolution. Kruks is silent on such matters, but it is here, I suspect, that both retrieval and critique is required, as we face Sartre's promised revolution in the unexpected guise of a global Islamic uprising.

Kruks's writing is intelligent and well worth reading. Yet in proposing to retrieve existential phenomenology from its recent neglect, she fails to address its limitations. She does not, for instance, demonstrate where Claude Lévi-Srauss's critique of Sartre's distinction between analytic and dialectical reason broke down. So when she advocates a return to Sartre's way of thinking, it is unclear that she is offering a more coherent outlook than the poststructuralist one that developed out of Lévi-Strauss's critique.

Joseph Schumpeter's Two Theories of Democracy. By John Medearis. Cambridge, MA: Harvard University Press, 2001. 263p. \$45.00.

Jeffrey C. Isaac, Indiana University

Joseph Schumpeter's "elitist" theory of democracy has been the subject of much discussion in political theory. It is commonly considered to have been seminal for the "empirical" approaches to democracy that emerged in American political science after World War II. In this excellent book, John Medearis presents an impressive, careful, and relatively comprehensive account of Schumpeter's writings on the topic of democracy. He argues that Schumpeter has been widely misunderstood, and the richness of his thinking has been wrongly reduced to the chapters of *Capitalism, Socialism, and Democracy* (1942) in which the "elitist" theory is developed.

According to Medearis, Schumpeter had not one but two theories of democracy. The later, and more famous, theory identifies democracy with a method of electoral competition whereby political leaders are selected by those over whom they rule. Medearis argues that this theory needs to be understood as a response to an alternative, "transformational" conception of democracy that was central to much of Schumpeter's early political writing. The "transformational" view, on Medearis's telling, stresses "the importance of democratic beliefs and ideology" and highlights "the radicalizing, dynamic effects of movements that attempt to realize democratic values and act on democratic ideologies" (p. 4). On this view, democracy is egalitarian and expansive theory and practice not reducible to a method of leadership selection.

Medearis charts Schumpeter's encounters with this more radical, transformational conception, first in post-World

War I Austria, where he participated in public debates and discussions about the council movement, the socialization of large-scale industry, and the prospects for democratization; and later in the United States, where he observed and commented upon the industrial radicalism of the New Deal period. The best part of the book is the dialogue that Medearis establishes between Schumpeter and the seminal Austro-Marxists Otto Bauer and Karl Renner. Here, Medearis accomplishes two important tasks: on the one hand, emphasizing the impact of the theoretical and programmatic arguments of these writers, and of Austrian Social Democracy more generally, upon Schumpeter; and on the other, foregrounding Bauer's important and overlooked views on the topic of democracy and its various political embodiments. Medearis locates Schumpeter's own views on these topics within the tradition of conservatism broadly understood. And he compares Schumpeter's views with those of Max Weber, Gaetano Mosco, and Wilfredo Pareto. But he also makes clear the extent to which Schumpeter's aversion toward radical conceptions of democracy was rooted in his own early career as an Austrian "Tory democrat" linked to the Austrian Christian Social Party.

What emerges from Medearis's account is a view of Schumpeter as a complex, transplanted, Central European scholar and public intellectual deeply engaged in the political debates of his time and place. Such a view is a far cry from the way in which Schumpeter has been received in the American academy. This contextualization of Schumpeter is an important accomplishment. But Medearis goes further, engaging Schumpeter's texts, especially Capitalism, Socialism, and Democracy, in careful critical argument, and linking the limits of Schumpeter's "elitist" conception of democracy to the residues of the transformational view that remain in his later work and that, according to Medearis, must be central to any adequate account of democracy. In developing these themes, Medearis does more than shed new light on Schumpeter. He contributes, albeit indirectly, to current debates both about the limits of public choice approaches to democratic theory and about the meanings of democracy.

I highly recommend this book for what it accomplishes, for the conception of political theory that lies behind it, and simply because it is a very well written book that makes an enjoyable and informative read. It is an ambitious book, covering many aspects of Schumpeter's intellectual biography, and shedding light on all of them. There are places, such as digressions on Schumpeter's gendered language and on his anti-Semitic proclivities, where it loses focus. The book also suffers, in a very minor way, from a certain rhetorical slippage that occurs whenever Medearis maintains that Schumpeter "had" two antithetical theories of democracy. What Medearis in fact argues is that Schumpeter recognized two conceptions of democracy, attributed much causal power to a radical view, acknowledged its impact on events, and sought with intellectual and practical ingenuity to oppose it. It is true that Schumpeter "had" a transformational theory of democracy in the sense that he recognized the reality of this theory. But in another way, it is misleading to say that he had this theory, because to say this implies that he subscribed to this theory, and Medearis is clear that he did not, ever, identify with the transformational view. There are places in the book where greater semantic clarity about this point would have enhanced the argument. But, overall, the argument is clear, and Medearis, by delineating Schumpeter's understanding of the transformational possibilities of democracy, has done a great service to all interested in either intellectual history or democratic theory.

Political Nature: Environmentalism and the Interpretation of Western Thought. By John M. Meyer. Cambridge, MA: MIT Press, 2001. 210p. \$55.00 cloth, \$22.95 paper.

John S. Dryzek, Australian National University

Nature is political, John Meyer argues, because it constitutes people and so their politics; moreover, interpretations of nature can only be controversial and so contested. Meyer is an environmentalist who believes that contemporary theoretical thinking about politics and the environment is mostly mistaken. Environmental philosophy, in particular, is criticized as involving wasted effort because it emphasizes justifications for intrinsic value in nature. This emphasis implies that the political challenge is one of convincing enough people to adopt some ecologically benign worldview. But as Meyer rightly points out, most people already evidence a vague commitment to environmental values, and so the real question is how to activate such commitments.

Though not as plentiful as environmental philosophy, environmental political theory is today growing in quantity and sophistication (as Meyer grudgingly admits). But he condemns it for being dominated by two fallacies. The first is dualism: the idea that most political theorists throughout the ages have portrayed humanity in complete isolation from nonhuman nature, such that the task for ecological political theory is to overcome this separation, and re-embed politics in ecosystems. The second is derivation: the idea that a normative model of an ecologically sound polity can be derived from a model of how nonhuman nature works. Derivation tempts those green theorists who believe that the problem with the world is its current domination by a mechanistic model of nature, which ought to be replaced by an ecological model. While Meyer chooses his targets well, these fallacies are perhaps not quite so universal among green theorists as he suggests.

Meyer does discuss dualism and derivation in his contemporaries, but spends much more time on their roots in the history of political thought. Most of the book is devoted to Hobbes and Aristotle. This material is very effective. Meyer takes aim at the major interpreters of Hobbes and Aristotle who have discerned either dualism or derivation in these two thinkers, and finds such interpretations mistaken. Instead, Meyer argues, in their very different ways, both Hobbes and Aristotle share the basic idea that nature (with both nonhuman and human aspects) helps to constitute who we are as political beings, though as pre-ecological thinkers, neither could have thought in terms of ecological nature. This move, then, "allows us to place questions related to nature at the center of our political agenda" (p. 125), which is fair enough. Meyer has undoubtedly made a major contribution to the (environmental) history of political thought. But in light of the intentions with which he began, the big question is: How can these interpretations of Hobbes and Aristotle inform contemporary environmental political thinking and practice?

The justification for attending to Hobbes is that his mechanistic view of nature is widely seen as underpinning the modernity that some ecological theorists want to supersede. (Aristotle, for his part, represents a teleological alternative that may be attractive to some greens.) But showing that Hobbes himself is not a simple dualist or derivationist is really not decisive, if it is the misinterpretations of him that are both dominant and consequential—and are consistent with the modernist paradigm that begins in the seventeenth century. In short, even if Meyer is right about Hobbes, it may not matter much.

Another difficulty arises in that our world is separated from that of Hobbes not just by the ecological thinking that begins in the twentieth century (which Meyer analyzes) but by Darwin. If, as Meyer believes, nature helps constitute humans, then surely nature as revealed by evolutionary biology has a part to play in this constitution, even if that part is contested. Moreover, if Meyer really wanted to take aim at "derivative" misuses of nature in political theory, he could have targeted (or at least mentioned) all those who over the past century and more have argued that Darwinian nature justifies their preferred political project. Unregulated capitalism, dialectical materialism, (eco-)anarchism, progressivism, liberal democracy, organic statism, and Nazism have all been justified in Darwinian terms—often to extremely important political effect. "Darwin" and "evolution" cannot be found in Meyer's index.

At the end of the book, Meyer turns to a brief discussion of the implications of his constitutive view of political nature for the theory and practice of environmental politics, especially in terms of a politics of experience and place. His view of environmental politics is expansive in seeking to escape the idea that "the environment" is just an issue area, and inclusive in the kinds of movements and viewpoints that he wants to draw into the conversation. The movements he applauds are those for environmental justice in the United States, "ecological resistance" in the Third World, and—more surprisingly—the Wise Use Movement in the western United States. He defends the latter as a movement to maintain "a dignified rural existence" (p. 151). But how can a movement that can see this existence only in terms of traditional and unsustainable (on any definition) extractive resource use be described as "environmental"? How can a movement that demands heavy taxpayer subsidy of a rugged individualist antigovernment lifestyle be described as "dignified"? It is not hard to see what sorts of political uses might be made of an environmentalism that rubbishes ecosystemic thinking and praises the Wise Use Movement. Unfortunately, Meyer does not leave himself space to mount an adequate defense, discussing each movement in around three pages.

Political Nature is a landmark in the environmental history of political thought, particularly compelling in its analyses of Hobbes and Aristotle. Whether contemporary environmental thinkers should accept the lessons that Meyer draws for them is an altogether different question. He has plenty to do in terms of spelling out exactly what he has in mind for contemporary green political theory and practice, although he has demonstrated the ability to both unsettle established thinking and raise an original voice in some important debates. His real work has just begun.

# **Taylored Citizenship: State Institutions and Subjectivity.** By Char Roone Miller. Westport, CT: Praeger Publishers, 2001. 224p. \$66.00.

Stephen Schneck, Catholic University of America

Few political scientists would recognize the name Frederick Winslow Taylor. Yet by Char Roone Miller's analysis, Taylor's early-twentieth-century "scientific" reforms in management and administrative practices play out in a ubiquitous and subtle process that shapes citizenship in modern America. The application of Taylor-inspired techniques to the reform of the military in the mid-twentieth century and their curiously parallel application in educational reforms receive Miller's closest attention. Much in the spirit of Michel Foucault's (1975) Discipline and Punish, Miller is concerned with demonstrating that ostensibly progressive efforts at efficient organization effectively routinize the production of consciousness, desire, and even the body.

As Miller would have it, the key feature of Taylorizing is the engineering of fixed citizen identities to be deployed for ulterior purposes: military effectiveness, industrial productivity, consumption, social order, and so forth. Gender, race, intelligence, and other differences are engendered by the Taylorizing process for the construction of these identities.

Well-known societal changes that took place in American society in conjunction with World War II take on an unsettling quality when considered through Miller's lens. Consider, for example, the impact of the procedures of the Veterans' Administration on the education of citizens, on the rise of suburbs, on patterns of citizen participation in politics, on race and on ethnicity, and on everything else. Who could deny that such procedures exercised a profound influence on citizen identity? Similarly, in education the period in question is associated with a number of progressive reforms, including standardized testing, the administrative use of public education for "socialization," sexual education, vocational education, mental and physical hygiene, and civics-all of which might be perceived as moving the formation of subjectivity into the operations of public administration. "Education and military service," Miller explains, "transformed social facts into identifications and citizens into actors." Hence, he continues, "by the World War II period, identities were conceptually organized to support national power" (p. 171).

Miller has a keen eye for discerning the techniques and processes by which societal forces, public institutions, and the state involve themselves in the formation of who we are. At one level, this is not news. A basic premise of social science is the role of societal factors in the formation of identity. Nor is it news to political philosophy, which at least since Plato's deportation of poets has wrestled with the conundrum of citizenship and right. Is there anyone who cannot imagine that school-administered IQ tests or military boot camps do not have implications for citizenship or citizen subjectivity itself?

At a different level, though, Miller's argument really rivets attention. That widespread military experience of World War II and twentieth-century educational reform changed the nature of American citizenry is commonplace knowledge. Social scientists and historians are also aware that Tayloresque management and administrative techniques were widely adopted by reformers in the military and by educational planners, as Miller's superb documentation of the secondary literature outlines. It may even be that such postwar social scientists as B. F. Skinner or Harold Lasswell or a philosopher like John Dewey were even able to connect the dots and recognize the role that progressive institutional reforms were playing in the transformation of the citizenry. But Miller may be the first comprehensively to problematize the process.

Yet while Miller's analysis is pathbreaking, his theoretical argument wobbles at a few points, generally in regard to difficulties with poststructuralism and Foucauldian genealogy. Miller barely raises, for example, the legitimation crisis that his analysis seems to identify. Simply put, if citizen identity is a construction of Tayloresque efforts by the state, then the legitimacy of that state is in crisis if it purports to derive its sovereignty from a free citizenry. While palpably sympathetic with such concerns, Miller cannot easily speak of such a crisis since he thinks, nodding to Foucault, that the idea of a free citizenry is problematic because the citizen is always being made, and is not born. Even "[t]he soul or human freedom is birthed in punishment and discipline," Miller contends. And, while he would prefer that such construction of identity derive from something other than "the highly coercive non-reciprocal power of the state" (p. 174), he denies himself grounds for such preference because he rejects the idea of a

universally authentic human condition, or a human nature, or a teleological purpose for freedom in human life. If freedom and identity are always constructions of power, then the so-called legitimation crisis loses much of its urgency. We are left only to lament the hegemonic power of the state in the process, wishing instead for a multiplicity of powers, and thus grasping at the thin ontology of difference.

The result is unsatisfying. The desire for liberation from relations of power hovers unrequitedly around such thinking. But always the explanation is that we must settle for less, for disturbing the relations of power a bit, for catty satires hoping to unsettle normalizations, or most idealistically for a very small dollop of autopoiesis. Miller's otherwise fine and eye-opening book reveals the author chafing against post-structuralism's tragic wimpiness. The adjectives that accompany his analysis of Taylorism and its effects convey a sense that such techniques of organizational management repress and deform the possibilities of an authentic human existence. Would that he dared to speak of that authenticity and the action and liberation that it begs.

Regardless, *Taylored Citizenship* is an important book. Its potential audience should extend beyond political theory's continentalists to include scholars in public administration, and American politics, as well as educators, historians, and organization theorists. Political theorists, in particular, should benefit from consideration of Miller's compelling use of historical research and his documentation of actual military and educational practices. His mapping of actual policies and practices lends his thesis a compelling rhetorical weight that will surprise theorists who rely only on books and ideas. Finally, *Taylored Citizenship* is a book that needs to be slipped onto the desks of the many who argue for more civic virtue, more civil society, and all who would involve public processes in the crafting of citizenship.

After Politics: The Rejection of Politics in Contemporary Liberal Philosophy. By Glen Newey. New York: Palgrave, 2001. 253p. \$68.00.

Simone Chambers, University of Toronto

This is a very smart book that comes to some very questionable conclusions. Glen Newey takes issue with contemporary liberal philosophy on two counts: Not only does it fail to address the "real world of politics," but it actually aims at the suppression of politics. Included in the list of those guilty of suppressing politics and failing to provide "philosophical reflection on politics—at least not on politics as it is" (p. 15) are John Rawls, Jürgen Habermas, Brian Barry, Joseph Raz, Michael Walzer, Michael Sandel, Will Kymlicka, Amy Gutmann, and others. Clearly, a great deal hangs on what Newey means by "politics as it is," and I will say at the outset that I found his definition wholly unconvincing. But along the way, Newey says some very intelligent things about the leading lights of liberal political philosophy. The book has two layers. In the first, Newey takes up particular philosophical arguments embedded in various liberal theories. At this level he shows us his considerable analytic skills in carefully argued, if somewhat technical, investigations of philosophical weaknesses. So, for example, his discussion of moral internalism and its problems is very good, as is the discussion of neutralist side-constraint as an insufficient reason requirement. Anyone interested in really looking under the hood of contemporary liberal philosophy can get something out of this book. But when Newey moves to the second layer, he tries to tie all his various arguments together under one big claim: the rejection of politics claim, and this is problematic.

When Newey says that contemporary liberal philosophers reject politics, he has, of course, a particular idea of politics in mind. He starts from three "uncontroversial assumptions about politics": 1) politics is characterized by endemic disagreement about what counts as politics; 2) politics is characterized by endemic disagreement over those things we have decided count as politics; and 3) politics essentially involves the use of power (pp. 7-8). None of the philosophers that concern Newey would disagree that all three of the things mentioned are central aspects of politics. So where is the problem? It really comes down to the third characteristic. Newey assumes but never defends what could be called a Machiavellian view of politics. Politics is down-and-dirty conflict in which power and contingency are the two most important factors, not norms and rationality. He does not say this is an aspect of politics that has not been given enough attention by contemporary liberals (a perfectly reasonable criticism to make). He says this is politics, and therefore they have nothing to say about it.

Let's call Newey's view of politics, politics.<sup>1</sup> The first thing to note is that his book is no more about politics<sup>1</sup> than are Rawls's Political Liberalism (1993) Barry's Justice as Impartiality (1995). Indeed, I will argue that it is a good deal less about politics<sup>1</sup> as the arguments are highly abstract and are about texts that are themselves once removed from politics.<sup>1</sup> However, as I have no problem with political philosophy being once even twice removed from politics,<sup>1</sup> I will not pursue this line. I want to make two points. The first is that politics<sup>1</sup> is a problematic or at least controversial view of politics. And second, even if we were to accept this narrow definition, it is not true to say that theorists like Rawls, Habermas, Barry, Raz, et al. are not interested in politics<sup>1</sup> or wish for a world in which we have overcome politics.<sup>1</sup>

According to Newey, political philosophy should offer philosophical explanations of politics. We should be taking the world as it is and trying to understand and explain it. Contemporary liberalism, in contrast, is really a branch of ethics or moral philosophy. Now this is true. There is a set of mainstream liberal theory (which hardly covers all of political theory, let alone all of liberalism) that has taken an ethical turn, and we might want to lament this. Perhaps we need more would-be-Webers and fewer would-be-Kants. But this is not to say that people like Rawls and Raz are not really political philosophers because they do moral philosophy. Newey can say this only because he draws a rather pedantic disciplinary line between moral philosophy and political philosophy. This line reflects a more significant distinction between ought and is: For Newey, ethics is about ought and politics is about is, and the two apparently have very little to do with each other. This is neither the time nor place to get into the is/ought distinction. Suffice it to say that Newey's view of the study of politics as being wholly separate from the study of ethics needs more defense than is offered; indeed, I was unable to find any defense of this view. It is treated as uncontroversial. Certainly Aristotle (someone Newey claims to admire) thought that politics was a branch of ethics. But Newey points out that Aristotle, at least, joined his ethics with sound "empirical considerations" whereas contemporary liberals do not. But Newey suggests no sound empirical considerations that should be addressed, except perhaps the consideration that the real world does not operate along perfectly moral lines. A point not lost on most political philosophers. In fact, the philosophical works cited by Newey all contain empirical considerations, claims, arguments, and observations. We might disagree with considerations or find them false or irrelevant. But to pursue this line of argument one would have to enter into a discussion about the truth or relevance of facts about human beings, and Newey never does that.

One empirical consideration that, like Aristotle, interests most of the people on Newey's list is the way institutions shape and inculcate behavior and contribute to political stability. But is this really politics? Newey says no. Political design, he says, is not political. Political design might not be political in the sense that running for office is political or maneuvering oneself through a messy power struggle is political, but it is political in the sense of pertaining to the public pursuit and organization of the good life. Lets call this more Aristotelian view of politics, politics.<sup>2</sup> It might very well be the case, as Newey implies, that we will never achieve the perfectly good life; we might always have things to fight about. Indeed, part of what it means to be human and to live in organized society is that we have things to fight over. So politics1 is always with us. And Rawls, Barry, Habermas, Raz, et al. are all intensely interested in politics. It is precisely because they recognize the endemic nature of conflict/power that they pursue a strategy of political design. What is the difference between politics in contemporary America and politics in Renaissance Italy? The difference is the institutional framework through which actors chase after politics.<sup>1</sup> The study of institutions (how they are and how they ought to be) has always been a part of the study of politics. And I see no reason to exclude it now. Furthermore, one cannot get a grasp on politics<sup>1</sup> without a firm grasp of politics<sup>2</sup> because one needs to know the rules of the game to understand the game. Are the rules of hockey not part of the game of hockey because the rules do not smash each other against the boards, or because players break the rules, or because the rational justification for the rules are not always the factor motivating players? The rules and the reasons that we might want these rules rather than other rules (or no rules) are part of the game of hockey, just as institutions and norms (and their justifications) are part of the game of politics. And although liberal institutions are designed to constrain and circumscribe conflict, they are not designed to do away with conflict.

All these thinkers can be criticized for taking certain things off the political agenda that we may feel should be left on that contentious agenda. That is a good criticism of liberal theory. Saying that liberalism is interested in doing away with politics because it is primarily interested in the rules that constrain and limit conflict and power is a bad criticism.

Sex and Social Justice. By Martha C. Nussbaum. Oxford: Oxford University Press, 1999. 488p. \$45.00 cloth, \$17.95 paper.

Women and Human Development: The Capabilities Approach. By Martha C. Nussbaum. Cambridge: Cambridge University Press, 2000. 334p. \$28.00 cloth, \$20.00 paper.

Nancy J. Hirschmann, Cornell University

These two books by leading U.S. philosopher Martha Nussbaum take up the issue of women's inequality in a U.S. and international context. Both are hard-hitting, in Nussbaum's characteristic take-no-prisoners style, setting out a clear case that women endure ignominious oppression in the name of culture and religion, and that feminists and liberals alike should tolerate it no longer.

Sex and Social Justice is a collection of previously published essays (with the exception of one on American feminism, which includes an effective and, to my mind, accurate critique of Christina Hoff Sommers), that have been revised to various degrees, on a diversity of topics loosely relating to the issues of sex and equality. The essays range from gay rights, to prostitution, to Virginia Woolf's To the Lighthouse, to cultural relativism. Nussbaum considers feminist theory's often hostile, and always ambiguous, relationship to liberal-

ism, and particularly the ways in which liberal ideals, though so frequently excoriated by Western feminists, are of central importance to women and feminists in the developing world; the unacceptability of female genital mutilation and the failure of Western liberals and feminists alike, so concerned to respect cultural difference, to stand up for women and criticize this practice; the use of Plato in considering Colorado's attempt to legislate against any policy or law that recognizes homosexuals and lesbians as protected categories entitled to rights; and the moral implications of the economic relations of the sex industry. The essays are all well reasoned and argued, but taken together they do not add up to much of a thesis or argument, except for a general multipronged defense of liberal human-rights values. A heavy book by empirical standards—weighing in at almost 500 pages—it covers a lot of ground but does not offer much depth. It is well written and an easy read, however-some of the essays were published in popular media outlets, such as The New Republic and the Boston Review, others in academic journals and volumes. The essays on international issues were more thought provoking and original than those on U.S. issues, in my opinion; the latter, though well written and often persuasive, covered familiar territory and dic not stimulate me to think about these issues in particularly new ways. But this is a good book for those who want an introduction to, or survey of, Nussbaum's recent thinking on popular issues.

By contrast, Women and Human Development presents a controversial and powerful thesis that Nussbaum seeks to develop in a systematic way in order to capture the readers' attention and engages them in a thoughtful dialogue. Originally delivered at the Seeley Lectures at Cambridge University, and originating in a World Institute for Development project on international development, Nussbaum's argument is informed by the empirical experiences she had in the field. Guided by many of the same general concerns as Sex and Social Justice, Women and Human Development seeks to ask more specifically whether feminism can develop universal principles that do not contradict feminism's commitment to difference. She argues that the phenomenon of which feminists have been so critical is not universalism per se; rather, it is a conceptualization and deployment of univeralism that is defined by and from the perspective of privilege—gender and class privilege in particular—an "obtuse universalizing" that reduces or ignores difference (p. 31). As a result, respecting "culture," she points out, often ends up meaning respecting men's power to subordinate women, who "lack essential support for leading lives that are fully human" (p. 4) because they are kept illiterate, poor, powerless, and subordinate.

Nussbaum believes that feminists can achieve a different, and indeed more genuine, universalism "framed in terms of general human powers and their development" (p. 7) that is compatible with cultural sensitivity. The key lies in Amartya Sen's capabilities argument, the basic notion that humans have a fundamental, perhaps even "natural," right to a number of basic conditions of life, such as clean water, literacy, conditions for health, work, leisure, and so forth. Nussbaum initially discusses the use of a capabilities approach in several of the essays in Sex and Social Justice, developing a list of 10 "capability functions"—life, bodily health, bodily integrity, imagination and thought, emotions, practical reason, affiliation, other species, play, and control over one's environment—which all humans must have, and which all cultures must provide (SSJ, pp. 41-42). In Women and Human Development, she pursues this idea further. The capabilities argument is not that people have to do specific things to be free, or to constitute themselves as "fully human," but rather that they have to have the ability and the resources to do

these things if they want to. Like Sen, Nussbaum notes the problem of adaptive preferences: People can adapt their desires, preferences, and views to a wide variety of oppressive circumstances; they can be "colonized" to want what those in power want them to want. At the same time, however, both feminism and liberalism demand that we respect agency, the ability of women to make choices. This apparent paradox can lead to self-defeating positions, such as when a victim of domestic abuse chooses to remain with her abuser. Nussbaum says that the only way to negotiate this double-edged sword is to focus on capability, not functioning: not necessarily leaving the abuser (since some women might not want to leave), but having realistic options and resources, such as economic independence and no cultural sanctions, to make leaving a real option. By focusing on capabilities, we have reduced the chance that women will make self-defeating choices, without at the same time coercing women to make the "right" choices.

Women must be able to participate in defining the culture, in affecting its practices and in deciding how a culture operates and develops. Rather than reject universal discourses of human rights, Nussbaum says, feminists should take women's lives as a legitimate foundation for a universal theory of rights. Taking women as a starting point for human rights means not simply that rights apply to women; for after all, as the past two decades of feminist critique have shown us, if such rights are defined from the perspective of male experience, applying them to women might not accomplish very much. Rather, women should be the starting point for the definition of rights: of what rights should be to, of what rights humans should have, of how these rights should be conceived and deployed (p. 34).

While such an argument might seem pretty basic to Western liberals who are dedicated to free choice, within the context of the developing world, and particularly India, Nussbaum notes, this is actually asking for quite radical change. Although she acknowledges that India is incredibly diverse, and has about as much of a "national culture" as the United States, India is one of the poorest countries in the world (138 out of 175 on the Human Development Index [p. 26]), and its dire poverty, widespread illiteracy, high infant mortality rates, shortened life expectancies, poor or nonexistent public utilities, including water, and inadequate medical care, translate into particularly harsh oppression for women and children, through child marriage, dowry murders, and forced prostitution (all of which are legally prohibited, but culturally practiced). In such a context, it is difficult not to agree with her that Western arguments for cultural diversity sound suspiciously like luxuriant whinings of the privileged. Yet Sex and Social Justice suggests that her capabilities argument is even fairly radical for the West, where prostitutes and gays alike are persecuted, in different ways, and denied basic capabilities of control over their bodily integrity; and where women do not participate to the same extent as men, and the poor do not participate to the same extent as the wealthy, in defining the norms that set the parameters for choice.

Nussbaum's call for a new conception of universalism has much in its favor, for despite considerable differences in cultural practice, certain aspects of women's oppression seem too similar around the world. A husband may beat his wife in the United States because his dinner is late, in Afghanistan because she left the house without him, but "the body that gets beaten is in a sense the same all over the world, concrete though the circumstances of domestic violence are in each society" (p. 23). As she argues, "Certain basic aspirations to human flourishing are recognizable across differences of class and context" (p. 31). Her argument that "[c]ultures are dynamic, and change is a very basic element in all of them" (p. 48) is attractive in the ways it opens up the meaning of

"culture" to those, such as women, who are normally excluded. But at the same time, it produces a certain problem of nonfalsifiability: If "the ideas of every culture turn up inside every other" (p. 49), then there is no way to define or differentiate specific cultures. If cultures are changing, flexible, and ongoing, and contain so many different and even possibly conflicting traditions within them already, then just about anything can count as belonging to culture. That does not necessarily make the argument incorrect; it may be the case that globalization has actually produced "the death of culture." But why call women's efforts to change, circumvent, or violate cultural practice a part of culture, instead of resistance to it? Indeed, women often implicitly engage in countercultural resistance even when apparently operating within culture, such as when women's veiling permits them to engage in paid employment.

Because Nussbaum is writing about societies in which many women are extremely poor and have extremely few options, and is seeking only to establish a minimal threshhold of capability functioning, it is difficult to argue that we all would not choose, for instance, to have clean water for drinking and bathing (pp. 113-14). But at the same time, this "threshold," while vital to basic justice, may also be too basic for an elaborate philosophical scheme of universalism. Furthermore, her argument is heavily influenced by the fact that India has a history of colonialism that may have produced a greater compatibility with Western values than other contexts, such as Saudi Arabia or Afghanistan. Finally, her focus on the state and constitutionalism as the way to make sure that the 10 capabilities are provided by society seems unnecessarily limited, given that, as she notes, India already outlaws many of the cultural practices she identifies.

Still, I found myself caught up in Nussbaum's arguments, and when I taught *Women and Human Development* to a seminar filled with antiliberal graduate students, this book gave them a terrific challenge. It is a book that, though perhaps not always right in what it argues, is always extremely good in arguing it. Even those who strongly disagree with liberalism and are strong supporters of cultural diversity and relativism will be forced to confront the questions Nussbaum raises and to think critically about these issues. Political philosophers can ask for nothing more.

Gandhi, Freedom, and Self-Rule. Edited by Anthony J. Parel. Lanham, MD: Lexington Books, 2000. 164p. \$70.00 cloth, \$23.95 paper.

Pratap B. Mehta, Jawaharlal Nehru University

The life and thought of Mahatma Gandhi continues to be a reproach to ideologies and dispositions that produced the horrors of the twentieth century. But his complex legacy suffers from a paradox. His ideas appear to be both necessary and improbable at the same time. To many, Gandhi's thought becomes even more relevant in a context in which the vision of modernity that he critiqued so powerfully has triumphed, the violence that he stood against has become an ineliminable feature of political life, and the practice of freedom has come to be dissociated from the exercise of virtue. But the very same historical momentum that inspires the authors in this volume to turn to Gandhi also seems to make Gandhi an even more distant and unlikely figure for our times. This volume, a product of sincere and careful scholarship, is largely an effort to keep Gandhi's thought alive. It focuses on the central category of Gandhian thought, swaraj (selfrule). Anthony Parel's essay usefully distinguishes between four meanings of freedom for Gandhi: freedom as national independence, freedom as freedom from poverty, political freedom for the individual, and freedom as the capacity for self-rule or spiritual freedom. This typology will provide a helpful initial orientation to readers unfamiliar with Gandhi's thought.

The rest of the essays concentrate largely on the fourth dimension of freedom, freedom as self-rule. Anthony Copley points out that Gandhi's conception of freedom is far from a libertarian endorsement of people's choices, whatever they may be. Indeed, Gandhi's distrust of formal political institutions, his insistence on a "politics of virtue," makes his conception of freedom rather unorthodox and more intrusive than libertarians might accept. In his characteristically thorough essay, Ronald Terchek demonstrates that he understands Gandhi's conception of freedom in terms of autonomy, and he makes a powerful case that Gandhi provides an acute diagnosis of the various impediments to autonomy. Fred Dallmayr's essay shows the ways in which Gandhi's conception of freedom can help us overcome many dichotomies inherent in our current understandings of liberty. Gandhi's conception of freedom straddles both positive and negative liberty, it provides for a personal space without retreating into a debilitating subjectivism, and it makes the idea of social cooperation a part of the conception of freedom. Judith Brown argues that while modern human rights activists have appropriated Gandhi, his philosophical allegiances make him an odd ally of human rights discourses. This is because Gandhi's commitment to the rights of the oppressed did not spring from a commitment to an individualism that is deeply skeptical of ideas of society and humanity itself. Such a commitment underlies modern human rights discourses, while for Gandhi, such rights would have been unintelligible unless framed in the context of a moral universe that exists independently of human will.

Sudarshan Kapur's essay describes the ways in which contemporary Hindu fundamentalism has perverted Gandhian ideals into a collective narcissism. In perhaps the most challenging essay in the book, Denis Dalton gives an account of Gandhi's originality. He argues that in the twentieth century, Gandhi alone made the relationship between ends and means the central question of politics. Almost all ideologies in the last century, including Marxism, anarchism, and even liberalism, have at various times legitimized violence, and Gandhi was alone in making violence the central challenge for political theory. This essay makes useful comparisons with a host of twentieth-century writers on the relationship between ends and means: Trotsky, Goldman, Maritan, Nehru, and so on. But it misses an opportunity to take on the standard objection to Gandhian techniques, namely, that they cannot work in the face of extensive violence. Stephen Hay's essay reminds us of the potential of Gandhi's conception of swaraj, his ideal of empathetic service, and his emphasis on prayer as a political technique.

For readers unacquainted with Gandhian thought, this volume will provide a reliable introduction to his idea of freedom. But it adds little that is new to Gandhian scholarship, in part because most of the authors themselves have published extensively on the subject before. In particular, Parel, Terchek, Dallmayr, and Dalton have been, along with Bhikhu Parekh, responsible for establishing without doubt that Gandhi ought to be taken seriously as a political theorist. But the fact that their essays are such scrupulous renditions of Gandhi's thought also makes them less probing interlocutors of Gandhi's legacy than they might otherwise have been. To return to the paradox I began with, why does Gandhi seem such an improbable figure in the twentieth century? Is it because of our failings or the implausibility of his assumptions? For those interested in furthering the cause of Gandhian ideals, these remain the most challenging questions.

Multicultural Jurisdictions: Cultural Differences and Women's Rights. By Ayelet Shachar. Cambridge: Cambridge University Press, 2001. 207p. \$55.00 cloth, \$20.00 paper.

Bhikhu Parekh, London School of Economics

Liberal multiculturalism contains a tension. It values culture as the source of individual identity and development, and seeks to accommodate cultural differences by granting the relevant groups special rights, exemptions, and, in some cases, varying degrees of autonomy. However, it also values basic individual rights that some of these groups might deny or severely curtail, especially in relation to women. Liberal multiculturalism is therefore faced with a conflict between what it takes to be two important goods, or what Ayelet Shachar calls the paradox of multicultural vulnerability. If it privileges cultural differences, it compromises and even jettisons its liberalism; if it privileges individual rights, it ceases to be multicultural. Is there a way of conceptualizing and organizing society such that both these goods can be realized? Shachar thinks there is, and devotes her thoughtful and well-argued book to outlining and defending it.

Shachar argues that the tension lying at the heart of liberal multiculturalism can be resolved by revising the traditional two-dimensional political theory in two important respects. We should conceptualize political life in terms not only of the state and the individual but also of the cultural group, the third and often neglected unit of moral and social life. And we should not see the state as the sole source of legal and political authority but, rather, as sharing the latter with cultural groups. In such a view, individuals remain the center of moral concern, and are seen as having two kinds of affiliations and being subject to two kinds of authority, namely, the state and the cultural group. Their culturally significant activities are to be decided neither by the state nor by the cultural group alone but by both together.

This principle of joint governance, as Shachar calls it, requires a judicious and mutually regulative division of jurisdiction between the state and the cultural group, institutionalized cooperation between the two, and the freedom of individuals to decide which of them should have jurisdiction over which of their affairs and to opt in and out of their cultural groups. Shachar suggests that such a process of accommodation is not static but transformative, leading over time to a redrawing of the boundaries between the state and the cultural group, a redefinition of their relationship, and internal changes in both. Rather than force cultural groups to make appropriate internal changes, Shachar's strategy relies on incentives and internal pressures. She rightly argues that since different societies have different histories and traditions and face different problems, the principle of joint governance takes different forms in them.

Shachar's book addresses an important problem and is full of rich insights. Taking different human activities, she shows how the principle of joint governance would work in practice and what kind of institutional structure it would require. As she shows, many multicultural societies, including the liberal, have often felt it necessary to resort to some form of joint governance. She critically examines their experiences, highlights their tensions, and offers a more coherent way of dealing with them.

Shachar's approach is not free of difficulties. The individual does not belong to one cultural group, as she generally tends to assume, but to several. She does not say how their jurisdictions are to be civided, and their inescapable conflicts resolved. It is not entirely clear, either, how Shachar decides which matters fall within the jurisdiction of a cultural community and which ones within that of the state. Education of

children, for example, concerns both, and we need to decide whose claims are stronger and trump those of the other. Since she offers no coherent principles, much is left either to the vagaries of the political process or to the political power of a cultural community, and neither is a good basis for redressing the inequality between different groups or for contesting the state's likely oppression of some of them.

The principle of joint governance, on which Shachar heavily relies, rests on the problematic assumption that the state and cultural groups enjoy a broad equality of status. The state represents and speaks in the name of all its citizens, and its authority is consensual and publicly accountable. This is not the case with cultural groups whose "authority" is inherently vague and weak. They and the state cannot therefore be treated as equal. Furthermore, once the state is placed on a par with cultural groups, we have no means of deciding which takes precedence when the two come into conflict. We need a broader theory to help us determine and regulate their respective jurisdictions and authorities, and Shachar offers none. Her approach requires considerable philosophical work if it is to carry conviction.

For Moral Ambiguity: National Culture and the Politics of the Family. By Michael J. Shapiro. Minneapolis: University of Minnesota Press, 2001. 248p. \$47.95 cloth, \$18.95 paper.

Frederick M. Dolan, University of California at Berkeley

Michael J. Shapiro reflects on "the politics of the family" from the point of view of an outlook on political life inspired by "genealogy," an approach originated by Friedrich Nietzsche and refined by Michel Foucault. Although Shapiro would not characterize it quite in these terms, that outlook is roughly as follows. Ideas about political regimes are typically governed by the values of unity, agreement, or consensus. But that is highly misleading. A consideration of how political concepts and institutions come into being (that is, a genealogy of the political, as opposed to a theorization of it) leads to a picture in which disagreement and conflict are as central as consensus and harmony. Words like "authority," "democracy," and "freedom" are continually redefined as people put them to different uses in changing contexts of conflict and interpretation. What they are thought to mean at any given moment will be an incomplete, contested, and on the whole incoherent echo of actual usage. Individuals, too, shape their outlooks by means of clashing and contradictory desires, norms, and perspectives. For this reason, the goals and beliefs that move any actually existing political regime (and any given individual) will typically be ill defined, ambiguous, and amenable to additional equivocation and conflict.

However, our prejudice in favor of consensus makes it difficult for us to remain attuned to all this. Rather than accepting that ambiguity and conflict are normal and trying to identify areas of confusion or disagreement that are troubling for some further reason, we identify conflict per se as the problem and strive to replace it with consensus. This we do by appealing to some putatively "neutral" (hence, universally acceptable) principle. Because (pace Jürgen Habermas) no such principle exists, the consensus is invariably felt to be imperfect, imposed, and therefore unstable. If we were to lessen the intensity of our desire for unity and coherence, however, and accept the essentially conflictual and contingent character of political life, we might discover opportunities to ease the demand for conformity we make on ourselves and others. We could then assume a relationship to political life that is freer, more spontaneous, and more creative. In recent years this perspective, which was outlined in 1887 by Nietzsche in Zur Genealogie der Moral, has informed work by Foucault, William E. Connolly, Thomas L. Dumm, and Shapiro himself.

Accordingly, Shapiro confronts moralizing certitudes about "family values" with the dissonances and ambiguities that feature permanently in all social life but which are plausibly regarded as on especially vivid display in the family. His aim is not to contest the moralizing view with some other judgment but to reveal the extent to which the family's complexity demands an approach to judgment that is altogether more flexible than mere moralizing. He does not neglect classical theories of the family, such as Plato's and Hegel's, and he also deals with more recent commentators, such as Jacques Donzelot, Jean Elshtain, and Christopher Lasch. But most of the book is taken up by a series of comparisons constructed from an immense and colorful variety of cultural artifacts. The novels Shapiro discusses include Russell Banks's Cloudsplitter, Don DeLillo's White Noise, Joe Gores's 32 Cadillacs, Vladimir Nabokov's Lolita, and even Samuel Richardson's Clarissa, among others. Films discussed include Robert Altman's Kansas City, Atom Egoyan's The Sweet Hereafter (an adaptation of the Russell Banks novel), Jim Jarmusch's Dead Man, Elia Suileman's Chronicle of a Disappearance, and such others as Boogie Nights, Boyz N the Hood, The Sound of Music, and Patriot Games. Art Spiegelman's Maus, Aeschylus' Seven against Thebes, and the thirteenth-century Icelandic Njal's Saga share these pages, as do treatments of works by Edouard Manet and Richard Wagner.

Yet Shapiro's approach is not merely eclectic; he is deeply interested in how the articulation of family life responds to the pressures exerted by the various genres in which it is expressed. The ubiquity of genre, he suggests, is an asset rather than a liability. By appropriating, reinterpreting, and rediscovering genres, each new generation enacts its conflicts with its precursor generation, invents distinctive voices, rethinks obligations and opportunities, and in general achieves transformations in our sense of what family life means. The result is a view of the family in which adjustment and contestation are the norm, and the questions are not whether but how the family is changing and how one ought to respond to its metamorphoses.

Shapiro is more than convincing about how the family serves as a symbol for broad ideological conflicts. He shows in detail how saying something about the family can be an act that challenges structures of power and authority. Anticipating the objection that his rejection of "the humanist subject of consciousness" leaves him without a moral foundation, he also asserts that his writing on the family is a challenge to authority issuing from a "democratic ethos" that constitutes the locus of "the political" nowadays (p. 173). I am less certain of the latter claim. The democratic ethos that Shapiro's work is said to sustain is, he writes, "a way of...being open to difference" that cultivates a hospitable attitude toward the strange and unprecedented, along lines drawn from Emmanuel Levinas, Jean-Luc Nancy, and Giorgio Agamben (p. 174). To speak of an ethos is to speak of a way of life rather than a political state. In our world, an ethos can realistically be imagined only as a way of life that individuals are able to choose because they enjoy the freedom from intrusive regulation that is characteristic of a liberal democratic state. So the ethos would depend on a justification for such a state, the received justification being the idea of individual autonomy or self-determination that Shapiro rejects as "the humanist subject of consciousness." In other words, we are invited to imagine autonomous self-determiners choosing to live according to an ethos of openness to the strange and enigmatic. It is not strictly impossible, but neither is there any strong reason to look forward to it. In a modern, affluent civilization the amount and variety of opportunities for fulfillment are vast, most are concerned exclusively with joining like-minded individuals in the pursuit of private interests, and there seems no reason to suppose that arrangements cobbled together in this way will gel into a democratic ethos of the kind Shapiro imagines. It is therefore unlikely that openness to difference is going to constitute the political. It is safe to say that the political will remain where it has been for a long time: in the problems surrounding the rise of the liberal democratic state.

Speaking broadly, this state's main problem concerns the way in which its success has been accompanied by extremes of wealth and poverty, corruption, waste, the moronization of culture, and the destruction of nature. Is this price worth paying, merely to sustain the notion that having the power to decide for oneself how to live is the supreme political value? Merely to sustain the feeling of moral superiority enjoyed by those whose constitution invites them to regard themselves as self-determining agents? Is it really the case that the obscenely wasteful policies of the liberal democratic state must be respected because they issue from the will of a free people? These are the questions today, they are likely to remain, and even if the democratic ethos of openness to difference were to constitute the political—if it succeeded in building organizations capable of contesting the legitimacy of the liberal democratic states—there is, unfortunately, no reason to suppose that it would be better suited to addressing such matters than any of the other perspectives on the horizon.

**Designing Democracy: What Constitutions Do.** By Cass R. Sunstein. Oxford: Oxford University Press, 2001. 304p. \$29.95.

Martin Edelman, State University of New York at Albany

A venerable question has once again become a dominant issue confronting public law scholars. With the collapse of the Soviet Union and the end of the Cold War, ostensibly democratic states have emerged throughout the areas formerly designated as the Second and Third Worlds. The establishment of these new regimes has invariably been accompanied by the promulgation of written constitutions. For public law scholars, this sequence has posed the question of the utility of written constitutions: What, if anything, do these documents add to nation, state, and society?

In Designing Democracy, Cass R. Sunstein argues that "the central goal of a constitution is to create the preconditions for a well-functioning democratic order, one in which citizens are genuinely able to govern themselves.... I contend that a constitution should promote deliberative democracy, an idea that is meant to combine accountability with a high degree of reflectiveness and a general commitment to reason-giving" (pp. 6–7). This is a novel and intriguing argument.

To advance his argument, Sunstein does not engage in an extensive exploration of how constitutions function in most democracies. Except for a few passing references to South Africa and Israel, he discusses only the United States. The book will be valuable to comparativists only to the extent that they buy into Sunstein's theory of deliberative democracy and then seek, on their own, ways to adapt that theory to other nations.

Nor does Sunstein offer a fully developed theory of deliberative democracy. He is content to "link the project of constitutionalism with the notion of deliberative democracy, not to elaborate that notion on its own" (p. 7). Instead, he develops his argument by a series of "case studies" about such issues as secession, impeachment, citizenship, homosexuality, and so on. Every one of these chapters is well worth reading. And while each is illustrative, no chapter fully articulates his argument. What follows, therefore, is this reader's attempt to come to grips with Sunstein's thesis.

First, its novelty. Historically, written constitutions are the capstone of the ages-long struggle to limit arbitrary governmental action. In the immortal words of James Madison: "In framing a government which is to be administered by men over men, the great difficulty lies in this: you must first enable the government to control the governed; and in the next place oblige it to control itself. A dependence on the people is, no doubt, the primary control on the government; but experience has taught mankind the necessity of auxiliary precautions" (*The Federalist #51*). Constitutions are, in Madison's language, a principle auxiliary precaution.

A written constitution has proven to be the most expedient way to regulate the government because it almost always addresses a number of perennial issues: How are the rulers to be selected? How are the rulers to utilize the organs of government to implement policies? How are the people in a country to inform their rulers about their interests and concerns? A constitution identifies the common objectives of the people and their rulers, the procedures that the government may use to enact and implement policies, and the human rights that the government must respect.

Democracy, as a political concept, is highly supportive of a written constitution. Democracy is premised on the idea that the government is the agent of the people, and that for the people to exercise that role they must enjoy a full range of human rights. The various mechanisms and procedures of democracy are designed to ensure that government is respectful of those rights while being responsive to the needs and wants of the people. Historically, those objectives have been accomplished without a written constitution, but most democracies have found it useful to instruct and limit their governments via a written constitution. Thus, all but two—San Marino and the United Kingdom—of the 118 democracies in the United Nations have written constitutions.

As Sunstein notes, the frequently hypothesized conflict between democracy and constitutionalism has not proved irreconcilable. At the conceptual level, democracy need not be confined to simple elected majoritarianism. Like other theorists, he sees a written constitution as a precommitment strategy that incorporates the citizens' willingness to function within predetermined limits in order to protect fundamental rights.

What makes Sunstein's argument distinctive is the way he extends this precommitment argument to incorporate his theory of deliberative democracy. Thus, in the section on "Constitutions as Precommitment Strategies" (pp. 96–101), his first seven points are fairly conventional; his last point is not: "We can also see many constitutional provisions as mechanisms for *ensuring* discussion and deliberation oriented toward agreement about the general good rather than factionalism and self-interested bargaining" (p. 101, emphasis added).

This is the intriguing, fascinating, aspect of Sunstein's argument. Yes, we can, if we so choose, believe that the Framers of the United States Constitution *hoped* to establish a deliberative democracy. Yes, as he notes, "Madison saw differences and diversity as democratic strengths rather than weaknesses, if channeled through constitutional structures that would promote deliberation and lead groups to check, rather than exploit other groups" (p. 97). But that is not the same thing as saying that the American Constitution *ensures* deliberation. Are we to be forced to be deliberative?

To avoid that issue, Sunstein argues that Supreme Courts, when interpreting a constitution, should whenever possible avoid basing their decisions on complete political theories. Rather, they should tend to utilize minimal, incomplete theories—agreed upon principles, really—that decide the

case at hand while leaving the larger issue to be resolved by the people and their elected representatives. But how likely is that to happen in the *deliberative* manner so warmly endorsed by Sunstein's theory of democracy? Even the briefest comparative study would indicate that it depends more upon a nation's political culture than its constitution. Surely there is little in the American experience to support his belief that our political culture encourages deliberation rather than self interest, whether defined as individual autonomy or economic advantage. Nor does the social science literature about the American electorate, Congress, the presidency, our political culture in general—which Sunstein systematically ignores—indicate the likelihood of a deliberative democracy emerging in the near future.

So we are left with an incomplete argument for seeing the American Constitution as supporting deliberative democracy. For all my long-term support of that theory as the preferred way to interpret the Constitution (Martin Edelman, Democratic Theories and the Constitution, 1984, Chapter 11), Designing Democracy is to be valued most for the many insights that Sunstein supplies on the substantive issues he discusses. Perhaps that is enough. After all, it was Justice Holmes who recommended books on the basis of their "apercus."

The Soul of Justice: Social Bonds and Racial Hubris. By Cynthia Willett. Ithaca, NY: Cornell University Press, 2001. 241p. \$46.50 cloth, \$17.95 paper.

Ange-Marie Hancock, Pennsylvania State University

When is freedom possible? In the silence of a shared heart-beat, when desire is not consumed by the wounds of social forces, hubris, or the historical memory of such violations. According to Cynthia Willett, the locus of that desire is in the socially embedded person. She argues that crimes against the individual as a social person constitute political wounds that should be healed via emancipatory love (p. 214).

Overall, this book aims to shift the foundation of moral philosophy from liberalism's autonomous individual to the person "who expresses his or her individuality through the capacity to form libidinous relationships with others" (p. 167). Reclamation of the ancient Greek crime of hubris as a political violation of social relationships involves a pursuit of justice for marginalized groups via protection of the socially embedded individual. Ironically, quasi-biological, psychoanalytic evidence of presubjective individuals is presented as proof.

Recent communicative ethics debates have pitted Jürgen Habermas against feminist theorists like Nancy Fraser and Carol Gilligan. Siding with the feminist theorists, Willett agrees that Habermas's discourse ethic is a necessary but insufficient condition for a comprehensive view of political life (p. 47). Hidden narratives prevent the discourse ethic from satisfying questions of inequality and political alienation. The larger question is how to acknowledge differences in the structure of moral judgment (e.g., between men and women) in a way that does not privilege one structure (rational) over another (care). Habermas appeals to the rational structure, depending on psychologist Lawrence Kohlberg's work, partly out of a desire to find a capacity that all individuals possess, regardless of their usage of it. Gilligan similarly argues that the ethic of care is another capacity present in all—just used predominantly (but not exclusively) by women. If both structures are in fact hardwired into humans, as most psychologists would have us believe, then are not their emergences as gendered predispositions the result of socialization and ultimately assimilable into a single model of moral judgment suitable for the pursuit of justice?

Willett seems to believe so. Arguing for attention to "the forces that make us feel alive and connected," she seeks to insert a counternarrative of justice as a universal consideration in moral discourse. This act would presumably enrich the discussion of social relationships (p. 78) so important to an ethic of care, as well as remedy group-based injustice. For Willett, our social predisposition is another necessary but insufficient condition for addressing global inequalities that cross nation-state boundaries.

The question then becomes, who establishes the parameters of this universal counternarrative and the appropriate response to changing social forces? The "outsider-within" perspective, defined most clearly in Patricia Hill Collins's (1990; 2001) *Black Feminist Thought*, grounds Willett's turn to slave narratives as a useful surrogate for monolithic master narratives like race. Privileging outsiders-within requires an expanded conception of citizenship (p. 92). Left unmentioned is the required concomitant reformulation of state sovereignty, which in a context of global inequality is most risky for countries at the margins.

Willett convincingly supports her assertion that a counternarrative of social justice necessitates a reconstitution of the citizen as a social person, ultimately redefining freedom. This changed definition of freedom implies different social norms and different laws (p. 180). One particular social norm is the prohibition of hubris, exemplified by racial arrogance in chapters on Beloved and Frederick Douglass. Taken from ancient Greece, hubris is "an assault on social bonds" (p. 183), capable of destroying not merely an individual victim but society as we know it. African American writers of the slave experience have translated the notion of hubris into a threedimensional vision of freedom: ideals of freedom and identity attached to the erotic, a concept of the person as a social event, and an approach to restoring freedom via rites of reconnection rather than liberalism's stoic separation. Willett concludes that "we must work instead for the spiritual renewal of social bonds" (p. 185) with authority.

These rites of reconnection are absent where Willett turns—to Herbert Marcuse's theory of eros and freedom, partly due to the problems within Marcuse's original vision. The minor point she makes from her laborious analysis—that motherhood and the social values produced from it point us in new directions for social transformation (p. 117)—is persuasive. Yet Marcuse leads her far away from her larger goal of inserting a social justice counternarrative. Supplementing Marcuse with the psychoanalytic theory she challenges in other chapters, she permits the paternalistic terms of his revolutionary model to proceed unquestioned. In other words, is the kind of revolution Marcuse advocated (student and intellectual led, dependent on technology) a desirable or viable goal in a twenty-first century of globalization?

This Marcuse rehabilitation is ill equipped to empower "those who reside on the other side of the social divides" (p. 69). Freedom, defined as self-determination grounded in relationships with others, prioritizes the need to protect the individual from hubristic market and cultural forces. Yes, people are alienated by the "racialized distortions of social space." In Willett's slave narrative of choice, Beloved, freedom and ultimately empowerment are based upon one's capacity to determine who or what you love (p. 207). Frederick Douglass's writing further implies that self-representation is key (p. 191). Must not we empower those residents of "the other side" to choose modern, "rational" structures in addition to what seems more appealing—neo-Freudian, erotic social bonds? bell hooks's call for "love as the practice of freedom," along with Martin Matustik's vision of a multidimensional dialectic (p. 103), enrich Marcuse's notion of eros and freedom. But hooks in other arenas focuses on the work of Paulo Freire as a springboard for accomplishing just what Willett seeks—bringing those who live on the margins into the center. Freire's empowerment pedagogy contrasts directly with Marcuse's idea of revolution, and would bring us closer to the aspect of self-determination both Willett and other theorists consider a critical component for eradicating group injustice.

This largely convincing account raises important questions for democracy. If we insert hubris codes and a norm of social justice into the discourse, what additional purchase do outsiders-within gain? The question of sanction and recompense for crimes of hubris are briefly explored. Willett distinguishes between hubristic criminals and "those who carried out acts of revenge against the hubris of their oppressors" (p. 192). Contemporary acts of revolt or revolution are dizzyingly complex in an era of Rwandan genocide and September 11. Psychological processes of social judgment focus upon attribution of responsibility for an offense. We often advocate different consequences based on whether we consider the person ignorant, negligent, or having malicious intent. In the ancient world, lack of knowledge that one commits a crime of hubris does not exempt the offender from the consequence. How do we adjudicate justice when, to paraphrase Mahmood Mamdani's evocative title, victims repeatedly become killers in Rwanda? Willett's book sends us in new directions to answer questions with ancient origins.

**Socratic Citizenship.** By Dana Villa. Princeton: Princeton University Press, 2001. 370p. \$65.00 cloth, \$17.95 paper.

Gerald Mara, Georgetown University

The publication of Dana Villa's Socratic Citizenship coincides accidentally with recent events that have shaken and solidified American society. Yet the issues his book addresses are directly relevant to how a democratic society confronts such challenges. Villa investigates various forms of democratic citizenship and argues for a kind of civic activity that has been dangerously obscured within modern debates about democracy. Particularly within periods of regime stress, liberalism's good citizen who votes, pays taxes, and plays by the rules seems underequipped to meet the commitments the times require. The framework of the communitarians or the civic republicans wherein one discovers the value of "a shared commitment to something bigger than one's self... [endorsing a] life of community or civic engagement" (p. x) seems more helpful. Villa's concern is that this view of citizenship too easily enlists the community's members in projects of collective affirmation, while ignoring the importance of a critical rationality that asks skeptical questions about the content and the moral consequences of a politics driven by a "newly rediscovered sense of political membership" (p. x). In response, he rediscovers the possibility of a form of citizenship that places "intellectual doubt at the heart of moral reflection," demanding not commitment but conscientiousness (p. xii). It is this form of citizenship that seems most compatible with moral individualism, and thus with the basic premises of democracy. He plausibly finds the origin of this kind of citizenship in the practices of Socrates as they are portrayed within the early Platonic dialogues, Apology, Crito, and Gorgias.

Villa begins with an interpretation of these dialogues, but his major concern is to reveal the fate of Socratic citizenship within modern political thought. He focuses particularly on five thinkers, J. S. Mill, Friedrich Nietzsche, Max Weber, Hannah Arendt, and Leo Strauss. While all of them take "strong stands on the relevance of Socratic moral individualism to modern politics" (p. 59), they all, to different degrees, understand citizenship in ways that undercut rather

than respect "the Socratic idea of philosophical, dissident citizenship" (p. 59).

The interpretation of the dialogues differentiates and endorses conscientious Socratic dissidence, as compared with the assertive Periclean citizenship promoted within the remarkable funeral speech. Villa's Socrates contests the aggressive agenda of the funeral oration, not in the name of a moral expertise that can discover the truly right way of organizing common life, but out of a more individualized criticism of common ideals guided by the moral imperative to avoid injustice (pp. 24, 58). Socrates' commitment to this imperative is reflected both in his speeches against Polus and Callicles in the Gorgias and in his own behavior as described in the Apology. When he refused to cooperate with the Thirty Tyrants in the judicial murder of Leon of Salamis and when he declined to bring the unconstitutional indictment of the Arginusae generals before the assembly, Socrates essentially invented (p. 1) a model of philosophically dissenting citizenship that has been largely forgotten within modern political thought.

For Villa, Socrates' example has been overlooked due to a broad skepticism about "the viability of a philosophical form of citizenship under the conditions of the nation state and increasingly universal suffrage" (p. 59). It is in Mill's work that the promise of Socratic citizenship comes closest to being fulfilled, within the praise of the activities of thought and discussion and the paean to creative individualism in On Liberty (p. 75). Yet this opportunity is lost (p. 124) when Mill's pessimism about the capacities of the lower classes leads him to endorse political deference to elites (in Representative Government) (p. 122). After Mill, departures from Socratic citizenship become more pronounced. Though Nietzsche is committed to affirming the overman's intellectual integrity, he ends by radicalizing this commitment into a call for the rejection of rationality in the name of the "the myth and value-creating powers of art" (p. 181). And by suggesting that the overman's intellectual integrity is a radically individualized achievement, Nietzsche lays the foundation for the claim that philosophy and citizenship are mutually exclusive.

In spite of the significant differences among Weber, Arendt, and Strauss, Villa sees this last assumption informing all of their positions (p. 129). Weber responds to the disenchanted culture of modern mass society by confining the independence and autonomy that Socrates sought to encourage among all citizens to political leaders (p. 206), who embrace political goals less from thoughtful reflection on political purposes than from devotion to a cause (p. 219). For Villa, the very different projects of Arendt and Strauss are connected in their opposition to this Weberian view of politics and power. Arendt proposes a return to the Periclean ethos of active citizenship whose connection to skeptical thought is at best ambiguous (p. 273). Strauss argues for a certain kind of philosophical politics, where the relevant form of philosophy is not Socratic dissidence but the more affirming and directive philosophy of Plato (of the later dialogues) and Aristotle. This direction cannot be the transmission of philosophic truths through political education, for the city is at bottom resistant to philosophy (p. 294). Thus, good citizenship becomes deference to opinions articulated within a habituating political culture managed by the decent (p. 294). Arendt's Pericleanism and Strauss's Platonism are thus counter-Socratic, for both end by supplanting independent, critical thought.

This book deserves a wide, appreciative readership, both for the importance of the argument and for the depth and breadth of the interpretations that support it. Villa seems right to say that too many proposals for more engaged democratic citizenship discourage the critical distance that allows scrutiny of individual commitments and public purposes. And by calling this critical stance "Socratic," Villa counters the

unhelpful notion that political problems and resources are segmented within "premodern," "modern," or "postmodern" cultural contexts. In making his case, he develops a sophisticated interpretive argument without obscuring the complexities and anomalies of the sources in question. He pursues rather than ignores texts that complicate or challenge his argument, and while the book offers a powerful and important pragmatic message (p. 309), the individual interpretations are all valuable in themselves. There are times when the effort to detect the presence of Socratic moral individualism within these modern texts may lead to exaggerations or understatements. Mill's praise of the self-creative individual in On Liberty seems at least as Periclean as Socratic, in tone if not in content. And the Nietzsche committed to reforming culture appears (pp. 282ff) perhaps later than he should. Still, Villa's overall readings are rich and provocative. Each of the voices heard here is distinctive, yet they all have things to say to one another. He brings both the distinctiveness and the engagements to the fore with admirable sophistication, fairness, and clarity

One might make two more general points, posed less as criticisms than as observations. First, while Villa engages a variety of modern voices, there are others who are less prominent than they might be. Tocqueville plays only a supporting part within the interpretation of Mill, and he is, in general, the conservative Tocqueville, suspicious of the majority and lamenting the demise of tradition (p. 66). But there may also be a need to make room for the critically distant Tocqueville, whose stance on emerging political innovations is far from unidimensional. The more positive (than Weber's) sociology of Jürgen Habermas and its framing theory of communicative rationality are considered only as potential masks for widely shared prejudices (p. 180), as if participatory democracy and communitarianism were identical. One wishes to hear more from Villa on both authors.

Second, this interpretation may underplay ways in which Socratic citizenship is incomplete. Without a more active form of civic involvement, Socratic citizenship may come perilously close to the self-absorbed purity of the beautiful soul (p. 55). Villa finds the benefits of Socratic citizenship in the dissemination of Socrates' skeptical rationality across a broader spectrum of citizens (p. 56), yet this seems inadequate for political contexts where decisions need to be made and actions taken. Thus, even among Socratic apologists, some more active citizen(s) may need to become involved if Socrates' dissolving rationality is to be politically salutary. Socrates' commitment to disconnect himself from the injustices of the Thirty does not do Leon of Salamis much good (p. 26). Within Xenophon's narration (Hellenica 1.7) of Socrates' courageous refusal to bring unconstitutional charges against the Arginusae generals, it is left to the more active citizen Euryptolemus to speak assertively (though unsuccessfully) in support of Athens's own democratic procedures. It is therefore questionable whether the Socrates of (any of) the Platonic dialogues wishes simply to reproduce his own skepticism among the Athenians he interrogates. However, any encouragement to practice politics always seems to acknowledge that active citizenship must accept as settled and salutary some of those conclusions that Socratic citizenship treats as questionable or dangerous. Even the counter-Periclean funeral oration that is represented in the dialogue Menexenus asserts a spirit of Hellenic ethnic homogeneity (245 c-d) that is foreign to thoughtful criticism but perhaps necessary in politics. Critical rationality and citizenship may qualify as well as enhance each other.

There may also be more of a need to address the resources and destinations of critical rationality. Absent some sense of a human good that can be damaged by political assertiveness,

the dissidence of the critical citizen seems more agonistic than reflective. Conversely, the dissident citizen's explaining why certain widely shared views court injustice may lead him or her to discover more about the human content of the just and the good. This need not be a quest for remote foundations; it may simply reflect the need to explore the bases and implications of one's critical judgments. It seems too minimalist to identify the content of Socrates' political rationality primarily on the basis of what he says to Crito or Callicles.

Both forms of incompleteness seem acknowledged within the Platonic dialogues. Villa is reluctant to accommodate these contributions in part because he accepts as conclusive the division between the early "Socratic" (aporetic) dialogues and the later "Platonic" (dogmatic) ones (p. 2). In spite of the long-standing and well-respected scholarly tradition behind this division, its validity is not altogether obvious. The bases of these reservations are less important than the implications. If the Socrates of the *Apology* is continuous with the Socrates of the *Republic*, there may be a sense in which Socratic citizenship (understanding it and trying to practice it) can be enhanced and not destroyed by Platonic political philosophy.

**Augustine and Politics as Longing in the World.** By John von Heyking. Columbia: University of Missouri Press, 2001. 278p. \$37.50.

Joanna Vecchiarelli Scott, Eastern Michigan University

John von Heyking's inquiry into Augustine's politics of "longing" is a provocative contribution to the growing genre of "Augustine redux" literature written to resonate with our fin de siècle sensibilities. These valuable pearl-diving expeditions bridge scholarship and literate conversation, careful textual exegesis and political advocacy. Not surprisingly, they also illustrate the challenges of writing for multiple audiences with mixed messages. This work enters an already crowded field of recent crossover texts with Peter Brown's Augustine of Hippo (2000), Gary Wills's Saint Augustine (1999), Hannah Arendt's Love and Saint Augustine (1996), and Jean Elshtain's Augustine and the Limits of Politics (1995). A further trip back in time to the Cold War and the politics of "realism" turns up Herbert Deane's The Political and Social Ideas of St. Augustine (1963), another retrieval project written to persuade as well as inform. And this is just a very short list.

Augustine's ironic voice paired with the evident fervor of his faith, from the Sermons to The City of God, make as compelling reading today as when they were written. His legacy to worldly philosophers, particularly the political sort, continues to arouse passionate debate precisely because he is such an unexpectedly worldly saint. A dominant leitmotif running through Augustine's classic rendition of decline is the increasing discontinuity between the de jure and the de facto, between justice administered by the institutions of both church and state and the daily experience of individuals living in communities defined, as he famously put it, by their respective "loves." This tension is especially striking in his relentless reportage on the chasm between the founding virtues of the Roman Republic, immortalized by Cicero and Virgil, and the morally questionable loves of his late Roman, largely Christian, fellow citizens. Cleverly avoiding the pitfalls of Manichean dualism, Augustine neither fully damns the Roman state, as had Tertullian, nor fully invests it with a sacred aura, as had Eusebius. Political life for Augustine is always ambiguous.

At one level, the current study also has a message in mind, targeting an audience of "Moderns," predominantly "liberal democrats," who are looking for a way to keep a "regime of

tolerance" from degenerating into a "regime of secularism" (p. 260). Augustine's thoughts are "timely," the author believes, because they relocate human longing for true justice and happiness on a "transcendent" plane of divine deliverance, but make "a civic attitude of gratitude" and moral suasion a crucial earthly component of a pilgrim's progress. At a second level, however, the author presents a nuanced, historically based reconstruction of Augustine's thoughts on public life. His exploration of the word "consul," teasing out as many possible meanings as Augustine himself might have extracted from Roman writers and deployed in his own rhetoric, is particularly interesting (pp. 71–76). These forays into Augustine's literary world are illuminating chapters, rich in linguistic reconstruction and based not only on *The City of God* but also his pastoral writings.

Yet there is a third strategic argument at work. Here the audience is more specialized, confined to the schools of political thought founded by Eric Voegelin and Leo Strauss. Von Heyking's agenda is to rehabilitate the saint's reputation as a Christian virtue ethicist and move him from the periphery to the center of the "cosmion" as a philosopher of natural virtue. The dominant interpretation, inside and outside Straussian-Voegelinian circles, is that Augustine is a political realist when it comes to the scope and limits of public institutions and a Christian moralist with respect to the lives of the faithful. The author quotes Leo Strauss's lament that "there is a valid hierarchy of ends, but there are no universally valid rules of action." Augustine "is thought to fail miserably on this score" (p. 6), the author adds, only because his "rightby-nature" ethics has not been fully appreciated, even by Strauss and Voegelin who mistakenly think Augustine "denies the world's inner goodness." Such dark readings open the door to modernism's inner demons-"millenarianism, alchemy, gnosticism and revolutionary ideology" (p. 13).

Augustine's rhetorical style, which von Heyking calls "extreme" but which, ironically, others have termed surprisingly modern, defies categorization. His signature "cities" of God and man are spiritual communities animating political and religious institutions but mixing mysteriously in the workings of both. Intending his words as a spiritual seduction, Augustine entices his fifth-century readers along a path of reason until they are captured by the powerful Christian faith lurking behind it and drawn into his simultaneous defense of Christianity and of the worldly virtues the Romans were in the process of losing. However, the current study with its trinity of pursuits does not provide the reader with as satisfying a journey. The reason is that its scholarly and rhetorical agendas undercut each other to the detriment of the strongest strand of argument—the author's careful exploration of Augustine's understanding of civic virtue and its importance in the lives of the faithful and nonfaithful alike. The overall effect is to elevate the moral capacity of political, social, and ecclesiastical institutions as reflections of the "longing" for natural virtue on the part of the citizen-faithful as they approach the "ground of (divine) being." Augustine's tragic sense of the conflicting obligations of Christians in public life, and of the mixture of loves among both citizens and faithful members of the church, is not foregrounded. The family, the "city" as a moral community, Voegelin's "cosmion" as a regime or "little world," and actual historical entities such as Rome flow into one another without the friction that often characterized Augustine's writing in the minor key (pp. 174–75).

The thematic core of this study is the metaphor "right-bynature." It is deployed as if it were in common usage among scholars and hence unproblematic. In fact it is neither, except among those specialists who speak the language of Straussian or Voegelinian discourse. The reader must look to footnotes (p. 4, n. 4, and p. 8, n. 12) for its source in an article by James Rhodes ("Right-by-Nature," Journal of Politics 53 [May 1991]: 318-38). Further digging discloses the root of the idea in Aristotle's Ethics. Many scholars might read Aristotle's discussion of physei dikaion in Book V as referring primarily to natural "justice" and not "right" in the modern moral sense. But the author, without extended explanation, renders the phrase as "right," making it a Platonic "natural theology to guide the city" (p. 8). Augustine, in turn, becomes a political theorist of Christianized natural theology. As such, his writings can be used to transform the idea of civic virtue into the "equivalent to the biblical concept of righteousness" (p. 8, n. 12). The operational meaning of Augustine's idea of virtue, the author will go on to explain in the rest of the study, is always specific to local conventional mores. Yet the saint's prudential approach remains firmly anchored to the view that human virtue in the saeculum longs to share in the "nature" of goodness reflected in the universe as God's Creation. By so doing, the author argues, Augustine provides an antidote to "Moderns" who have fallen into "Machiavellism" and "other forms of extremism" because of their loss of faith in the moral possibilities of public life (p. 9).

And yet this is also a work of careful scholarship. Von Heyking demonstrates with more textual fidelity than most Augustinian commentators that the saint mobilized every metaphor at his command, from the family to bands of robbers, to engage his readers in understanding the importance of personal morality, earthly peace, and justice. Emperors and subjects, thieves and pirates, fathers and slave masters are enjoined to establish a worldly order of obedience and rulership for the good of the governed and not just in the service of their own lust for power. The author explores the great chains of analogies summoned up by Augustine to explain to a skeptical Roman-Christian world that "order," whether of peaceful citizenship, human "loves," or nature, is a universally prized good as well as God's intention. As Augustine famously notes, even bands of brigands must have an agreement among themselves about basic practices if their enterprise is to prosper.

What is at stake in this study of the theology of civic virtue is the meaning of "nature." Most of the authors cited here understand Augustine to be periodizing history, with the Fall of Adam, the birth of Christ, and the impending demise of the Roman world as nodal points. For Augustine, institutions of both church and state are not natural in the sense of "original," but are inserted in history as part of God's strategic plan to keep the peace among a population whose loves are decidedly mixed. As a result, tyrants and republicans rule with equal legitimacy. The author, however, places his emphasis on institutions of family, society, and politics as vehicles of moral education. On this reading, they are part of the "natural order" of sociability and personal moral enrichment that began in Eden and continues through the family to social life, to citizenship, and on to religious observance. Augustine's dark vision of the state as the "barbed hooks of the executioner" seems more a rhetorical device than a true measure of the saint's belief.

Yet Augustine-the-Bishop was a Roman by education and sensibility, acutely aware of the different realms of public law and human society, although in his official capacity, he did Rome's as well as the church's work in Hippo Regius. Augustine would always settle for the great gift of peace on earth, even if that required using the Roman Empire to crack down on Christian dissidents whom he considered violent terrorists. For every Augustinian statement about an enhanced moral life possible when Christian public officials rule, most often written in the subjunctive mood, there is an equal and countervailing comment about "submission" to an absolute state that coercively enforces customary loves, whether sinful or saintly.

No work on Augustine can omit his brilliant deconstruction of Cicero's hopes for a moral republic. Von Heyking's riff on this classic theme is characteristic of his project. Augustine says that "a people is a community of a rational multitude which is associated by a communal concord of the things it loves" (p. 83). To evaluate the "character of any people" requires the observational exercise of noting "what they love." "A superior people" will be "bound together by higher things" (p. 83). Generations of scholars have marveled at the flexibility of the saint's sliding scale, with its acknowledgment of the givenness and diversity of public life. However, the author's reading of the interchange with Cicero is subtly different. He says that "just as one becomes godlike by imitating Christ, one's soul is dispersed into the flux of the world when one inordinately pursues worldly goods" (p. 83). In other words, "political societies become more like the objects they love" (p. 83). To the author, Augustine is not relativizing the analysis of polities and their legitimacy but rather thinking "about elemental, existential and transcendental representation" (p. 83). Here again the author's three conversations are carried on simultaneously, distracting attention from the careful scholarship that is the great strength of this work. One is reminded of Augustine's observation in The Confessions, "Is justice therefore ... changeable? ... No, rather the times which it rules over are not identical for the very reason that they are times" (John K. Ryan, ed., 1960, p. 86).

Sustaining Affirmation: The Strengths of Weak Ontology in Political Theory. By Stephen K. White. Princeton: Princeton University Press, 2000. 158p. \$49.50 cloth, \$15.95 paper.

Morton Schoolman, State University of New York at Albany

A play on the legendary statement attributed to Stalin—"When I hear the word ontology I reach for my gun"—captures the anticipated reaction of some to Stephen White's provocative work. It would be better if these readers were slow to draw. For White demonstrates that, wittingly and unwittingly, poststructuralist, postmodernist, and other theoretical types who eschew foundationalism nevertheless commit themselves to ontologically "sustained" (prefigured) ethical and political "affirmations" (judgments, values, insights, theories). He documents their "turn" to a new form of ontological justification. "Weak ontology" produces strong political theory, an important discovery for all theorists who are also post-Stalinists.

On one level, Sustaining Affirmation is a masterful comprehension of the thought of George Kateb, Charles Taylor, Judith Butler, and William Connolly, or, if a reader's interest runs to the generic, of versions of liberalism, communitarianism, feminism, and poststructuralism/postmodernism. Each theorist White examines has been prolific, and often difficult, which speaks to the great value of a thorough critical work that explicates and clarifies without simplifying. At a deeper level, his purpose is to lay bare the ontological infrastructure of the aforementioned theoretical genera, the weak ontology that in different ways and to different extents animates the political theory of the four thinkers representing them, a task accomplished powerfully.

Weak ontology is late modern in contrast to the modernity and premodernity of foundationalist strong ontology. Strong ontology's claims to universality and certainty, its hostility to contingency and indeterminacy in thinking about political life, are opposed by its weak ontological counterpart, which likewise opposes the strong ontological basis of traditional liberal theory, notably its disengaged, unencumbered subject. Weak ontology's opposition is anchored in an insistence on the essentially contestable nature of all concepts fundamental

to political theory, emphatically those of self, other, and world intrinsic to thought, designed to adequately orient us ethically and politically to late modern life. Contestation is directed not only toward contending theoretical positions. It is a continuously self-reflexive movement that every political theory must build into itself to disrupt its own fundamentals, their coalescence, and the systematizing structure that coalescence produces. This "folding" or "enactment" of contestation, in White's ontological terms, installs a mechanism for arresting theoretical tendencies toward reification, the hallmark of strong ontologies.

Weak ontology conceptualizes subjectivity as "sticky"agency is linguistically entangled, mortal, and conscious of its finitude, capable of novelty while self-identified with an ultimate source of its being to which it is attached steadfastly as it evokes its reverence and wonder. These (contestable) universals, the anatomy of weak ontology, are fleshed out in the analysis of his four theorists and come to life differently by means of their different embodiments in each theory. Each clothes these universals in various "figurations" of meaning, bearing imprints of the historical circumstances in which theory necessarily is entangled. Through universals, weak ontology creates in political theory an aesthetic-affective sensibility to the world, enabling it to think and feel the world in definite ways. As the source of political theory's opening to the world through which its thinking and feeling absorb existence, weak ontology must be "cultivated." Cultivation requires time and care to shape the figurations of being that finally "prefigure"—orient us cognitively and affectively—to ethical and political insights and judgments. Here I found White's idea of political theory to be especially poignant. Political theory's debt to weak ontology, through which images of existence are able to pass in order to play their role as prefigurations of possible ethical and political forms of life, is repaid by a beauty reflected in its openness to the world. After considering White's readings of several theorists, it is this aesthetic quality of political theory that loomed larger than any other. Springing from weak ontology, the aesthetic becomes political theory's lifeblood.

White discovers properties of weak ontology in Kateb's theory of "democratic individuality" that enable him to theorize social and individual existence in ways adequately prefiguring the value he accords to individual rights, individuality's equal recognition of the other in the creation of its own identity, and constitutional democracy. Kateb's prefiguration of ethical and political judgment falters with a conception of justice immune to the way the identity of the other is effaced in individuality's self-creations of identity, a shortcoming, White proposes, remediated through a more robust ontological engagement with language and finitude. Underscoring the important weak ontological work that God's absence performs in Kateb's confrontation with problems created by thinkers on whose shoulders he stands, White also criticizes his dismissal of theism and appears to suspect him of artificially shoring up his prefigurations with compensatory ontological moves. Taylor offers White proof that theism need not entail a strong ontology and is compatible with a weak ontological model's prefigurations of the political. Theism, for instance, does not prohibit Taylor from immersing subjectivity in the linguistic stickiness underrepresented in Kateb's theory. It is precisely the linguistic dimension of Taylor's weak ontology that prefigures his communitarian liberalism, with its stress on the normative good of culture for its partial constitution of identity.

Whereas Taylor's theory of language enriches his weak ontology, Butler's weak ontological framework tends toward a certain "thinness," owing to a linguistically overdetermined deconstruction of identity. This ontological deficit is egregious

where White discovers a deep ethical impulse at work in her analyses of discourse and power, a sympathy for "bodies that do not matter" connected to an idea of community where the language/power nexus would be negotiated in ways more generous to the self. This ethos of generosity wants for an adequate ontological prefiguration. Thinness surfaces again where the inertia of deconstruction creates a disposition toward viewing all identity as oppressive and to be discarded. Attention to finitude, White argues, would imbue identity with greater weight, chastening Butler's allegiance to the human being as an "infinite becoming machine."

Connolly's weak ontology nearly parallels White's model of prefiguration. Particularly important is Connolly's cultivation of the aesthetic-expressive dimension and of reverence for being, which are tied intimately to his notions of being and becoming and prefigure his ethos of critical responsiveness. White is especially interested in the way this ontologically framed ethos of critical responsiveness informs Connolly's critique of pluralism, his idea of expanding pluralization through a micropolitics of the self, and in how political liberalism can be shored up by at least a partial accommodation of Connolly's ethos. Critical responsiveness still proves to be inadequately prefigured. Turning to Martin Heidegger, who throughout the book has been brought in to rescue ontological-ethical/political connections, White outlines an approach for strengthening Connolly's weak ontological prefigurations. Connolly's weak ontology is the strongest of the four thinkers. His political theory is richer because it is richer as a weak ontology.

Weak ontology raises interesting questions where it also may be problematic. The question of origins: Does White tease weak ontology out of the fabric of contemporary political theory, or does he first assemble it from elsewhere and bring it to bear critically on theory? If the former, political

theories are addressing implicitly the same ontological issues, meaning that something of deep philosophical importance is going on in recent political thought. If the latter, weak ontology may be obscuring significant nonontological differences among theories. The question of sustaining weak ontology: Although its fundaments are contestable, does defending a weak ontology reproduce the paradox that plagued strong ontologies—providing a foundation for a foundation? Or if weak ontology sustains strong political theory, is it then also sustained by the strength of a theory? Justification becomes circular. The question of outing: At times, White wants a tighter connection between weak ontological figurations and the ethics and politics they prefigure. Does this tighter connection betray an underlying desire for a strong ontology? Finally: White may error in thinking Kateb a liberal; Kateb relates individuality to a purer idea of constitutional representative democracy than liberalism permits, which affects how his thought can be redescribed ontologically. The late modern democratic world may have overcome finitude in ways that lend plausibility to Butler's concept of the self as an infinite-becoming-machine. Connolly's amoral source for sustaining his ethics and politics is not external to life and not open to Taylor's connection between external amoral sources and violence, as White contends. If the compatibility of Taylor's theism and weak ontology does not affect the latter's contestability, does weak ontology need theism at all? This question can be posed in several forms.

While it is possible to review only a few arguments of this tightly woven examination of the philosophical scaffolding of contemporary political theory, it should be clear that Sustaining Affirmation is a highly original project that is brilliantly executed and leaves recent political thought looking different than in any other of our current attempts to understand it.

#### **American Politics**

Southern Democrats in the U.S. House of Representatives. By Stanley P. Berard. Norman: University of Oklahoma Press, 2001. 250p. \$22.95.

Nicol C. Rae, Florida International University

The rise of partisanship in Congress has been one of the most conspicuous features of American politics during the 1990s. David Rohde's (1991) Parties and Leaders in the PostReform House demonstrated that much of this rise in partisanship could be attributed to the convergence in congressional voting between Northern and Southern Democrats. Since the New Deal, the latter had traditionally allied with Republicans on many issues in a bipartisan conservative coalition that generally dominated both Houses of Congress and constrained liberal legislative outcomes. While Rohde and Barbara Sinclair (Legislators, Leaders and Lawmaking, 1995) have emphasized how institutional rule changes in the 1970s created a much greater incentive for party loyalty among members of Congress, relatively little attention has been paid to the extent to which enhanced partisanship in Congress has been driven by "bottom-up" electoral imperatives. Stanley Berard's new book on Southern Democrats in the House convincingly shows that major changes in the southern electoral environment were equally important in promoting convergence in the voting records of Northern and Southern Democrats, leading to a more partisan House overall.

Utilizing a combination of survey data and roll call voting analysis, Berard shows that a variety of interrelated factors have forced Southern Democrats to respond to very different electoral constituencies in the past two decades. He also makes good use of Richard Fenno's (Homestyle, 1978) concept of the different "primary" and "reelection" constituencies that House members have to accommodate, in order to illustrate the conflicting electoral pressures on Southern Democrats. Southern black voters are now enfranchised and constitute the Democratic voter base in southern congressional elections. At the same time, most of the most conservative white Democratic voters have moved to the Republican Party as a genuine two-party system has evolved in the South. Federal court decisions have also led to the creation of a greater number of urban districts in the South, which are less ideologically conservative and tend to favor more liberal Democrats.

Underlying this southern electoral realignment, Berard's analysis reveals, is a highly complex and fluid picture of Democratic congressional electorates in the South. With the departure of conservative whites to the GOP, both "primary" electorates and the broader "reelection" constituencies became closer ideologically to northern Democratic congressional electorates during the 1980–96 period. This was particularly evident on economic issues, but during the 1990s, there was increasing convergence between northern and southern reelection constituencies on civil rights, social/cultural issues,

and foreign policy issues as well, although southern Democratic "reelection" constituencies remained somewhat to the right of the national norm on most of these matters. The author also finds, moreover, that the urbanization of the South has created a new urban Democratic constituency of (largely upper-middle-class, professional) white liberal voters who are ideologically aligned with liberal positions nationally—particularly on the so-called "social issues" like abortion, affirmative action, and gay rights. Indeed, his analysis reveals that V. O. Key's finding (Southern Politics, 1949) that southern white conservatism tends to rise directly in accordance with the size of the black population in a particular area, while still accurate with regard to the rural South, no longer holds up for the urban areas of the region where the opposite now appears to be the case.

Berard finds that regional convergence is even more apparent with regard to "primary" electorates, and following Edward G. Carmines and James A. Stimson's model of issue evolution (Issue Evolution, 1989), he expects that the broader "reelection" constituency of southern Democratic congressional voters will eventually reflect the views of party elites. The impact of core electorates and voter mobilization in this context is worthy of further study, however. Berard does not discuss the increasing role of national Democratic-supporting interest groups (gays and lesbians, teachers' unions, trial attorneys, black organizations, feminists) in providing funds and activists for Democratic congressional candidates, but the influence of national interest and activist groups and of the national media has surely been significant in the rise of increasingly convergent party congressional campaigns and electoral constituencies. The impact of "primary" electorates on members in an age of political action committee financing and declining electoral participation was demonstrated by the 1998 House vote on the impeachment of President Clinton. Most Republicans voted to impeach Clinton in defiance of national polls because they (correctly) judged that their primary electoral constituency would be more likely than not to be in complete agreement with their actions. Similarly, all but a handful of southern white Democratic congressmen voted against impeachment, although their states and districts generally appeared to have had a low opinion of the former president's conduct.

Berard argues (pp. 158-60) that the 1990 redistricting and the creation of 13 new black-majority districts in the South ultimately had little impact on the 1994 Republican landslide in the region, which was more determined by national issues. In fact, Republican gains in 1992–94 were disproportionately in the southern states, and Republican numbers of U.S. House members increased markedly in almost all southern states while those of white Democrats went down. This was not due to the defeat of Democratic incumbents but was the creation of more open seats after redistricting and the retirement of many white Democratic incumbents, who faced the difficult prospect of running against an African American Democrat in the primary in a black-majority district or, alternatively, facing a Republican in a lily-white district almost completely bereft of the Democrats' base voters. Redistricting in the South certainly was a crucial factor in increasing the number of Republican seats in the region in 1992–96 and maintaining a Republican majority (albeit narrow) in the House since 1994.

Overall, this is a very fine and worthy piece of scholarship on an interesting and relevant topic. Berard convincingly marshals his data to make his case, and the book is lively and well written. Given that the forces driving both parties toward polarization and internal convergence are not likely to depart the political scene anytime soon, we can expect the increasing homogeneity of national Democratic and Republican congressional electorates to continue over the course of the next decade.

The Trouble with Government. By Derek Bok. Cambridge, MA: Harvard University Press, 2001. 493p. \$35.00 cloth, \$19.95 paper.

John R. Hibbing, University of Nebraska-Lincoln

When first presented with this book, I confess to harboring two strong reservations—both, as it turns out, badly misplaced. First, perhaps because the author is a widely known American who was once the president of Harvard and, therefore, spent considerable time among movers and shakers, I was prepared for a broad, rambling, and discursive book peppered with anecdotes, personal musings, name-dropping, and disconnected prescriptions for change. Second, no doubt because I have never been fond of the overarching evaluation exercises that so enthrall foundations, when I read in the introduction that this volume on government had been commissioned by three major foundations, I feared I was about to read another governmental report card accompanied by the obligatory and often vacuous justification for the grade assigned in each area.

But this book is not at all superficial and self-indulgent, just as it is not at all a predictable foundation report card. Instead it is thorough, serious, and creative. The book betokens an author who has done a tremendous amount of work, who has a detailed knowledge of the relevant scholarly literature, who cares about his country, who is thoughtful, and who writes well. Though Derek Bok does come close to doing so in preliminary chapters, at no point in the book does he assign grades to any portion of government. The book is too inventive and prescriptive for that. My preconceptions were wrong and I am ashamed of myself.

The Trouble with Government begins with a description, drawn heavily from Bok's previous work, of the issues the United States government seems to have handled well and the issues it seems to have handled poorly from the 1960s to the 1990s. By Bok's reading of the data, for example, the country has made substantial strides in such areas as research and technology, race relations, the arts, the environment, and the well-being of children as well as the elderly, but personal responsibility and crime have worsened. Bok's focus then shifts to a comparison of progress in the United States with the progress made by other developed Western democracies, and his conclusion here is much less anodyne. Progress in the United States compares unfavorably in all areas except scientific research and a few isolated other measures. This disappointing appraisal sets the stage for the book's central questions: why is the U.S. government not performing better and what can be done to improve its often desultory performance.

Much to his credit, Bok's answer is clear. He believes there to be three central problems with how government operates. First, the U.S. system generally and Congress specifically are parochial, overly decentralized, unaccountable, and more eager to appear to be solving problems than to be solving problems. Second, the U.S. regulatory system is based on a rigid, legalistic, adversarial model, rather than on the flexible and cooperative design that characterizes some other countries. Finally, citizens of "modest means," particularly working people and those who would like to be working people, are not engaged in government, and therefore policies meant to assist them are inadequate or perhaps nonexistent. As a result of these problems, statutes are badly designed, regulations make citizens and businesses hopping mad, and working people and the poor fare badly and are disaffected.

What to do? Bok is distinctly unpersuaded by the ability of currently popular reforms to bring much improvement. He is appropriately dismissive of efforts to bring government closer to the people by having more initiatives and referenda, by creating opinion panels, or by devolution. He has only a little faith in typical efforts to reinvent governmental, especially bureaucratic, procedures. And he does not believe campaign finance reform addresses the core of the problem. Rather, Bok seeks to give more direction and unity to government by strengthening parties, by weakening such alternative power bases as congressional committee chairs and legislative rules that protect the rights of minority opinion, and by weakening the separation of powers. He even flirts with the idea of "requiring voters to choose between each party's slate of candidates for federal office instead of allowing them to vote for a president from one party and a senator or member of Congress from the other" (p. 287). With regard to regulations, Bok wants to rely more on the marketplace, he wants to use more comparative risk assessment and cost-benefit analysis, and he wants regulators to listen more carefully to those being regulated so that a spirit of cooperation can be established and silly, unreasonable regulations will no longer be promulgated. And he thinks that citizens of modest means can be engaged by further reform of electoral law (perhaps even compulsory voting), by strengthening unions and otherwise promoting workplace democracy, and particularly by increasing people's involvement in organizations and clubs. such as community development corporations.

This is an intriguing blend of remedies in that it seeks to unify the institutions that Montesquieu and Madison separated, to restore the vivacious associational life that de Tocqueville noted 150 years ago, and to establish a more corporate and European relationship between business and government. Bok longs to combine parliamentary-style institutional change, group-based social capital, and regulatory reform: a marriage of James McGregor Burns and Robert Putnam with Ronald Reagan presiding. There is something for most everybody here. Liberals will be attracted to Bok's desire to empower the underclass; conservatives will applaud his wish to allow the regulated more influence in the drafting of regulations; and good-government reformers will support his desire to make government simpler, more accountable, and more popular.

I have my own view of these proposals, but that view is not as relevant to this review as the probability that these proposals will not achieve the outcome Bok seeks and that they are, in that sense, badly misguided. If the goal is to renew people's faith in their government, why start by increasing the clout of the very entities they dislike the most? People despise interest groups and political parties, yet Bok calls for institutional reforms that will enhance the electoral-governing role of parties and the regulatory role of special interests. The people do not want Enron and Haliburton writing energy regulations any more than they want the Sierra Club doing so. They do not want the AFL-CIO or the National Association of Manufacturers to be given more influence. The people do not want either the Democrats or the Republicans to be given a clear path to enact change, and they do not want party leaders in Congress to be given more power than they already have.

More controversially, I would maintain that the "citizens of modest means" that Bok so badly wants to involve in government would rather not be involved in government. They find it distasteful and not particularly relevant, and they have other things they would much rather do with their time. Motor-voter did not help, and making voting day a holiday would not help much either. And does anyone seriously believe that making voting mandatory would lead people to feel better about their government? Joining groups and

otherwise working together undoubtedly have many good consequences, but no evidence exists that they make people more appreciative of government or more involved in it (any correlation between joining groups and political involvement is almost certainly spurious). Indeed, recent experimental work has indicated that when people provide input to a decision maker believed to be somewhat self-interested, they actually feel less influential and more frustrated than when they have no input at all. So the notion (which Bok shares with many well-intentioned reformers) that if only we could get the uninvolved to participate they would be pleased with government, would participate more in the future, and would help the government to make better decisions is both terribly inviting and terribly wrong.

But agreement with the author's prescription for improving the United States government is not necessary to make *The Trouble with Government* a worthwhile read. I found his evaluation of government to be much more persuasive than I thought I would, and it is difficult to argue with many features of his description of the problems. Writing actual recommendations for change is by far the most difficult part of any book on government, and so I think stimulation, not agreement, should be the standard for judging prescriptions—and I certainly found Bok's prescriptions stimulating. I recommend this wide-ranging, learned, insightful book to all who care about U.S. government.

Rational Lives: Norms and Values in Politics and Society. By Dennis Chong. Chicago: University of Chicago Press, 2000. 292p. \$45.00 cloth, \$18.00 paper.

Howard Margolis, University of Chicago

Dennis Chong proposes an account of how to forge a merger between rational choice and sociological explanations of the role of norms, values, and symbols in politics. The core idea is that norms and values (not just self-interest) are indeed essential for understanding political choice (as a sociologist would expect), but that norms and values have to develop. Those in place today change over time. And rational choice enters in guiding that evolution.

So on this account, we could expect that norms and values in place within a community lean toward serving the interest of that community, but with a lag. Conditions change, and norms change in response to that, but not immediately. We get a sort of Bayesian view of the evolution of norms and values, where what used to make rational sense in a community is the analogue of a Bayesian prior, which holds back full adoption of what may now make sense. Both the sociological (expressive politics) and economic (rational choice politics) views are essential.

Chong's labels are "dispositions" and "incentives." Once dispositions are in place they do not easily change. But over time they do change, in response to rational incentives. Defining what interests are, however, turns out to be troublesome, since interests are not necessarily narrowly material interests. Anyone who watches how actual human beings behave (in contrast to only calculating how game theoretic rational actors ought to behave) is very likely to agree. But this leads to analytical ambiguities. Chong's proposal here supposes that empirical experience gradually teaches a person how changes in values and norms would improve the situation. But this seems easier to agree to with respect to norms than to values. And even for norms there is Mancur Olson's collective action problem: Norms may make us all better off, but often an individual would be better off if everyone else complied but he or she avoided the obligation. So how do norms evolve under Chong's model of individual choice?

Chong develops the argument over a series of chapters specifying how he takes these interactions to work, but leaving rather open his answers to the questions just noted. Nevertheless, he has interesting things to say about the elements of his argument (the links between individual choice and the dynamics of groups, defense mechanisms that slow the response to new conditions, and why to some extent they are functional.) This includes development of a formal model in Chapter 2, although use of the model turns out to be not very central to the enterprise. There are insightful case studies in the later chapters, especially of the evolution of racial norms in the South under pressure from the federal government. There is a detailed case study of the response of a Texas community on the far outskirts of Austin to the tension between the promise of economic development and the concerns of a very conservative community about the kind of people tolerated in Austin who are becoming a major force in Williamson County. Another case concerns the response of the New England fishing community of Gloucester (of "perfect storm" fame) to the appearance of the Unification Church (Moonies).

All this is put effectively to work to show the strength of Chong's view (as against a single-mindedly sociological or single-minded rational choice view). He is alert to the feedback of changing norms, not only on the costs and benefits of norms that have not (yet) changed but on how the effects are themselves valued. If you think you ought to do something, that does not guarantee that you will like to do what you now think you ought to do, but it certainly increases the prospect of tastes moving in that direction.

There is not much reference to the formal modeling in the case studies—none at all, really, in the Williamson County case, which is the most detailed—but Chong returns to the modeling near the end. I did not see much that was substantial in the modeling, but there is a good deal of room for varying styles in such things. What one person finds exciting another can see as just mathematical hand waving. Formal modelers will want to think about Chong's modeling. But those with no taste at all for such stuff can safely skim past it. Nearly everyone, I think, will get something out of the sharply observed case studies. And the basic perspective—that we will profit from careful, increasingly precise thought about how rational choice incentives and social influences interact and mutually influence each other—is surely correct.

**Championing Child Care.** By Sally S. Cohen. New York: Columbia University Press, 2001. 397p. \$52.50 cloth, \$26.00 paper.

Joyce Gelb, City University of New York

Sally Cohen has written an important and comprehensive analysis of child-care policy in the United States, challenging the conventional wisdom that no such federal policy exists and that child care is not a major government priority, in contrast to other democratic welfare states (e.g., the Scandinavian countries and France).

The book is premised on the hypothesis that changes in political institutions and organized interests shape the outcomes of policy. To this one might add another aspect of policy change that Cohen well documents: demographic changes, including the large numbers of working mothers with young children (62% of women with children under three years of age in 1996). The numbers of children in day care quadrupled from the late 1970s to 1990 (75% of American children utilized some type of child-care arrangement by 1995), and early childhood programs for the 13.3 million children living in poverty have proliferated as well (pp. 3, 7, 11). However,

as Cohen points out, if the number of working women alone determined policy outcomes, different solutions would have been arrived at years ago. The analytic framework the book employs utilizes the concepts of major public policy analysts: Baumgartner and Jones's punctuated equilibrium, Sabatier and Smith's advocacy coalitions, and the "new institutionalism" and "historical institutionalism." Cohen looks to the latter's emphasis on path dependency, stressing the difficulty of reversing long-standing patterns that negated the importance of addressing national child-care policy.

In her 30-year review of child-care policies, Cohen begins with the Nixon veto in 1971 of comprehensive child-care legislation. She then guides us through less familiar eras of policy making on child care, including developments in the late 1980s that led to the passage of landmark legislation in 1990, and finally the 1996 welfare reform act and its impact on child-care policy. Her approach is to try to explain why these three critical junctures for policy occurred when they did and also to illuminate processes that sometimes led to unlikely (e.g., Republican conservative) sponsorship in a policy area normally promoted by Democrats. The book deftly connects child care with welfare reform and support for children in poverty, and it emphasizes the federal aspects of child-care policy, particularly through Title XX and more recent policies, which have provided state funding for child care.

Cohen demonstrates the intricacies of policymaking on child care, documenting conflict over vouchers and clashes between advocacy groups and members of Congress from both parties. Another source of conflict has been the issue of funding child-care providers with religious affiliations. Concern over federal standards and state prerogatives also impeded legislation for a long period. It is clear from the analysis presented that the complexities of the federal system profoundly affect child-care policy, which relies on state implementation. The book is strengthened by the painstaking attention Cohen gives to the complicated implementation process after the passage of each piece of legislation; for example, she examines conflicts regarding standards, licensing, and early education (such as the Head Start program) within the context of devolution of policymaking to the states.

The book provides detailed information on the littleknown policy negotiations of 1990, which led to what Cohen views as pathbreaking "breakthrough" legislation on child care in the first Bush administration as part of the Omnibus Budget Reconciliation Act (p. 130). The law provided particular assistance to low-income families, although the Child Care and Development Block Grant was the first federal childcare program not connected with welfare. The At Risk Child Care program marked an important and unusual congruence between the executive and congressional branches of government. Cohen emphasizes the key role of committees in the process, stressing the importance of rules changes that enhanced the participation of greater numbers of members of Congress, the support of the president, and the advocacy of the Children's Defense Fund in explaining the policy change. She attempts to shed light on the factors that led to positive change under Republican presidents and right-wing control

The 1996 welfare reform bill (the Personal Responsibility and Work Opportunity Act), with specific focus on its impact on child-care policy, is the third policy issue analyzed in depth. Among other aspects of the legislation was withdrawal of a federal guarantee for child care, as well as decreased funding for other child-care programs, though there was reauthorization of funding for many of the 1990 reforms. And, although they are less dramatic, Cohen points to initiatives during the latter part of the Clinton administration, including increased attention and support for policy dealing with after-school care

for children, as well as further research as child-care-related issues were redefined to broaden support.

It is difficult to fully assess the child-care initiatives documented here and the progress that Cohen asserts has occurred, that "the child care development block grant has institutionalized child care within the federal government" (p. 303). A chart of the federal structure of responsibilities on this issue would clarify the nature of institutionalization. Is there a coordinated federal effort around issues of child care at present; can the view that federal policy matters be documented? Data would also help our understanding of what has been accomplished by the enactment of these policies: those who have benefited from the initiatives in child-care policy and those who have not. A comparative lens would aid in clarifying policy gains as well. For example, how do child-care initiatives compare to others in such related policy arenas as health care and the Violence Against Women Act? A particularly significant omission in the book is the absence of analysis of tax credits and deductions as major instruments of child care policy in the United States.

The strength of this book may lie in documenting processes and policy outcomes, in itself a major achievement, rather than in providing full explanations for them. What factors are most responsible for the policy changes examined? More attention to the limited role of women's groups in the policies analyzed would be welcome. In the final analysis, as Cohen suggests, the study fails to fully confirm the perspectives of those policy analysts whose frameworks she employs (p. 278). Perhaps it is necessary to look beyond these to others, exploring the notions of "incubated innovations" and "redistributive" policymaking more fully (p. 278).

Cohen has done an admirable job of aggregating a record of accomplishment in a policy arena unfamiliar to many students of social policy. However, a truly comprehensive national child-care policy for the United States is still not a reality. As she suggests, the next stage may necessarily involve a focus on child care beyond welfare.

Fenced Off: The Suburbanization of American Politics. By Juliet F. Gainsborough. Washington, DC: Georgetown University Press, 2001. 191p. \$70.00 cloth, \$24.95 paper.

Gerry Riposa, California State University, Long Beach

By the 1970s—and, some might argue, a decade earlier—America had shed its urban persona and had metamorphosed into a suburban nation. Yet in comparison with research done on cities and urban politics, little work had focused on this transition and ensuing suburban politics. Juliet Gainsborough's work seeks to reduce this deficiency by examining the suburban movement, its motivations, and their linkage to political behavior. Thankfully moving beyond previous discussions of mortgages and work commutes, the author narrows the focus of this short monograph to how living in the suburbs affects voter choice and policy preferences by altering the decision-making calculus (p. 8).

The author's thesis is that public opinion and behavior are related to resident location. Her hypothesis is that suburban dewellers—defined here as those who live in a metro area but reside outside the boundaries of the central city—think differently about national politics and, as a consequence, vote differently (p. 4). Hence, the guiding question throughout the book: Do suburban dewellers have unique political views that are conditioned by where they live, or are their views related to individual-level characteristics that would operate the same way regardless of residence?

Her data are drawn from the Congressional Research Service, 1990 Census, and the American National Election Studies 1952–1992. Using homeownership as her independent variable, the author examined relationships with party identification, support for congressional and presidential candidates, and policy preferences on government spending and welfare spending.

Providing a useful literature review on the definition, development, and myths of suburbs, Gainsborough offers the following argument. The move to suburbia is not the result of some gravitational pull toward conformity, but rather a retreat to defend local boundaries. In the author's words, "the fencing off of a community is not only a rejection of what lies outside but also a fear of losing what lies inside" (p. 17). Thus, living in suburbia shapes political behavior and generates a conservative tendency that can be demonstrated through candidate and policy preferences. As the country becomes more suburban, the likelihood that they will be represented by conservative politicians increases, and with it more conservative decisions on federal spending and less support for central cities. Simply put, she argues that place matters.

The author's findings generally support her hypothesis and argument. While suburbs are diverse, their political behavior demonstrates certain generalizable trends (p. 71). Suburban residence does relate to increased support for Republican Party candidates and opposition to government spending for service provisions for cities and welfare (pp. 68, 75). This opposition is less pronounced for social security, leading the author to conclude that if benefits are perceived as primarily middle class, government service is more acceptable. Both findings suggest a distinctive suburban political character that is not accounted for by differences in socioeconomic characteristics (p. 77). Still, the strength of the relationship, though frequent, remains small (p. 80).

But are suburban voters distinctive, tending to be more conservative because of where they live, or are conservativebased populations self-selecting, tending to move to a place they perceive as appealing to conservative values? This study is unable to separate or tease out which has the greater independent effect. According to the author, it is probably a combination of both. As she puts it, "Particular kinds of people leave the city for the suburbs and once there their behavior is reinforced" (p. 77). Home ownership alone does not carry the predicted impact, but owning a residence along with others who seek to insulate themselves may generate the distinctive suburban character. Regardless, the relationship between suburban living and political behavior is evident when the author controls for socioeconomic variables and when party identification is taken into account. Her reasoning is that if preexisting political attitudes are causally related to suburban migration, then one would expect that including party identification would negate the suburban effect and it does not (p. 77).

For Gainsborough, the greater point is that suburban place matters in American politics, and with unabated numbers continuing to move to the suburbs, the impact of this spatial relationship to political behavior will only become more influential. This migration—what Gainsborough calls a geographic sorting of voters along racial and economic linessuggests that the clustering of middle-class and higher incomes in these resident communities explains the move to the political right and the ascendancy of conservative candidates and policies (p. 111). In the offing, central cities and low-income and working-class communities will be disadvantaged in the competition for federal support, particularly if Democrats move to the right in an effort to capture some portion of this rising suburban constituency. This cleavage between urban and suburban is not absolute. As suburbs become older and experience the same problems as cities, they tend to lose their distinctiveness from cities. Nevertheless,

the author concludes that this form of localism will make its presence felt for some time, unless community and common bonds are defined across city/suburbs lines (p. 139). She suggests that intergovernmental agencies should take the lead in promulgating policies to make this connection. As to what policies and strategies are best suited for creating a nexus between city and suburbs, she leaves to future research.

For those interested in how spatial arrangements shape America politics, this monograph is worth the read. In a compact, accessible analysis, the author strips away some of the myths and ambiguity surrounding suburban living and its role on political behavior. For those supporting decentralization and conservative primacy in national politics, these findings will bring a measure of comfort. For those interested in a more progressive presence in national politics, this book is your wake-up call.

Governance and Performance: New Perspectives. Edited by Carolyn J. Heinrich and Laurence E. Lynn, Jr. Washington, DC: Georgetown University Press, 2000. 349p. \$65.00 cloth, \$23.95 paper.

Improving Governance: A New Logic for Empirical Research. Laurence E. Lynn, Jr., Carolyn J. Heinrich, and Carolyn J. Hill. Washington, DC: Georgetown University Press, 2001. 212p. \$60.00.

Dianne N. Long, California Polytechnic State University, San Luis Obispo

Carolyn Heinrich, Laurence Lynn, and Carolyn Hill are public management and policy scholars who puzzle over the workings of government. Their efforts aim not only to add to our understanding of these workings but also to provide a template for future study. The first volume by Heinrich and Lynn is designed around a set of working papers originally introduced at a conference of government and policy scholars in May 1999 at the University of Arizona, and are oft referred to as "the Arizona papers." The publication is the result of a research project funded by the Pew Charitable Trusts to study best practices in government management. The second volume authored by Lynn, Heinrich, and Hill argues for a theoretical framework to guide future research.

The Heinrich and Lynn book could easily be called "workings." It focuses on issues of organizational design in answering the questions: "What does government do?" and "What difference does it make?" The exploration of research lays out the most recent advances in theories and statistical methods. In organizational parlance, this set of observations considers government organizations as whole systems, rather than as patterns of policy behavior. The authors consider the study of governance as "regimes of laws, administrative rules, judicial rulings, and practices that constrain, prescribe, and enable government activity" (p. 3). The authors consider legislative mandates, administrative structures, and formal organizational features, such as networks. Much of the discussion concerns what can be called "the logic of governance." This logic incorporates legislative actions and its bureaucratic responses. As a collective work, this book presents valuable insights into bureaucratic behavior and government programs, including Chicago's schools, jobs programs, welfareto-work, legislative regulation committees, and health

The cases presented center on providing a theoretical and empirically based literature on government institutions. The sense of the volume is in harmony with central questions of the classical school of organizational behavior: What is the ideal organization? What is the one best way to deliver a product or service? What factors enhance outcomes? These

questions have never been absent from our inquiry related to administrative theory and organizational behavior.

The set of cases focuses on contemporary governments carrying out policy initiatives. Various features of today's organizations are clearly considered by this set of well-known scholars. Melissa Roderick, Brian Jacob, and Anthony Byrk provide an analysis of student achievement data. The study finds that extra instructional time and investment in student progress are important factors to success. Heinrich and Lynn (the editors) provide a descriptive analysis of the Job Training Partnership Act. They find strong association between policies and incentives and with administrative forms that shelter programs.

A number of cases deal with welfare-to-work programs. Edward T. Jennings, Jr., and Jo Ann G. Ewalt look at both top-down and interpersonal system approaches in state welfare delivery by using interviews of state administrative personnel. Lowered caseloads remain a hope in future welfare reform. Jodi Sandfort examines the effect of welfare-to-work organizations and outcomes in 82 Michigan counties. Interviews with managers and discussion of administrative data reflect a range of interventions and related outcomes. James Riccio, Howard Bloom, and Hill consider administrative records of welfare-to-work programs and survey data in sample counties in eight states. Their interest is primarily in factors that increase earnings and recipient motivation for staying on the job.

Within another policy perspective, Jack H. Knott and Thomas H. Hammond consider deregulation legislative outcomes in banking, trucking, airlines, and telecommunications. They look at how legislation shapes regulatory committees and competition among policy actors. In another case study, Laurence J. O'Toole, Jr., and Kenneth J. Meier provide a narrative of a formal model of hierarchy, networks, and management arrangements. They suggest that management roles become less important as hierarchies become more defined. Patricia W. Ingraham and Amy Kneedler Donahue also consider management arrangements in their review of management uses of financial, human resources, capital, and information technology "subsystems." The case emphasizes the importance of integration for management results. Lastly, John W. Ellwood provides a skeptical argument on modeling governance. He voices ideas raised by Herbert Simon and lays out such questions as "Who should determine policy choices when goals are unclear?"

The writings clearly explain delivery of public policy from a holistic organizational approach. The unique, sometimesquirky behavior of individuals and their motivation is less important in these case studies. The writings as a whole are provocative and insightful. While they may not become predictive models of governance and performance, they provide a solid survey of what government researchers are talking about. They raise questions, propose study approaches, make tentative findings, and point the way for future researchers. The volume is a good overview of organizational design issues for those who have an interest in bureaucracy and policy, as well as for those who would embark on any study of government.

Reading the first volume facilitates an understanding of the thinking behind the second volume, *Improving Governance: A New Logic for Empirical Research*. Here Lynn and Heinrich team up with Hill to provide a literature review of the theories, models, and methods of the social sciences applicable to public management research. The authors take on public assistance child protection, job training, drug abuse treatment, and public education while considering the challenges such programs present for the researcher. A synopsis of the first governance volume takes hold here. The

conversation continues to lead into considerations of the researcher. For example, they puzzle over data issues: "A central empirical problem in governance research is obtaining data that will enable investigators to explore causal relationships beyond a narrow perimeter of theoretical possibilities that leave too much out of the picture" (p. 18). Their research model has strong parallels with the market model used in economics to inform behavioral research. The core of the model considers the elements of legislative choice and political assessment together with governance. Here we see the influence of political economy, bureaucratic control, and socialized-choice paradigms. The struggles of the researcher are central to the discussion of issues. Research design is a critical piece in the book. Here the authors consider design in detail and lay out models, methods, and data sets. They provide a solid review of the literature using both quantitative and qualitative approaches. In the end. they confront the constrained environment inherent in such research.

The volume is a useful review of the literature, much like the "In Search of Excellence" review of organizational behavior works. Further, it provides insights that come from practical experiences and research disappointments. *Improv*ing Governance is a valuable book for those who undertake organizational and policy research and for those desiring to do so.

In the end, the authors provide a useful moral to the tales woven in the text. "Whatever the difficulties arising from divergences between the worlds of research and practice, and however effective the policy analyst or research broker is in overcoming them, the fact remains that the influence of governance research on practice depends on practitioners who appreciate its potential value. Practitioners have an influence on governance only to the extent that they comprehend the institutional contexts in which they operate and the opportunities for influence these contexts afford" (p. 176). Amen.

A Two-Way Street: The Institutional Dynamics of the Modern Administrative State. By George A. Krause. Pittsburgh: University of Pittsburgh Press, 1999. 256p. \$45.00.

Larry B. Hill, University of Oklahoma

George A. Krause has undertaken a statistical analysis of the relationship between the president and the Congress and the enforcement activities of two regulatory agencies: the Securities and Exchange Commission and the Antitrust Division of the Department of Justice for the years 1949–92. He finds that the president and the Congress often influenced each other, but neither of the political branches succeeded in dominating the bureaucracies. These findings are consistent with the interpretations of presidential-congressional-bureaucratic power of most journalists, sociologists, historians, political scientists, and public administration scholars.

The findings are rank heresy, however, to one small group: the principal-agent theorists who set up shop within political science in the 1980s. They asserted that it was appropriate to apply the assumptions of organizational economics to the relationships between a political institution (the "principal") and a bureaucracy (the "agent"). The main assumption was that the political principal could—or should—control the bureaucratic agent through "hierarchical" authority. Unfortunately, the theorists could not agree on the identity of the political principal; some said that the president was, or should be, in charge of the bureaucracy; some said Congress. When they belatedly discovered that the American system split power over the bureaucracy between the elected branches

and that talk of the political principal was simplistic, some of the theorists developed a fallback position under which Congress and the president became "multiple principals."

The problem is that the concept of the president and the Congress as joint principals is an impermissible violation of the theory's strictures, as this scenario illustrates: At the same time, two competing insurance companies (multiple principals) direct a salesperson (agent) to sell a client a single policy. No organizational economist would argue that the conditions necessary for a principal-agent relationship existed. But the principal-agent theorists in political science skillfully used their complex jargon and methodologies to deflect attention from the shortcomings of their assumptions and analyses. In recent years, however, several researchers—cited by Krause—have pinpointed those shortcomings.

This book addresses the controversies spawned by the principal-agent approach. Krause's research framework is distinctive in that he depicts the relationships among the main actors as being dynamic (they change over time) and interdependent (they constitute a system). Furthermore, bureaucracies may either be acted upon or initiate action—the "two-way street" notion of the title. When he used complex formulas to compare the outputs of the two agencies (administrative proceedings, investigations, and injunctive actions for the SEC; antitrust cases and investigations for the Antitrust Division) with the "budgetary-preference signals" coming from the president and the Congress (Office of Management and Budget requests and congressional appropriations), he found that the interrelations between the elected officials were complex: "In some instances the anticipated component of budgetary-preference signals shows that presidents may influence Congress, the latter may exert influence over the former, or they may jointly influence each other" (p. 106). Krause also found that bureaucracies reacted to the politicians' attempts to control them with a variety of "sophisticated behaviors" that helped those bureaucracies to "shape their political environment. This is borne out by the empirical fact that the SEC and Antitrust Division each play a notable role in affecting the budgetary-preference signals received by each agency from its political principals" (p. 115).

Krause's study directly confronts the principal-agent approach, and his findings sharply contradict its assertions: "Both bureaucratic agencies investigated in this study display support for the notion that these institutions do not merely respond to democratic institutions in a Pavlovian fashion but instead actively shape their respective policy environments through their enforcement activities. In no single case is there empirical support for the conventional notion of political control over the bureaucracy that is found in principal-agent models espousing this perspective" (pp. 113–14). Those true believers who have not yet accepted that principal-agent theorizing has reached an intellectual cul de sac will find no comfort here. But, for three reasons, the importance of Krause's findings does not shine through as clearly as it might in this book.

First, Krause is often too deferential to principal-agent theorizing. For example, he repeatedly goes out of his way to find points of agreement with its prominent proponents, who are cited more often than appears appropriate. And, despite his anti-principal-agent theoretical framework, much of the analysis is conducted using principal-agent jargon. A book that uses with approval such terms as "multiple principals," or simply "political principals," many dozens of times bows to the influence of principal-agent theorizing, even if its research design and findings flatly contradict the theory.

Second, although this is a short book—only 127 pages, exclusive of notes and appendices—it seems longer because the introductory chapters, the introduction and conclusion to the

substantive chapter, and the appendices contain much repetitive material, as does the concluding chapter. But readers must be wary of skimming passages that are mostly redundant because new material that may help clarify the difficult abstractions is sometimes interjected. The redundancies reduce the power of the book's message.

Third, the book is overlarded with jargon (not just principal-agent jargon) and with abstractions. For example, the author is enamored with "endogenous" and "exogenous," which have a technical (and counterintuitive) meaning in terms of the statistical model, and the overuse of which may leave the reader confused. Furthermore, the style of presentation is altogether too abstract. For example, "policy innovations," or "shocks," or "perturbations" play an important role in the analysis. But determining exactly what is meant by the terms requires concentrated effort, and virtually all of the explanations are provided in abstract form—most clearly in the course of elaborating upon a complex equation on page 32. In the substantive chapter, we learn that the bureaucracies' reactions to "shocks" show "sophisticated" and "strategic" behavior, which means that they exercise considerable degrees of autonomy from the president and Congress. But the lengthy discussion provides no illustration of this "sophisticated" behavior that would move us out of the realm of abstraction.

Krause has made a significant contribution to our understanding of presidential-congressional-bureaucratic relationships. His major contribution is that he pounds another nail—perhaps the final one—in the coffin of principal-agent theorizing and brings us back to traditional political analysis, which understands that these relationships are highly complex and variable from one bureaucracy to another and from one policy area to another. Furthermore, he demonstrates that however important one of the political branches might be at a given time, American bureaucracies retain sufficient power resources so as to exercise significant degrees of political autonomy—but that political outcomes always are contingent.

Judicial Review in State Supreme Courts: A Comparative Study. By Laura Langer. Albany: State University of New York Press, 2002. 192p. \$62.50 cloth, \$20.95 paper.

Donald R. Songer, University of South Carolina

Interest in strategic approaches to an understanding of judicial decision making, including the implications of the separation of powers (SOP), has grown dramatically in recent years. Unfortunately, almost all the research on these SOP interactions has been limited to those involving the U.S. Supreme Court. Laura Langer's book provides a refreshing alternative to the exclusive Supreme Court focus by examining the significance of separation of powers concerns for the exercise of judicial review by state supreme courts.

Langer starts by making a convincing case for the importance of studying judicial review in state supreme courts. She demonstrates that these courts are important policymakers, tackling a number of important issue areas for which no review by the U.S. Supreme Court is possible.

The basic thesis of this book is that judicial review in state supreme courts is shaped by the pursuit of political ambitions, the institutional rules and arrangements governing courts in the states, the nature of the policy adjudicated by the court, and the political context in which the courts operate. Strategic models of judicial behavior are developed to explain both agenda decisions of the courts and the decision on the merits stage. Under a strictly attitudinal model, judges would vote their personal ideological preferences without regard to the

contextual and institutional features of state politics. In contrast, Langer argues that judges will be reluctant to overturn state laws in salient policy areas when other state elites hold divergent views unless there are institutional features that tend to shield the judges from the sanctions of other elites.

To test these strategic models, Langer examines all constitutional challenges to state action in four issue areas decided by state supreme courts for the period 1970–93. She hypothesizes that the extent to which judges behave strategically will be directly related to the saliency of the issue under consideration

In the most ideologically salient area, campaign and election laws, the results largely fit the predictions of the strategic models. Most notably, courts are less likely to docket constitutional challenges to legislative decisions when the ideological distance between the court and other elected elites is large. However, the presence of institutional features that might protect courts, including a difficult constitutional amendment process and a judicial retention process in which judges do not need the direct support of either the governor or the legislature, increases the chances that a constitutional challenge will be docketed. In the decisions on the merits, the evidence is mixed. As predicted by the attitudinal model, the personal preferences of the judges are strongly related to their votes, while the ideological distance between the court and other elites does not have the effect predicted by strategic models. However, several institutional features that might protect judges from retaliation by other elites do increase the chance that a challenged law will be overturned.

For the least salient policy area, welfare laws, agendasetting decisions are much more consistent with an attitudinal explanation. Most notably, as the ideological distance between the court and other elites increases, the probability that the court will hear a constitutional challenge increases. However, at the merits stage the results are inconclusive.

Overall, this book makes a significant contribution to our understanding of the role of courts in the American political system. The focus of most of the previous literature on the U.S. Supreme Court has made it impossible to adequately understand the role of institutional features and, consequently, has made it impossible to adequately test strategic models of judicial decision making. In general, the design of this study is more sophisticated than the design of most "tests" of either the attitudinal or strategic models of U.S. Supreme Court decision making, and as a result, its findings may suggest new insights for understanding Supreme Court behavior in a broader perspective. For example, the findings that state supreme courts under certain conditions will engage in strategic, rather than strictly attitudinal, voting raises questions about the widely assumed (e.g., see Segal and Spaeth, The Supreme Court and the Attitudinal Model, 1993) but untested theory that the factors necessary for attitudinal voting on the U.S. Supreme Court include docket control and its status as a court whose decisions are not subject to further judicial review. In contrast, the widespread finding of extensive attitudinal voting on the U.S. Supreme Court would be predicted from the findings of Langer's study that a number of institutional features possessed by the Court all decrease the probability of strategic voting. Among those features are the presence of an intermediate appellate court, long judicial terms, the difficulty of the executive or legislative branches to affect the retention of the judges, and the difficulty of constitutional amendment. This study further enhances our understanding of the effects of separation of powers by demonstrating that the effects that vary substantially across issue areas depend on the saliency of the issue. It is unfortunate that the importance of issue saliency is absent from most studies of separation of powers effects on the U.S. Supreme Court.

The careful design, extensive data collection, and rigorous analysis make Langer's study an important contribution to the understanding of strategic decision making by appellate courts. Nevertheless, some of the choices on analytical design and operationalization of variables tend to reduce the impact of what remains a fine study in spite of these limitations. Most disappointing, the manner in which the "legal" variables are operationalized makes it difficult to draw any significant conclusions on the relative impact of the legal model versus the impacts of strategic versus pure attitudinal models. The key legal variables are whether or not the court's opinion relies on independent state grounds and on the level of scrutiny employed (see p. 52). Unfortunately, neither of these variables is independent of the decision, and thus it is inappropriate to use them to "explain" those decisions.

Less troublesome, the methods sections need to more clearly define some of the variables. In particular, many readers will not be familiar with the measure of judge ideology adopted (see p. 44) and may need further assurances that the ideology of judges and the ideology of other state elites are really measured according to a common metric that makes it reasonable to compute distance scores between the two measures.

Finally, while the direct effects of the independent variables in the models are interesting and theoretically important, it would have been useful to explore the interactions between judge ideology and/or ideological distance and some of the institutional variables.

The Dynamics of Rules: Change in Written Organizational Codes. By James G. March, Martin Schulz, and Xueguang Zhou. Stanford: Stanford University Press, 2000. 228p. \$55.00 cloth, \$24.95 paper.

Elinor Ostrom, Indiana University

James March, Martin Schulz, and Xueguang Zhou address the fascinating question of how rules evolve in a complex organization with a unique data set. Stanford University was founded in the decades before the turn of the last century. The authors searched and coded a vast Stanford archive of materials on rules related to student contact, the student honor system, faculty appointment and tenure procedures, faculty governance, and finally rules related to accounting, purchasing, and other administrative functions of a university. They are able to examine questions concerning the external and internal stimulants to rule creation, change, and suspension. No other book equals this one in regard to the breadth of the questions asked and the mode of analysis.

The basic approach of March and his colleagues is to examine how rules evolve over time in response to internal or external problems. They see rules as recording history and accumulating the learning that individuals in an organization acquire, including the ways to cope with repetitive problems. Because they see rules as a written residue of past efforts to regularize responses to internal and external problems. they argue that one has to do historical analysis in order to understand the problems that generated the creation or modification of the rules at an earlier period. Thus, they explore a wide diversity of external or internal factors occurring over time that are posited to affect rule origin or change. Some rules may be very useful in solving a particular problem in a specific era but become an unused residue at a later time. In other words, all organizations may have rules-in-form that are rarely used, due to the fact that the problem-set they help to solve has changed over time and no one has had their attention called to the fact that a rule is no longer necessary.

Further, the authors address important questions related to organizational structure and change. They develop competing hypotheses that are analyzed with the fantastic data set they have developed. One set of competing hypotheses relates to the effects of changes in one rule on changes in other rules. Given assumptions about bounded rationality, a core question has to do with how members of a complex organization pay attention to the possibility of changing rules. The four hypotheses they develop are 1) The Contagion Hypothesis: "Changes in one rule generate attention to other rules, thus increase changes elsewhere"; 2) The Competition Hypothesis: "Changes in one rule distract attention from other rules, thus decrease changes elsewhere"; 3) The Multiplier Hypothesis: "Changes in one rule necessitate changes in others, thus increase changes elsewhere"; and 4) The Substitution Hypothesis: "Changes in one rule substitute for changes in others, thus decrease changes elsewhere" (p. 70).

In addition to these four hypotheses, they address a host of others that focus on when rules are adopted, how fast they are modified, and when they are dropped. They ask whether internal sources of problems related to conflict of interest or to technical coordination are most responsible for rule changes. They also examine environmental factors, including the proportion of the university's budget stemming from federal government sources. They use sophisticated multivariant statistics to examine their long series of event histories.

Among the surprising findings of this study is that increases in federal government funding are associated with *negative* rates of rule revision rather than positive rates, as most organization theorists would expect (p. 187). They also find that rule change is faster in meeting diverse pressure from the technical environment (involving accounting and purchasing) than it is in meeting the political pressures that exist on all university campuses (p. 190). Their findings also challenge some of the conventional views that changes in rules are stimulated primarily by the effort to manage complexity. They find "very few size and program effects in any of our models of rule birth and rule change" (p. 170).

Scholars interested in the study of institutional arrangements will find this a valuable part of their library. The methodology is one that needs to be applied to a diversity of organizations. Following an organization from its very founding is an excellent way of studying the growth of rules as a function, both of the internal coordination problems of a growing organization and the external problems that any university has faced, especially during the twentieth century. The concept of rules as "carriers of knowledge" turns out to be a powerful way of approaching the study of rules.

Institutional theorists with both a rational choice and a sociological approach to organizations will find valuable aspects in this book. Chapter 1 presents a healthy skepticism about the optimality of rules and the presumption made by some that changes in rules usually result in improvements in outcomes rather than the reverse.

Not surprisingly, March and colleagues adopt a strong assumption that individuals use a logic of appropriateness. They assume that individuals "act to fulfill identities, defining what is implied by a particular identity or what is expected, socially or morally, in a particular situation" (p. 6). The identities of individuals, however, are somewhat too strongly presumed to stem from rules. After the recent Enron scandal, one has a hard time accepting the following: "Rules define organizational identities and boundaries and stabilize linkages with other organizations. Accountants do what proper accountants do. Managers do what proper managers do. Each follows rules that define appropriate behavior for the role he or she plays" (p. 9). If only that were to have characterized the behavior of the accountants and managers of Enron and other

complex organizations, major financial disasters would have been avoided.

With a focus on rule change rather than rule following, Chapters 2 through 8 go far beyond the restrictive assumptions of Chapter 1 to make this a truly pathbreaking book that will have a long impact on the study of rules.

With the Stroke of a Pen: Executive Orders and Presidential Power. By Kenneth R. Mayer. Princeton: Princeton University Press, 2001. 298p. \$39.95.

George A. Krause, University of South Carolina

Given the recent events in the realm of presidential policymaking over the past decade, Kenneth R. Mayer has produced a timely book chronicling the use of executive orders that will be of considerable interest to political scientists, historians, legal scholars, and journalists alike. Existing research on the topic of executive orders has been largely addressed by constitutional legal scholars who possess little interest in emphasizing a generalizable understanding of this tool of executive authority. In recent years, a small yet growing-body of political science research has tried to obtain a social scientificmotivated portrait regarding the institutional and behavioral dimensions of executive order issuance by presidents. Mayer makes a strong case for using new institutional economics (NIE) as a "way of making sense of the wide range of executive orders issued over the years" (p. 28). The NIE theoretical approach that Mayer applies to presidential leadership takes a long-term view, compared to other works on presidential leadership, by positing "that presidents can achieve substantive (policy) results not simply by giving commands, but by creating and altering institutional structures and processes" (p. 29).

This book is comprised of three distinct components. The first is a general explanatory model of executive order activity by postwar U.S. presidents. The second is the application of NIE theory to several important cases where executive orders have strengthened presidential power in executive branch administration during the twentieth century: The Budget and Accounting Act of 1921 and Regulatory Review in the form of Executive Order (EO) 11821 in 1975 (requiring executive agencies to conduct price inflation impact statements on major regulations); EO 12291 in 1981 (requiring executive agencies to apply a cost-benefit analysis litmus test to determine the efficacy of proposed rules and regulations); EO 12498 in 1985 (requiring executive agencies under EO 12291 to publish an annual index of anticipated regulatory actions with the purpose of providing the Office of Management and Budget [OMB] with advance notice of new regulations that the latter could do away with if they were deemed to duplicate or conflict with existing rules); and EO 12866 in 1993 (imposing a 90-day time limit on OMB to review proposed rules, while also limiting this activity to those likely to impose more than \$100 million in costs). The third component is an analysis of legal authority underlying executive orders in the areas of civil rights and foreign policy.

The first component, pertaining to empirical examination of the aggregate use of executive orders by postwar U.S. presidents, is met with mixed success. The statistical model is both sophisticated and well conceived from an econometric and model specification standpoint and goes beyond existing studies based on "determinants of executive orders." The use of distributed lag effects to capture important shocks that might affect executive order issuance is a novel refinement to the current state of empirical research on this topic. Regrettably, the empirics are not connected in any meaningful way to NIE theory, which is the central thesis to this book, but instead

appear as a rather loose set of empirical generalizations with the subsequent results interpreted accordingly (see pp. 87-102). For instance, inclusion of the unified and divided government is not linked to strategic action within the context of executive order issuance in accordance with NIE theory. Relatedly, these findings appear to show mixed support for such a relationship (see Tables 3.4 and 3.5, pp. 98-100). Moreover, there is no inclusion of presidential policy preferences into the statistical model, save for dummy variables accounting for individual administrations consonant with the idiosyncratic presidency (pp. 87-94). Thus, the reader is left to wonder where presidents' policy preferences lie in relation to other institutional actors, and its implications for presidential action in a system of separated and shared powers that is commonplace in existing research using NIE as a theoretical paradigm.

The second component of this book makes some progress in our general understanding of the design and issuance of executive orders, yet falls short of reaching its full potential since it does not constitute an original theoretical contribution to the study of the presidency. Specifically, the theoretical insights imparted by the author are hardly novel for those already familiar with the literature on the institutional presidency penned by Terry Moe (and various collaborators) over the past decade and a half, for example, the view that "executive orders are an instrument of power that presidents have used to control policy, establish and maintain institutions, shape agendas, manage constituent relationships, and keep control of their political fate generally" (p. 28). This view not only is taken from Moe and Wilson (Terry M. Moe and Scott A. Wilson, "Presidents and the Politics of Structure," Law and Contemporary Problems 57 [Winter/Spring 1994]: 1–44), as aptly noted by the author in a corresponding endnote (Chapter 1, note 128, pp. 235-36), but is also practically indistinguishable from Moe's related NIE-motivated work on presidents' responsive competence of the executive branch (Terry M. Moe, "The Politicized Presidency," in John E. Chubb and Paul E. Peterson, eds., New Directions in American Politics, 1985), and presidential advantage over congressional institutions via unilateral action (Terry M. Moe, "The Presidency and the Bureaucracy: The Presidential Advantage," in Michael Nelson, ed., The Presidency and the Political System, 1995; Terry M. Moe and William Howell, "The Presidential Power of Unilateral Action," Journal of Law, Economics, and Organization 15 [March 1999]: 132-79). While the author's use of NIE theory to explain these case studies seems plausible, they do not add any new twists or original insights of their own that constitute a unique departure from our current theoretical understanding of the institutional presidency.

Furthermore, the author's theoretical argument could have been enhanced by explicitly considering rival explanations or hypotheses that might account for the evolution of presidential use of executive orders. For instance, the growing institutionalization of the presidency might not empower the officeholder in a monotonic fashion as implied by the author (p. 220), but instead serve as a double-edged sword that hinders presidential action as these structures develop and proliferate beyond an optimal size. Thus, executive orders are used less for discretionary policy purposes in such instances, but instead increasingly are employed for taming the institutional structures that were originally intended to provide the president with greater policymaking authority vis-à-vis other institutional actors. While the author is correct to infer that their NIE theoretical account is a valid way to examine how postwar U.S. presidents have utilized executive orders, it is by no means the only or, perhaps, even best story to account for this activity. Greater scrutiny to alternative accounts would have placed the author's theoretical argument on much stronger footing than is the case here.

The final component relating to the legal basis for executive orders is this volume's greatest strength. In both the areas of foreign policy (Chapter 5) and civil rights (Chapter 6), the author does an admirable job of bridging normative constitutional law analysis to new institutionalism. In doing so, this treatment provides an alternative explanation for the standard normative legal perspectives that is less nuanced (e.g., see Ruth P. Morgan. The President and Civil Rights Policy-Making by Executive Order, 1970; Philip J. Cooper, "By Order of the President: Administration by Executive Order and Proclamation," Administration and Society 18 [May 1986]: 232-62) by contending that presidents purposively used executive orders to constrain the feasible set of potential policies in a manner that is more preferable to them. One specific compelling instance involves President Eisenhower's issuance of Executive Order 10656 in 1956 that established the President's Board of Consultants on Foreign Intelligence Activities, which was designed to halt Senator Mike Mansfield's (D-MT) legislation that would establish a new centralized joint congressional oversight committee of intelligence activities (pp. 170-71). This is just one example among several in this component of the book, where issues of constitutional legality and purposive institutional action by presidents are conjoined in both a thoughtful and novel manner.

Although With the Stroke of a Pen falls short of making a novel theoretical contribution to the study of the presidency, this book admirably succeeds as an important substantive contribution to understanding how and why presidents use the oft-overlooked but essential tool of executive orders as a policymaking means to wield their influence. For this reason, Mayer has written a book that should be of keen interest to anyone wishing to learn about how executive orders fit into the larger landscape of the institutional presidency.

Congress, the President, and the Federal Reserve: The Politics of American Monetary Policy-Making. By Irwin L. Morris. Ann Arbor: University of Michigan Press, 2000. 190p. \$45.00 cloth, \$22.95 paper.

John Williams, University of California at Riverside

Political scientists have been fascinated with the role of the Federal Reserve in making monetary policy. It has long been recognized that the Fed has a tremendous amount of power for a regulatory agency that has so much independence from political bodies. Students of comparative monetary institutions have marveled at the contrast of United States policy to that of the rest of the world, with the exception of Germany's Bundesbank. Yet political scientists and economists continue to try to identify how politics shapes American monetary policy. Irwin Morris's book offers a major corrective to some of the flaws of earlier efforts.

Morris diverges on most extant literature on U.S. monetary policy by taking a multi-institutional approach. Most research is either executive, bureaucracy, or Congress oriented, but he explicitly analyzes the interaction of the president, the Fed, and congressional coalitions. The basic theoretical approach depends on a unidimensional assumption that Fed policy can be aligned from the left to right, from easy monetary policy to tight monetary policy.

The process of the basic model is as follows. The Fed chooses a policy course, Congress decides whether to overturn this policy, the president then may veto Congress's action, and Congress can override. I find this model interesting for what some would conclude to be an odd reason—its lack

of empirical veracity. Let me explain the latter and then I will elucidate the former. Everyone knows that Congress has been a very interested observer of monetary policy, especially in the turbulent period of the 1970s stagflation. There were threats from Congress to eliminate the independence of the Fed, threats that were never implemented. Of course, Congress has enacted many policies that have affected financial markets and thus the Fed's ability to make monetary policy. But the basic function of the Fed has remained relatively unchanged since its inception.

That said, Morris's basic model leads to keen insights. The basic model is one of hypotheticals. These hypotheticals determine the action of the Fed. That is, counterfactuals are what drive the results. If the Fed does not follow an equilibrium policy, then Congress may override it. But the Fed's actions depend on the institutional situation involving Congress and the president. While the theoretical analysis is not particularly sophisticated in a technical sense, his willingness to address the institutional process in such an abstract way is very intriguing. And I believe it pays off in his empirical analysis.

Morris's multi-institutional model also can be used for a more traditional focus. Many conclude that a major power of the president is in the power to appoint members of the Fed. The author convincingly argues that this is not so because the Fed's ideal point only marginally influences monetary policy direction. The evidence is convincing, and it is certainly consistent with recent trends in Fed policy.

This book is rich with empirical data. Morris produces an econometric model that attempts to show how congressional policy positions influence Fed policy. He creates a "pivot" variable from ADA scores and shows that this variable influences the real Federal Funds rate when controlling for many political and economic variables. I would quibble with the specification in the econometric analysis, and the analysis has all the problems associated with a reactions function model. In addition, I would like to see more dynamics in the model, as the author is forced to use generalized least squares to deal with serial correlation in the disturbance terms. It would be nice to see a Granger causality test so that we would have more confidence, in the presence of an analysis controlling for more dynamics, that the pivot variable would still be able to predict the real Federal Funds rate. But the analysis is certainly credible, and given that it derives from the theory, is at least a good first cut.

All this said, the analysis is based on a sophisticated view of monetary policy. However, it could be more sophisticated. Among monetary theorists, there are many very innovative ways in which scholars have been trying to identify monetary policy. The idea that the real Federal Funds rate is a good indicator because the Fed controls it is a bit irrelevant. The issue is that we need to uncover when rate increases are caused by policy changes and when rate increases are due to external factors. This is very difficult. So I do not fault Morris with using this measure of policy, but it would be nice if he made clear that it is, to some extent-according to whomever you talk with—faulty. Rather than fully defending the measure as he does in Chapter 6, it would be better to admit the flaws, balance the evidence, and give the results. His finding about the effect of the pivot variable is important—if submitted to more sensitivity analyses—and at least provides some validity about the choice of his dependent variable.

Very useful is the analysis of the organizational characteristics of the Fed in relation to Congress and the president. The synthesis of various ideas about the institutional position of the Fed is by itself a major contribution. Morris clearly is one of the most knowledgeable scholars about the institutional position of the Fed. Indeed, it is his keen knowledge of the institution that leads him to develop a multi-institutional

approach. Because the Fed is in such a unique institutional position, his clarifications, observations, and interpretations of the organizational processes that determine Fed behavior and policy are in themselves a major contribution.

In summary, this book has much to recommend it. There is a tendency among scholars to focus on a single causal explanation of policy. Morris recognized in his research that this would be a major mistake in trying to understand monetary policy in the United States. He uses rational choice theory to make predictions about policy choice, and his empirical analyses support his theoretical models. If a student came to me wanting to study the Fed, this would be the first book I would recommend reading.

Constituting Workers, Protecting Women: Gender, Law, and Labor in the Progressive and New Deal Years. By Julie Novkov. Ann Arbor: University of Michigan Press, 2001. 336p. \$44.50.

Carol Nackenoff, Swarthmore College

Trained in both law and political science, Julie Novkov has made a major contribution to an understanding of the transitions from the Progressive Era to the New Deal that will be especially important for new institutionalist scholars of the Supreme Court, for students of American political development, and for scholars of gender and politics, women's history, and labor history. It also instructs those activists both inside and outside the legal community who turn to the courts.

This is a richly theorized work that engages in a careful investigation ranging well beyond the confines of Supreme Court case law. Novkov's data come from all reported cases in state and federal courts from 1873 to 1937 that involved legal regulation of workers in the workplace. She finds the Supreme Court's position in *West Coast Hotel v. Parrish* foreshadowed by earlier rulings in state high courts. She also draws on arguments made before the Court and the arguments of advocates.

One new argument Novkov makes is that West Coast Hotel v. Parrish, a pivotal case of the 1937 New Deal Court, is actually a culmination of a line of development that began even prior to Lochner, rather than a repudiation of it. Reading against the traditional portrait in which West Coast Hotel is a radical break with the past and a capitulation of the Court to the will of Congress and the President, Novkov argues that the innovation lay in the extension of the standard developed for female workers to all workers. The new framework considers the extent to which the legal community came to envision male workers "as subjects in need of protection" (p. 270) as well. By "centering the gender of regulated workers in the analysis of the legal battles" (p. 2), Novkov instructs previous analysts of this era, including Howard Gillman, whose institutionalist approach she draws upon (The Constitution Besieged: The Rise and Demise of Lochner Era Police Powers Jurisprudence, 1993), how the intersection of women's history and labor history that prevailed in Lochner still helped direct the Court's reasoning in West Coast Hotel. While Bruce Ackerman, Robert Post, Cass Sunstein, Howard Gillman, and Barry Cushman have also contributed importantly to revisioning this era, they have not, in Novkov's view, recognized the centrality of gender in framing the debate over worker liberty and public interest.

The author also draws on scholars who have recently been reweaving constitutional narratives to take account of the significant role played by other actors in the interpretive community (e.g., Ronald Kahn, "Institutional Norms and the Historical Development of Supreme Court Politics: Changing 'Social Facts' and Doctrinal Development," in *The Supreme Court* 

in American Politics: New Institutionalist Interpretations, ed. Howard Gillman and Cornell Clayton, 1999; Charles Epp, "External Pressure and the Supreme Court's Agenda," in Supreme Court Decision-Making: New Institutionalist Approaches, ed. Cornell Clayton and Howard Gillman, 1999), engaging in a rich examination of what has been recently termed "outside-in" scholarship.

Novkov's work extends the recent body of scholarship on the role of maternalists in shaping the modern welfare state (e.g., Theda Skocpol, *Protecting Soldiers and Mothers*, 1995). The roots of modern employment law and the modern doctrine of liberty "have grown in deeply gendered ground," she argues (p. 35). In fact, "much of the doctrinal framework for the modern interventionist state arose through battles over female workers' proper relationships with the state" (p. 13).

Novkov is centrally concerned with the questions of how doctrinal change occurs. This is a richly complex process in which judges do not monopolize control; the process extends beyond the formal boundaries of law. Attorneys and activists also help shape the discussion over doctrine; in the Progressive Era, social science research conducted within a maternalist framework played an important role. During periods of contestation, decisions leave ambiguities and lacunae in doctrine that are taken up and used by other actors involved in the process of interpretation. Investigating doctrinal change requires Novkov to engage textual analysis of cases and briefs, as well as social debate over protective legislation.

The "period of negotiation," during which courts were addressing attempts, both inside and outside the legal community, to balance and channel tensions and conflicts occasioned by the rise of a modern industrial economy and a modern regulatory state, begins with Myra Bradwell's attempt to use the new Fourteenth Amendment to argue for substantive rights (liberty and equality). Novkov ends this period of negotiation with West Coast Hotel but continues her consideration briefly into the early 1940s.

A key concept in Novkov's analytical framework is that of "nodes of conflict." These are contested narrative spaces, or "moments in the development of doctrine during which the various groups of actors who have access to the legal community struggle among themselves and with each other to establish their interpretations of a particular legal concept or phrase as the dominant norm" (p. 16). She organizes her book around four such nodes or periods of investigation, devoting a chapter to each of them. The first node, from 1873 to roughly 1897, is described as a period of "generalized balancing" between Fourteenth Amendment liberty and more traditional police power, where the courts did not consider statutes in specifically gendered terms. The second period, from 1898 to roughly 1910, is characterized in terms of "specific balancing" between workers' liberties and the state's power to regulate; judges and lawyers began to advance a separate analysis for cases involving protective legislation for women. The third node of conflict, from 1911 until 1923, represents a shift toward "labor-centered analysis," in which women's legislation was foregrounded and courts looked at the laborers themselves that statutes sought to protect. Doctrinal lines in litigation concentrated primarily on women's characteristics, more than on the issues they faced as members of the working class. The final period, from Adkins (1923) through West Coast Hotel, was a period of "gendered rebalancing," in which debate over the legitimacy of minimum wages took place in the context of a larger question over "whether the state had the legal capacity to regulate the terms and conditions of labor for all workers" (p. 183). Novkov argues that this debate featured gender rather than class. Whether or not the periodization of these debates is quite as neatly delineated as she argues, the identification of areas of contestation in these four different nodes of conflict is extremely useful.

If Novkov's story is one in which New Deal workers are brought into the logic of protection developed during a struggle involving women's labor—so that class piggybacks on gender—is there any sense in which this story is a partial victory for and vindication of the maternalist strategy? For Novkov, "some paths bear more risks of co-optation by hostile actors than others" (p. 265), and maternalism was such a path. Women's organizations saw their political advocacy transformed into legal language, but Novkov tells a cautionary tale: "[R]eformers need to think carefully about the legal categories they create and how the next set of arguments down the road will transform these categories" (p. 265). Maternalist feminists should have been more wary of their allies; some judges and pro-regulation attorneys-general were seeking to validate statutes reinforcing traditional gender roles. Novkov yearns for a deeper rebalancing on the basis of gender than maternalists were able to achieve—one less dependent on the state's interest in reinforcing and protecting women's maternal roles. While one could wish for a fuller discussion of the consequences of the West Coast Hotel perspective for workers and for the relationship between work and citizenship in the New Deal era, Constituting Workers, Protecting Women is a powerful piece of scholarship.

**Democracy in Suburbia.** By J. Eric Oliver. Princeton: Princeton University Press, 2001. 263p. \$47.50 cloth, \$17.95 paper.

Dennis R. Judd, University of Illinois at Chicago

In this pathbreaking book, J. Eric Oliver proposes to answer an ambitious and important question: Has suburbanization brought about a decline of civic engagement in America? This question is, obviously, immensely important because more than half of all Americans live in suburbs. Whatever they think and how they vote and however much they participate in the civic life of their communities has enormous consequences, not only within the suburbs but also for the nation as a whole. The question is also consequential in light of the national debate that seems to have been provoked by the recent work on social capital. As Oliver notes, Robert Putnam has blamed suburbanization for part of the alleged loss in social capital in America. The general claim that suburbs have killed community and civic engagement is hardly new, and it has recently been amplified by (among others) advocates of the new urbanism. Oliver boldly states that "such claims are without any empirical basis" (p. 2), and he takes it as his task to supply the missing evidence that might answer the question. In doing so, he has produced a remarkable book, literally the first one ever published to present definitive evidence on the crucial issue of the impact of the suburbs on American democracy.

Oliver derives most of his data on political activity from the 1990 Citizen Participation Study conducted in 1989 and 1990. More than 15,000 Americans were interviewed by telephone to ascertain their voluntary and political activities and demographic characteristics, and more than 2,500 follow-up interviews were conducted to gather more detailed information. By merging data from this study with city- and metropolitanlevel census information on economic and social characteristics and data from the 1996 American National Elections Study, Oliver has constructed a unique series of data sets. By constructing contextual models employing multivariate regression analysis, he is able to bring to bear a formidable array of evidence to show that suburbia does influence civic participation.

Scholars have long assumed, and asserted, that small communities promote personal connections and civic participation. Oliver's evidence bears this out: His data show that the residents of small communities tend to contact local officials more, to attend board meetings and meetings of organizations, to vote more frequently in local elections, and to participate in informal civic activities. In general, these relationships hold even when social context varies significantly; city size matters to some degree, for example, regardless of varying education levels.

Things get much more ambiguous when Oliver considers the influence of social-class segregation on civic participation. He offers convincing evidence that metropolitan areas are highly segregated between rich and poor, and that municipal boundaries tend to match up with these patterns. He shows that populations trapped within poorer municipalities tend to participate at a lower rate, a finding that will surprise no one. But he also shows, somewhat unexpectedly, that people living in homogeneous affluent suburbs also participate less. Why is this so? According to Oliver, "the exclusionary practices that help create and sustain a suburb's affluence also limit the range of social problems and political conflicts within their borders" (p. 95). Homogeneity breeds boredom, while diversity within a governmental unit creates issues that sustain residents' interest. This finding offers a refreshing new angle on an old debate over the merits and consequences of governmental fragmentation. Should the suburbs be organized to encourage political engagement across class and racial lines, or should they be regarded merely as a marketplace offering people the "choice" of sorting themselves out? Not only does Oliver contest the basic premise of the public choice model by pointing out that only the affluent can exercise any reasonably free market choice (a familiar argument); he also arguesfrom his evidence—that political fragmentation breeds an escape from politics that erodes a "sense of connection and obligation to the larger society" (p. 98).

The relationships between racial segregation and civic participation appear to be more complex. Oliver's data show that the residents of predominantly white cities tend to participate less than do people living in racially mixed places, but there are many nuances. Many racially mixed cities may be "overpoliticized" because they tend to be more crowded and more beset by a variety of social problems. This fact may encourage people to escape to more peaceful pastures. When they do so, they may be striking a bargain to give up political engagement altogether.

Near the end of this book, Oliver reaches the conclusion that "America's current arrangement of local political institutions is not conducive to maximizing the civic capacity of its communities or promoting the benefits of civic engagement for its citizens" (pp. 2-6). Rarely do they live up to Oliver's "authentic governing principle" that "America's municipalities and other local institutions...should function so as to bring together most people within a geographic vicinity to collectively solve problems related to their area" (p. 5). Nor do contemporary governance arrangements nurture what Oliver calls "civic capacity," which he defines as "the extent to which a community's members are engaged in both political and civic activities" (p. 6). Are these goals so important that they justify a renewed commitment to reform metropolitan governance? Or are Americans more attached to the metropolis as marketplace than as fertile ground for civic engagement? Oliver's book allows us to bring a fresh perspective to such questions. It virtually forces the reader to step outside old debates and assumptions and examine anew the consequences of America's preference for fragmented governmental arrangements.

When the State Kills: Capital Punishment and the American Condition. By Austin Sarat. Princeton, NJ: Princeton University Press, 2001. 314p. \$29.95.

Andrew Norris, The University of Pennsylvania

As the United States begins fighting a war devoted not to the overthrow or liberation of a particular government but, rather, as Mr. Bush put it, to rid the world of "evildoers," it is easy to forget that our state is also busy at home killing people in the service of a similar oversimplified moralism. Austin Sarat's most recent book is, then, an important reminder. Since the Supreme Court reinstated capital punishment in 1976 the country's appetite for it has steadily increased: More than 3,600 people now sit on death row, and their numbers continue to swell. While there have been some welcome signs of a slackening in the nation's tolerance for the killing of the mentally retarded and the innocent, the Rehnquist court has been streamlining the appeal process in an attempt, in the Chief Justice's words, to "get on with it." Sarat rightly protests against the ensuing compromises of the rights of those caught up in the system, a disproportionate number of whom are, as everyone knows, poor and black. He argues that routine killing by the state is not just illiberal in its corrosive effect upon the Bill of Rights but in conflict with the institutions and spirit of our democracy. Where democracy calls for a willingness to seek reconciliation and the improvement of institutions through dialogue, and hence a willingness to admit that one's own perspective is limited and one's own judgment fallible, capital punishment requires that we assume the mantle of infallibility, and it is sustained by a spirit of rage that it in turn nurtures. One of the strongest features of Sarat's book is its insistence that none of this is accidental: "State killing... is part of a strategy of governance that makes us fearful and dependent on the illusion of state protection, that divides rather than unites, that promises simple solutions to complex problems" (p. 247). It is easier and less anxiety-producing to tell ourselves familiar comic book stories about the battle of good and evil than to get down to "the difficult, often frustrating work of understanding what in our society breeds such heinous acts of violence" (p. 14). And if we believe the stories we tell, it is hard to imagine living without the protection of a powerful and threatening state that can match the violent forces arrayed against us. For those who profit politically or financially from the present forms of that society, that is all to the better. Protego ergo obligo.

Sarat's response in this passionate and thoughtful book is to advocate what he terms "a new abolitionism," one that would eschew appeals to the sanctity of life, the moral horror of a state killing its own citizens, or the inherent cruelty of the death penalty. Each of these approaches focuses on the victims of state killing, and in part as a result of this they have all had little success in moving the American electorate, two-thirds of whom still support the death penalty (p. 12). Given this, we are better off challenging state killing on its own terms, instead of contesting the moral values and institutions with which it is bound up. Following the lead of Justice Blackmun's 1994 Callins v. Collins dissent and the American Bar Association's 1997 call for a moratorium on state killing, Sarat argues that the death penalty as currently administered violates due process, undermines our central legal values and the legitimacy of the law itself, and cannot reasonably be expected to be applied in ways that do not reflect the racism prevalent in our society (pp. 253, 255-56). The admission of none of this requires one to feel sympathy with the men and women on death row.

Sarat hardly limits himself to such arguments, however. His book considers state killing from a wide variety of political, moral, and analytic perspectives, and with 54 pages of notes it engages the relevant literature in political theory, public law, penology, and even narrative theory. All of this allows it to provide thoughtful considerations of topics as varied as the representation of capital trials and executions in popular culture, the attempt to make state killing (appear) painless so as to distinguish its victims from the victims of non-statesponsored killing, the contribution and self-understanding of death penalty lawyers, the role the jury plays in the legitimization of state killing in a democracy and the forces that encourage the members of juries to play that role, the manner in which the victim's rights movement draws upon a 60s-style distrust of the government even as it turns to the government for redress, and the way in which the recent allowance of victim impact statements in the sentencing stages of capital trials blurs the lines of private revenge and public retribution upon which the validity of public justice itself is built.

It is in defense of such a distinction that Sarat contests Wendy Lesser's claim that executions ought not to be televised: Capital punishment is by definition a public matter, involving as it does the state's response to the violation of its laws; it follows that it should take place in public. Moreover, performing executions in public will prevent us from continuing to hide from the truth of what we are doing. While Sarat is certainly right that our present hypocrisy serves us ill, not all of his readers will share his confidence in the American people here, and many will suspect that the general public would either become inured to or actually enjoy the sight of "evildoers" being killed. In the course of a discussion of the role of narrative construction and preservation in capital trials, Sarat cites Thurgood Marshall's wise observation that "whether a punishment is cruel and unusual depends, not on whether its mere mention 'shocks the conscience and sense of justice of the people,' but on whether people who were fully informed as to the purposes of the penalty and its liabilities would find the penalty shocking, unjust, and unacceptable" (pp. 182–83). Such education would, I think, be necessary for us to see what a televised execution is showing—and not showing. Sarat suggests that the debate that televised executions would provoke might be education enough (p. 208). And one might point to the secrecy within which the government has shrouded both executions and—since the Vietnam warwarfare as evidence that the state at least agrees with Sarat that the sight of our fellow citizens dying galvanizes us against the state that is killing them. But, as Sarat himself demonstrates, the state's search for a painless form of execution has led to the widespread embrace of a technique that "shows" almost nothing. One cannot feel confident that the slight exhale of breath of a man being killed by lethal injection will have the effect that the pictures of soldiers dying in Vietnam did. However, even if this objection is well taken, it hardly compromises the value of Sarat's book. Because if what we need is an education in the politics and injustice of capital punishment before we can (truly) see what we are doing, Sarat's book is an important contribution to that education.

Is the Fetus a Person? A Comparison of Policies Across the Fifty States. By Jean Reith Schroedel. Ithaca, NY: Cornell University Press, 2000. 256p. \$29.95.

Alesha E. Doan, California Polytechnic State University

The conceptual—and legal—division between a woman and a fetus is most recently rooted in the Supreme Court's 1973 Roe v. Wade decision, which established the trimester framework designed to balance a woman's right to privacy with the state's interest in protecting potential life. Prior to Roe, a woman and her fetus were legally viewed as having identical interests because of their biological tie. The trimester framework,

however, established a precedent for viewing the maternal-fetal relationship as an adversarial one, where a woman and her fetus have conflicting interests. Indeed, as states demonstrate their willingness to protect fetal health—via restrictions on access to abortion—the fetus is increasingly being viewed as a separate entity that is entitled to protection and recognition as a person. The questions of when and under what conditions a fetus is a person have policy implications beyond the scope of the abortion debate.

Jean Reith Schroedel's Is the Fetus a Person? is a wellresearched book that makes a unique contribution to our understanding of reproductive policy. Schroedel examines three seemingly unrelated reproductive policies that are actually linked by the question of fetal personhood—abortion, substance abuse by pregnant women, and third-party fetal killing. While these policies are related, the political rhetoric used to discuss them, and the policy outcomes regulating each, is radically different. Exploring the inconsistencies and differences—within and across states' policies—regarding the legal status of a fetus is the crux of this book. For example, why is the state more inclined to establish abortion policies protecting a fetus—essentially granting it greater personhood status—in the third trimester of pregnancy, but reticent to create the same protection from domestic violence? Similarly, why do states' policy approaches to substance abuse by pregnant women vary from punitive-based policies, which view the interests of the mother and fetus separately, to treatmentbased policies where they are treated as having identical interests? To answer these questions (and many more), she provides a thorough historical account of fetal policies and, it is important to note, amasses an impressive data set examining each policy area.

Schroedel begins by linking together abortion, substance abuse by pregnant women, and third-party fetal killing by providing a detailed, analytical history of fetal personhood throughout the centuries. She explores the moral and legal nexus of these three issues, highlighting significant theological shifts, that have influenced policy development over time. Relatedly, as technology has advanced, the state has accorded a fetus more legal rights and an elevated personhood status, yet the personhood status of women has remained fairly stagnant over time, providing the state with more leverage to regulate the behavior of women. She uses the historical lessons to hint at an important empirical and theoretical finding in her research: Viewing the fetal-maternal relationship as one of competing interests leads to poor policymaking for prenatal drug exposure and third-party fetal battering (women and their fetuses fundamentally have a joint interest in ending addiction or battering).

In the next two chapters, Schroedel examines each policy in detail, attempting to answer the underlying question of whose rights—or personhood—matters more, a woman's or a fetus's. She compiles state-level data on abortion, fetal substance abuse, and third-party fetal battering policies. Unlike in other studies, the author does not simply count the number of policies in each state; rather, she creates indices, which weigh the significance of every regulation within the three policy areas. Chapters 3 and 4 conclude with a comprehensive and systematic picture of abortion, fetal substance abuse, and fetal battering policies across the United States.

Schroedel begins to unravel the variance in states' policy responses to these issues. Using rhetoric advanced by the prochoice and pro-life camps, she derives and tests several hypotheses. In particular, she examines the pro-life claim that the fetus is synonymous with "person" and should be protected at all stages of development. Logically, states that are pro-life (measured by the severity of abortion restrictions) should exhibit similar patterns in the other two policy ar-

eas (drug exposure and battery). It is interesting that her analysis—which contains a blend of qualitative and quantitative methods—suggests that empirically, there is no support for this proposition. Pro-life states are not committed to promoting the well-being of the fetus beyond abortion decisions, as evidenced by their lack of comprehensive policies. "Simply, pro-life states make it difficult for women to have abortions, but they do not help these women provide for the children once born" (p. 157), the author writes. Her analysis demonstrates that women are consistently accorded a lower economic, social, and political status in pro-life states. While this is not a novel discovery, her analysis is unique in that it examines the relationship between the status of women and fetal personhood in a range of reproductive policy areas.

In short, Is a Fetus a Person? has much to offer. It provides a comprehensive map of abortion, fetal drug abuse, and fetal battering policies. Schroedel painstakingly compiles a thorough data set containing all criminal laws relating to fetal personhood status and creates several empirical tests aimed at explaining the differential treatment of these reproductive policies across the 50 states. Unfortunately, the book does not provide a comprehensive theoretical framework for other scholars to apply.

Schroedel discusses abortion, fetal drug abuse, and fetal battering policies as morality policies. She asserts that the morality politics framework only works as a starting point for her research because it fails to adequately account for policymaking in fetal drug abuse and fetal battering policies: "I believe its application must be extended to a broader range of political circumstances to account for status differences among the parties that harm the fetus and for the impact of cultural values" (p. 62). Extending and improving on the morality framework would indeed be a significant theoretical contribution to the field; however, this book falls short in this endeavor. Although the theoretical omission is disappointing, Schroedel delivers a wealth of information and suggests a road for future studies on reproductive policies. Is the Fetus a Person? is one of the first books to examine the policy implications and consequences of expanded definitions of fetal personhood beyond abortion policy. This book will be of interest to students of state politics, reproductive policies, and gender politics.

Trading Blows: Party Competition and U.S. Trade Policy in a Globalizing Era. By James Shoch. Chapel Hill: University of North Carolina Press, 2001. 388p. \$59.95 cloth, \$19.95 paper.

Frederick Mayer, Duke University

In this history of American trade politics, James Shoch argues for the centrality of political parties in the making of trade policy. His thesis, simply stated, is that parties matter, and matter a good deal more than the literature generally acknowledges. As he depicts it, the historical record is something like a heavyweight prizefight, in which the Democratic and Republican Parties, driven by constituency pressures, ideological differences, and, especially, the quest for political advantage, spar ceaselessly over trade issues.

A focus on partisanship is timely, given the increasingly partisan nature of American trade politics in the last decade. Since the passage of the North American Free Trade Agreement (NAFTA) in 1993 and the General Agreement on Tariffs and Trade (GATT) in 1994, both with substantial Democratic support, Congress has become increasingly divided along party lines. The almost straight party-line vote in 2001 on the (shamelessly named) "Bipartisan Trade Promotion Bill" demonstrates just how sharply divided the two

parties have become. Shoch's book reminds us that partisanship is nothing new, and that the bipartisan consensus on trade that largely prevailed from the end of World War II is not the historical norm.

Trading Blows traces trade politics from the Civil War to the present, giving considerably more attention to recent history than past. In his first chapter, Shoch sketches a "multilevel analytic framework," on which the subsequent "analytic narrative" draws. His framework incorporates an extraordinarily wide range of theoretical constructs, among them critical realism, rational choice, new institutionalism, political economy, trade theory, public opinion, and others. The theoretical discussion is comprehensive and insightful.

Ultimately, however, the book's strength is its rich description of trade politics, particularly of the inside political maneuverings of presidents and congressional leaders as they seek to advance their political and policy interests. The interpretation is clearly informed by theory, but it is not driven by it, in that the author draws on whatever theoretical framework seems best to apply. One could quibble that at times the interpretations offer such complex explanations for phenomena that it is difficult to determine what really matters, but on the whole this is preferable to the kind of reductionism that plagues some more theoretically driven analyses.

The value of Shoch's approach is most evident in chapters on the elections of 1994 and 1996, which describe the culmination of a long process in which the Democratic and Republican Parties switched sides on trade. He shows how after Republicans captured control of Congress in 1994, the increase in union activity and campaign contributions and the simultaneous decrease in business support for Democrats altered the pattern of constituency pressures on members of Congress and led to much greater polarization on trade. Although Democrats supported GATT in 1995, there was almost no Democratic support for President Clinton's request for new "fast track" negotiating authority in 1997, despite strong pleas from a president of their own party.

Notwithstanding its many strengths, *Trading Blows*, by focusing so much attention on party conflict, tends at times to overstate the degree of conflict and to underplay the importance of other factors at work in trade politics and trade policymaking. For example, in his characterization of the politics of the 1980s, Shoch contests the dominant view that the high degree of consensus on trade policy that characterized the post-World War II era continued into the 1990s (see, most notably, I. M. Destler, American Trade Politics, 1995). Shoch argues that this consensus was always somewhat less than claimed and that by the 1980s, during the Reagan and Bush I administrations, there was a good deal more conflict than generally admitted. It is true, as he documents, that the growing trade deficit, particularly with Japan, led to complaints about "unfair" trade practices, that this complaint found its way into Democrat-sponsored legislation with elements of reciprocity, and that Republicans tacked to co-opt the Democratic position. But on the whole, and on the big issues, the consensus held. The United States did not raise its tariffs, it negotiated and signed a free trade agreement with Canada, and it launched the Uruguay Round of the GATT, all with broad bipartisan support. Indeed, bipartisanship largely held, despite signs of its imminent demise, for the NAFTA and GATT votes in the first two years of the Clinton administration.

In part because it somewhat overstates the conflicts of the 1980s, and in part because its focus is primarily on the inside maneuverings of policymakers, *Trading Blows* somewhat understates the sea change in the political environment for trade that took place in the 1990s. Although it passed, NAFTA deeply politicized trade in a way that had not been seen for half a century. The political forces in the society that engaged in the NAFTA tussle, far from disbanding after the vote, stayed on the scene. Not only did the labor unions remain primed for battle, so too did the host of environmental, civic, religious, and other organizations that first surfaced in 1993. Shoch largely ignores this phenomenon, and the larger antiglobalization movement it has become.

The characterization of the politics of trade in the book also misses a subtle shift in the nature of trade issues. For the most part, Trading Blows characterizes trade policy as contested along a single free trade versus protectionist dimension. For most of American history, this was the essential question. But it is certainly no longer the only policy question. For more than two decades now, the United States has had a weighted average tariff of less than 5%. To be sure, we continue to protect certain of our industries (textiles, sugar, and steel top most lists), and the degree of protection afforded them remains an issue, but for most of the economy, on the traditional issues of tariffs and quotas, the game is largely over. Many of the core issues today are not so much about free trade as about regulation: worker rights, environmental standards and enforcement, intellectual property, food safety, and the like. These issues engage different actors in society, resonate differently with public opinion, and engage political parties in different ways.

Notwithstanding these minor shortcomings, *Trading Blows* is a fine book that largely accomplishes what it sets out to do. It demonstrates the value of close historical analysis illuminated by theory, and makes a compelling case for the importance of partisan calculation in trade politics and policy. It is an informed and insightful addition to the literature on American trade politics.

Uncertain Hazards: Environmental Activists and Scientific Proof. By Sylvia Noble Tesh. Ithaca, NY: Cornell University Press, 2000. 192p. \$35.00 cloth, \$16.95 paper.

Richard A. Harris, Rutgers University-Camden

Uncertain Hazards is an ambitious book, in two respects. First, it tackles an important issue for political science as well as sociology and history, namely, the impact that social movements have on reshaping the societies in which they mobilize. Second, in adopting a case study approach to this issue, the author explores the development of the modern environmental movement and its purported reframing or hegemonic reversal of environmental science and risk assessment in America. In effect, this volume is two separate but related studies. Indeed, Sylvia Noble Tesh suggests as much when she notes in her acknowledgments that her "theme shifted as the book took shape" (p. xi).

One of the critical insights developed by Tesh is that the environmental movement ought not be viewed as a unified or monolithic entity. By carefully organizing her analysis of environmental organizations into the "mainstream group" most familiar to students of environmental politics (e.g., Sierra Club, NRDC, National Wildlife Federation, etc.), "grassroots groups" usually formed locally around public health issues, and "grassroots support groups" that provide scientific, organizational, and political back-up to local groups, she provides a richly textured and nuanced analysis of the environmental movement.

Tesh also rescues the topic on risk assessment from the sterile debate between those who hold that risk assessment is a legitimate economic/scientific basis for making policy decisions and those who would maintain that it is merely a Trojan horse for providing regulatory relief to business interests. She persuasively argues that risk assessment and, for that matter,

environmental science reflect an approach that environmentalism has successfully challenged by reframing not only the questions asked, but also the standards of evaluation used in policy analysis.

These significant contributions notwithstanding, Uncertain Hazards does display certain limitations. Perhaps these are inevitable given the ambitious, dual assignment of analyzing both the role of social movements in society and the clash between environmentalism and science that Tesh has taken on. One of the most surprising things about this book is the paucity of references to the extensive literature on environmental politics and public interest groups. These are both well-developed fields of study, and except for works of wellknown environmental advocates, such as Rachel Carson or Barry Commoner and some newer students of environmental policy, Tesh does not take advantage of this body of work. Scholars such as Linton Caldwell and Walter Rosenbaum clearly come to mind when thinking about key environmental politics scholars, as does Samuel Hays when thinking of social/intellectual historians who have studied environmentalism. More broadly, the work of Andrew McFarland and Jeffrey Berry bears directly on the issues of public interest advocacy or influence.

The danger of overlooking this scholarship is suggested by Tesh's claim that only in recent years have we begun to move beyond Rachel Carson's concern with carcinogenic pollutants to consider "a connection between environmental pollution and other outcomes in wildlife and nature" (p. 67). In fact, connections between pollution and asthma or endangered species have been part of environmental advocates' stock-intrade since the early 1970s. Indeed, the same can be said of her assertion that the "first big rush of publicity singling out children as especially vulnerable to environmental toxins came in 1989" (p. 70). An examination of testimony at congressional hearings on the Clean Air Act of 1975 or the buildup to the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) in the late seventies clearly shows that the special vulnerability of children and the elderly figured prominently in public debate. Moreover, the Endangered Species Act indicates that concern with wildlife has long occupied a place in environmental policy.

One may also question whether Tesh's assertion that "science is a social construct" (p. 2) is a bit overdrawn. Few would dispute her claim, developed in a chapter on environmental science, that the experience and views of scientists help to explain the questions they investigate. Nor is her exposition on the importance of Kuhnian paradigm shifts particularly controversial. However, to the extent that science, even environmental science, is a method predicated on posing falsifiable hypotheses, it is distinguished from metaphysical argument, that is, ethical or political principles. This is not to suggest that ethical or political arguments are any less legitimate in policy debate; indeed, it is arguable that they should have more standing. However, the two kinds of claims, scientific and metaphysical, should not be conflated as Tesh intimates in her examination of guiding environmental principles.

Finally, the quite appropriate point that the relationship between society and social movements is a two-way street could have been connected to the substantial body of work on the Progressive Era and the New Deal, which clearly draws a connection between the labor, women's, and agrarian reform movements on the one hand and the rise of modern liberalism on the other. This work by historians and new institutionalists buttresses Tesh's argument and may well have shed considerable insight on her analysis. While she does draw an important contrast between classical liberalism and environmentalism, which purportedly reflects a Gramscian or new left view of the world, her work missed an opportunity to acknowledge

the debt that environmentalists owe to the modern liberal political tradition. In fact, it might be interesting to contemplate the possibility that mainstream environmental groups fit into the modern liberal tradition, while grassroots and grassroots support groups do indeed fit the Gramscian tradition. This possibility would suggest an interesting dynamic within the environmental movement.

Regardless of the questions raised above, *Uncertain Hazards* will provide all students of social movements and environmental politics with a challenging and provocative read.

From Neighborhood to Nation: The Democratic Foundations of Civil Society. By Kenneth Thomson. Hanover, NH: University Press of New England, 2001. 195p. \$50.00 cloth, \$19.95 paper.

Richard M. Flanagan, The College of Staten Island, CUNY

It was New York Governor Al Smith's famous dictum that the ills of democracy could be solved with more democracy. Many agree with him some 75 years later. The shelves of political science overflow with books lamenting the decline of intermediary institutions that once plugged the hearts and minds of citizens into government and civic life. Democracy scaled down to the town and neighborhood allows people to address problems that are experienced in the routine of everyday life. Stripped of abstraction, politics loses its mystery and the sense of alienation that accompanies it. But Americans no longer gather at the political club, the town meeting, the church, and the union hall. Citizens are plugged into television, the family, or perhaps the job, interested in private concerns. In response, pundits, professors, and politicians call for a revival of local political and civic life. President George W. Bush's "Faith-Based Initiative," which would use federal funds to support church social service programs, can be viewed as a response to the national mood of a people adrift. While many have forwarded tiresome critiques of what ails us, Kenneth Thomson does the nitty-gritty empirical work that should mark social science's unique contribution to this debate.

Thomson, a coauthor of the award-wining book that surveyed individual attitudes in the cities, *The Rebirth of Urban Democracy* (1993), mines the data collected from that project, shifting the level of analysis up a level to analyze organizational forms and functions. Attention turns to neighborhood associations in four cities: Birmingham, Dayton, Portland, and St. Paul. These cities take their officially recognized neighborhood associations seriously, providing funding to make them work, and involving them in an advisory policy role.

Thomson devised an innovative index to measure the strength of neighborhood associations, capturing such characteristics as staff size, meeting frequency, and attendance, as well as 18 other measures of organizational activity. Multivariate analysis leads him to the most important finding of the book: Well-organized, active neighborhood associations have an independent, positive impact on participation in local politics, holding constant for socioeconomic status. Community-based organizing, if it is done right, pulls people out of their personal bubbles into political life.

The author also developed a normative model for analyzing the success of community organizations that focuses on three measures: the participatory core, the link to the community, and the link to government policymaking. Vital neighborhood organizations are democratically run, seek out new members, and have a real impact on policy. Thompson found that for the most part, neighborhood organizations are run by a good cross section of neighborhood residents and allow

for open debate on matters of community concern. Most residents are satisfied that their neighborhood group is run fairly. The author also found that neighborhood organizations reach out to residents and involve them in the political process, including many people who would not otherwise be involved in politics. On the third element of the model, the policymaking link, the neighborhood organizations miss the mark. While they do a fine job of solving neighborhood-level problems and have the potential to tackle broader matters, they seldom do. The mind-set of the neighborhood organizations and citywide elected officials is unimaginative, leaving the beneficial effects of small-scale participatory democracy at the border of the neighborhood. Thomson suggests that this policymaking link could be improved if citizens clamored for change. There is nothing inherent in local participatory democracy that prevents the neighborhood organizations from dealing with a broader set of citywide, state, and national issues. It should also be noted that the more active neighborhood organizations were more likely to meet the requirements of the normative model, demonstrating the reparative impact of democratic action on democratic health. He argues that the more we invest in local democratic institutions like neighborhood organizations with funding support and legitimacy, the greater the return, in terms of citizen trust, efficacy, and deliberative, participatory democracy.

This short work raised questions that I wished had been addressed, since Thomson has the training, knowledge, and careful eye to weigh in thoughtfully. The author does not probe the dark side of neighborhood life. Fear of the outsider is among the most effective tools of participatory politics. The commonly heard lament of "not in my back yard" and the historical practice of exclusionary housing covenants designed to keep blacks and others out suggest that it is not axiomatic that illiberal impulses will be held in check by more participatory forms. Like many communitarian social scientists, Thomson is cagey about the concrete policies new procedural reforms will create. The other matter left unaddressed is a central claim of the book and title, the idea that neighborhood associations can wrestle with national-level problems and devise national-level policies. As the author notes, the neighborhood associations in the study had little interest in or impact on citywide problems. It is difficult to see how local institutions can make the great leap into state and federal politics. The great advantage of the neighborhood associations is that they tackle bite-sized problems that residents have a tangible stake in resolving. The inherent "meat and potatoes" conservatism evident in such matters provides a simple, democratic education that might be jeopardized if the neighborhood associations wade into more abstract, ideological waters.

From Neighborhood to Nation is an important contribution to the literature on participatory democracy, citizen politics, and local politics. Thomson has given political scientists important conceptual tools and empirical measures of grassroots organizations that can be replicated in future studies.

Death and the Statesman: The Culture and Psychology of U.S. Leaders During War. By Joseph B. Underhill-Cady. New York: Palgrave, 2001. 256p. \$39.95.

Patricia Lee Sykes, American University

Death and the Statesman appeared in print one month after the terrorist attacks on September 11, and the timing of its publication alone might attract a wide audience. The book deals with a significant subject of immediate interest to scholars and citizens alike—namely, what drives political leaders as they decide when and how to conduct war. Joseph Underhill-Cady argues that members of the foreign policymaking elite

remain preoccupied with their own mortality. He suggests how their metaphors and rituals reveal their persistent fear and high anxiety about death, and he shows how their decisions to go to war can be read to reflect this preoccupation. For the foreign policy elite, the conduct of war constitutes an "immortality project." According to the author, "As the elite sought to overcome their physical limitations, they likewise attempted to ensure the nation's transcendence of its mortal bounds" (p. 10). Underhill-Cady notes the genderspecific nature of foreign policymaking (p. 45). Macho men deny the inevitability of their own deaths and suppress their emotions, while they labor to ensure that the nation shall long endure. He traces the roots of their immortality projects to the Christian tradition: Man has fallen, but he can achieve salvation and thereby gain eternal life (pp. 52–55). The author renders a plausible, thought-provoking argument, although the evidence he produces could be more convincing.

Underhill-Cady constructs his narrative along the following lines. Chapter 1 critiques some of the literature in international relations and focuses on the limits of rational choice reasoning. Chapter 2 presents the author's alternative approach, which he describes as an analysis "based on political culture and the ontological concerns of foreign policy makers" (p. 10). According to the author, elite decisionmakers conduct their immortality projects at three levels—as individuals (Chapter 3), as government officials (Chapter 4), and as a nation at war (Chapter 5). Finally, the book concludes with speculation about twentieth-century changes in the conduct of war and the implications of high-tech warfare. The final chapter also includes the author's advice to policymakers that they embrace a more feminine "acceptant discourse" (p. 154). To many readers, the author's extensive (albeit basic) critique of rational choice reasoning and his concluding advice will seem strangely out of sync with the spirit of poststructuralism that otherwise informs his study.

As a cultural study of U.S. leaders, this book falls short of its goal. The author fails to identify any metaphor or trope that might be construed as uniquely American. When he explains why his study focuses exclusively on the United States, he cites practical constraints, including "the fact that I live in the United States" (p. 6). If that were a valid reason, then no political scientist in the country would study any other nation. As a source of popular culture, the author extracts metaphors from James Bond films. As he explains, "Bond is the epitome of the unemotional, 'civilized' man who embodies the illusion of being able to control and overcome all contingency and opposition in the world" (p. 121). Bond is also British. Throughout the book, the author refers to Anglo-Saxon culture and Anglo-American sensibility. (For examples, see pp. 122-23.) His understanding of the foreign policy elite appears to include decision makers in other Anglo nations. In fact, if the fear of death drives decision making and if that fear is universal, then the book's central argument would apply to all world leaders.

Readers might also question why Underhill-Cady chose particular leaders as subjects for his study. He focuses on (but does not limit his analysis to) Theodore Roosevelt, his Secretary of State John Hay, Senator George Hoar, Secretary of the Navy John Long, Secretary of State Dean Acheson, Secretary of Defense Robert McNamara, Lyndon B. Johnson, and George Herbert Walker Bush. The author states that he selected these subjects because he "found enough in common among them... to describe an evolving culture among foreign policy officials" (p. 7). He implies that he picked the people whose rhetoric and rituals suited his own narrative. He also explains, "I was interested in those campaigns in which the direct threat to the United States was relatively small, and where America might actually be seen as the aggressor, for

it is in those instances that justification of death in battle becomes most difficult" (p. 8). In that case, when focusing on George Herbert Walker Bush, why include the Gulf War but totally exclude "Operation Just Cause" (the U.S. invasion of Panama)? In addition to the seemingly arbitrary selection of subjects, the author's inclination to jump back and forth between cases might leave most readers (unable to identify the Secretary of the Navy during the Spanish American War) a bit bewildered and confused by the cast of characters.

Underhill-Cady's selection of textual evidence might also leave readers unconvinced by his argument. He examines narratives, metaphors, and tropes that he extracts from their context and often takes from secondary sources. (Early in the book, he warns us, "My research consisted of reading extensively about these powerful American men who made decisions about war, and finding passages or events about them that struck me as odd or interesting" [p. 3].) On page 38, for example, the author writes that LBJ "often used the metaphors of paralysis and raging rivers in his discussion of policy," and then he cites Doris Kearns Goodwin's book Lyndon Johnson and the American Dream (1976). Underhill-Cady might have followed up that statement by providing examples or illustrations of LBJ's use of those metaphors, but instead he switches to an exploration of the words and actions of another political actor. Later in the text when he returns to LBJ, the author does include direct language, but once again, he relies on Goodwin's text as the source. He states that following Kennedy's assassination, LBJ described the elite as "like a bunch of cattle caught in a swamp...simply circling 'round and 'round," and Johnson added, "I could not allow the tide of grief to overwhelm me" (p. 84, n. 44). A lengthier quotation in which LBJ describes the Great Society as an aging woman appears on page 111, but the author also takes this quotation from Goodwin's book. Readers might wonder whether they are learning more about the fears and preoccupations of Doris Kearns Goodwin than those of LBJ. The highly selective nature of quotations and the author's reliance on secondary accounts leaves readers suspecting that he has overlooked alternative narratives.

In the last chapter, Underhill-Cady does discuss one alternative narrative, which those who construct immortality projects sometimes express. Occasionally, members of the elite have assumed a more passive stance, entertained selfdoubt, acknowledged their own shortcomings, and even identified with the enemy (p. 154). The author expresses the hope that the elite will assume this feminine posture more often, and he advises decision makers to become more self-aware. Even if this happens, the consequences remain unclear, as the author explicitly denies any causal link between psychological health and the outcome of decision making (p. 153). Moreover, both time and place might dash his hopes. If the presidency and the foreign policy establishment are masculine institutions—demanding strength, determination, and firm conviction—then it will be difficult for the elite working in these institutions to express their doubts and emotions or assume an acceptant stance. (Even in the chapter that deals with actors as government officials, the author fails to entertain the possibility that institutions might influence the character of elite discourse.) Furthermore, junctures in political development might determine the nature of discourse. The author observes a shift throughout the twentieth century as war becomes technologically driven, but he neglects fluctuations. Perhaps even "time" can be construed as masculine or feminine. In 2001 in the White House, Cowboys replaced the Sensitive New Age Guys. Now the message is "Wanted dead or alive," not "I feel your pain." The men in the current administration are unlikely to acknowledge and explore their feminine side.

For all its limitations, Underhill-Cady's study invites us to listen closely to foreign policy decision makers today. Will technology reduce the psychological and emotional costs of war, as Underhill-Cady suggests (p. 167), making it even more difficult to discuss death? Listen to Vice President Richard Cheney talk about his heart: He describes in detail the wonders of the mechanical device that keeps his heart ticking and sets its pace. Perhaps more revealing, consider how President George W. Bush recalls his recent brush with death. While sitting alone watching television, he chokes, passes out—the fate of a nation of couch potatoes? (pp. 101-2)then awakens and recovers. Jokingly, Bush explains: "My mother always told me to chew my food carefully before I swallow." Does he render a metaphor for how America will conduct its "New War"? Perhaps we should be alert and attentive to the metaphors and rituals this president displays. After all, he has already been reborn.

**The Politics of Empowerment.** By Robert Weissberg. Westport, CT: Praeger, 1999. 272p. \$50.00.

William E. Nelson, Jr., The Ohio State University

The Civil Rights Movement of the 1960s produced strong pressure on all levels of government to give "power to the people." This urgent demand came not only from radical activists in the streets but also from the halls of academia, where scholars churned out a massive volume of studies encompassing detailed recommendations for filling the power vacuum between authoritative public and private decision makers and disadvantaged citizens whose lack of sufficient economic and political resources condemned them to the bottom rungs of the American social order. Although most of these studies were considered positive and progressive, they were not without their detractors. The most searing critique of "bottom up" schemes for empowering the disadvantaged has come from the pen of Robert Weissberg in his book, *The Politics of Empowerment*.

Weissberg advances the argument that the calls for self-determination and autonomous control by the disadvantaged are naive, unrealistic, and irretrievably flawed. It is his position that admonitions of this kind are unnecessarily radical and disruptive. They anticipate a major transformation of societal relations, and seek to radically alter the fundamental foundations of our social and political existence. They also discourage consideration of more realistic alternatives. Thus, destitute people seeking a remedy for their pauperism might be better served by learning a trade or taking classes in English literacy and mathematics than by joining a community organization and mobilizing for control over welfare bureaucracies.

The main lines of Weissberg's arguments run in the following direction. If poor people wish to achieve a higher bundle of benefits, they must earn them like everyone else. Community leaders who do not inform their constituents that the capacity on the part of government to deliver extraordinary benefits is limited are doing them a disservice; they are guilty of imparting to them unrealistic expectations that create conflict without advancing opportunities for genuine progress. Real empowerment for the poor must rest on the old-fashioned American values of obedience, duty, and respect. Political mobilization must be seen as one item on a broad and diverse menu that must be created to achieve massbased social justice in a democratic society. And poor people must understand that the mobilization process requires that they forge alliances with others and defer to the superior resources and wisdom of those who occupy higher positions on the power continuum. They must know that self-subjugation

to overwhelming authority is not an automatic recipe for poverty and misery. They must also learn to live with low rather than high expectations, since it is well established that achieving power is not especially effective in securing economic benefits, personal happiness, or social acceptance. Those who counsel them otherwise are acting irresponsibly. In the final analysis, this society may have to face the fact that the best remedy for poverty is to help the poor accept their lot as inevitable. Clearly, we cannot continue to blame society for the inept decision making by the poor that has consigned them to their own misery. To the extent that empowerment advocates ignore the innate weaknesses in the human personality of the unfortunate, they contribute to the escalation of urban social problems and make it more difficult to devise realistic solutions to the dilemmas of the poor.

In one major section of the book, Weissberg attempts an analysis of the black empowerment movement to demonstrate the major fallacies inherent in empowerment theories. He believes that the black model is an extremely important one because most black people have bought into the connection between empowerment and expanded societal benefits, and because the black empowerment movement has given birth to empowerment campaigns by other groups. Weissberg believes that one major problem with the black empowerment model is its reliance on electoral politics as a method for advancing the interest of blacks in society. This analysis, he contends, overlooks the fact that blacks are a hopeless minority in the country and can therefore exercise only a sliver of political power nationally, despite major gains in their election to public office since the passage of the 1965 Voting Rights Act. The widely touted potential benefits of electoral politics are also undermined by constraints endemic in the American constitutional system. In a constitutional democracy like the one operative in the United States, the government cannot control all of the social and economic forces required to achieve the objectives of black empowerment legally. Thus, if white businesses decide to leave a city governed by a black mayor, and this decision undermines the city's tax base, the government is in no position to command these businesses to stay or, once having left, to return.

Constitutional constraints aside, Weissberg contends that a variety of other factors prevent the translation of black empowerment in theory into empowerment in fact. In this context, he points to the weak and factional nature of black politics. Black mayors have failed to build permanent organizations and are challenged by black factions that are disappointed in their seeming inability to radically transform local government, and by white factions that oppose their efforts to satisfy escalating black demands for a wide range of social and economic benefits. Black empowerment is further undermined by the black infatuation with the "cult of personality," the yawning disconnect between mobilization and benefit delivery, growing dependence by black politicians on coalition politics as the principle avenue to elective office, and the incapacity of black mayors to satisfy public demands for the delivery of quality services by filling city bureaucracies with competent black employees.

Weissberg's The Politics of Empowerment is a political tract disguised as an academic treatise. It is one thing to argue that black politics is in internal disarray; it is quite another to argue that it has not been productive. The proof is in the pudding. Black mayors have not liberated black communities, but they have brought social and economic benefits to their constituents that would not have been available in their absence. To say that the distributional networks in major American cities have not altered is to ignore 30 years of critical development in American local politics. Both the symbols and the substance of racial politics in these cities have changed. The

changes have been both external and internal to the black community.

Externally, it is virtually impossible to build winning electoral coalitions in major American cities without the pivotal involvement of the black community. This fact may not always produce black control, but it does guarantee influence. It is a fundamental mistake to confuse the two conditions, as Weissberg does over and over again in his book. Internally, black political mobilization has produced a highly significant transformation in the psychological bearing of the black community. Blacks all across the country now approach the ballot box with a high degree of political and racial consciousness. This means, among other things, that they are voting instrumentally, and not at the blandishments of white-dominated political organizations. Instrumental black voting represents a sea change in black political behavior from the model of machine politics that pervaded the political landscape of many cities in the 1940s and 1950s. Weissberg's book does not capture this shift in black perspective because it is the product of armchair speculation disconnected from the foundations of black politics in America.

Weissberg refuses to acknowledge the reality of institutional racism in America. In *The Politics of Empowerment*, he constantly intimates that problems in the black community issue basically from weaknesses in the character traits of the black population. This blame-the-victim approach raises images of the confusing, distorted, circular arguments presented by Richard J. Herrnstein and Charles Murray in *The Bell Curve* (1994). It leads Weissberg to the false conclusion that political empowerment cannot significantly alter the policymaking influence of the black community, or the effective power position of citizens living in disadvantaged communities across the United States.

False Alarm: Why the Greatest Threat to Social Security and Medicare is the Campaign to "Save" Them. By Joseph White. Baltimore: Johns Hopkins University Press, 2001. 320p. \$42.50.

James R. Simmons, University of Wisconsin-Oshkosh

Few public policy issues have drawn more popular attention, generated more media commentary, or produced more books than the national debate over the dark fate of Social Security and Medicare. In a new book, noted policy scholar Joseph White argues that the "entitlement crisis" and the future insolvency projected by so many experts, politicians, and opinion makers are myths that badly need exploding. White insists that although we should be very concerned about the viability of each of these two essential government programs, we should not be carried away by the hysteria amplified by radical reformers and saviors of every political coloration. Rather, we should attempt to formulate a clear-eyed analysis of the purposes and constraints of social insurance that will produce genuine programmatic solutions that do not radically weaken the nation's social safety net.

White's primary goal in the pages of False Alarm is an attack on the emerging conventional wisdom that Social Security and Medicare are both entitlement monsters whose spiraling "unaffordable" costs will soon drastically undermine the economy and imperil future generations. The author wants to show that there is no social insurance crisis of the magnitude described by critics. Furthermore, most of the widely heralded "solutions" can be justified neither by the savings and alleged benefits they are likely to generate nor by ill-conceived and exaggerated predictions of budgetary meltdown. Instead, he claims, we should address the financing challenge facing Medicare and Social Security with an

incrementalist approach that recognizes the value primacy of these massive programs and that takes small, informed steps to make the necessary adjustments in them.

The first part of False Alarm focuses on the rationale, benefits, and financing of these two programs. Its three chapters explain what Social Security and Medicare actually do in practice and attempt to explain both the significant stakes involved and the contradictory reaction of most Americans to insurance versus entitlement programs. The second part examines the various spending trends, sociodemographic factors, and political value judgments that created a friendly environment for the multiplication of all the myriad doomsday scenarios that show these two programs threatening the prospects of future generations. Next, in Chapters 8 through 10 of Part III, White reviews and rejects the major proposals for radical reform like privatization, health vouchers, means testing, eligibility requirements, and reductions in costof-living adjustments (COLAs). In the last two chapters in the book's final part, the author defends his own detailed "responsible reform" agenda and follows up with projections for the likely effects of these reforms.

White identifies Social Security and Medicare as two of the most important institutions of American life and, given demographic shifts, he expects them to be even more important in the future. Although he rejects what he sees as a conservative antientitlement hysteria, he also parts with liberal defenders of these programs since he favors substantial change in financing and benefits and does not believe that the current surpluses in the trust funds should be spent on new programs. Ŝerious concern, he asserts, is warranted despite the absence of a crisis, and sensible adjustments should be phased in now to ensure fairness and practical administration. The schedule for this incremental reform agenda should include protecting the surpluses, increasing payroll taxes, diversifying trust fund investment, experimenting with competition or vouchers within Medicare, and adding years in the workforce to age in eligibility requirements. If these and other policy measures are adopted, he projects a positive future scenario during which time voters and their representatives will have 50 years to determine just what kind of program they

This Century Foundation book is compelling in almost every way. The volume is well written and the author's core propositions are well argued. Although it is intended for a popular audience, it contains all the spending estimates, actuarial tables, projections, data analysis, and comparative policy discussion that should appeal to policy experts. White takes

on all challengers, and he does so with a clarity and simplicity that downplays the depth of his understanding of complex issues. While he demolishes the pundits' gloomy predictions of generational warfare, he is more than willing to adopt some of the more modest programmatic tools and is perceptive enough to question his own values, anticipations, and insights. Along the way, the author marshals a substantial body of evidence and develops a number of arguments that I have not heard or read about before. White even provides the reader with a popular website (www.socsec.org) that offers a wide array of additional information explaining the two programs and the ways to reform them.

Of course, not all readers will find this book equally valuable. Obviously, would-be saviors of Medicare and Social Security will find fault with the positions White takes, just as they will find his arguments difficult to refute. He has harsh words for the policy debate in the 2000 presidential election and the campaign planks of both candidates Al Gore and George W. Bush. The book will also disappoint anyone seeking long-term programmatic solvency guarantees or certainties about the nation's economic future. At the same time, the author devotes little space to any discussion of radical proposals like national health insurance or the former Clinton administration's panacea "managed competition." Nor does White discuss nonentitlement reform or address other ways in which the federal government's budget might be balanced without Congress's resorting to raids on the trust funds.

Unfortunately, False Alarm is unlikely to achieve its author's most ambitious goals. I suspect that despite its careful and persuasive analysis, the book will attain only a small mass readership and that it will have only a limited impact on the national policy debate in Washington, D.C. Prophets of pending disaster and radical-change advocates often make the best-seller lists, while the works by proponents of more limited adjustments in the status quo tend to languish on the shelves. President Bush is no friend to the book's primary message, and the president seems intent on pursuing the privatization proposals and tax cuts on which he campaigned. Some of the book's proposals, such as safeguarding the trust fund surpluses, have already been rejected through recent government action. Clearly, good sophisticated arguments and careful analysis do not ensure good national policy. If they did, much of the author's agenda would already be in place. So Joseph White may have to wait for the next national election, another administration, or even a severe threat to Social Security and Medicare before his book gains the audience it so thoroughly deserves.

## **Comparative Politics**

The Rise of "The Rest": Challenges to the West from Late-Industrializing Economies. By Alice H. Amsden. Oxford: Oxford University Press, 2001. 416p. \$35.00.

Richard F. Doner, Emory University

Alice Amsden is one of the founders of the "statist" or "revisionist" school of East Asian economic development. Her earlier book, Asia's Next Giant (1989), refuted claims that growth in South Korea and other Newly Industrialized Countries was simply a function of high investment rates and correct prices, based in turn on the small-government fundamentals of stable, private property rights, macroeconomic stability, and trade liberalization. Amsden, along with others, emphasized the benefits of sector-specific state interventions distinctly at odds with neoclassical prescriptions.

But Amsden's work was distinct in several ways: She highlighted reciprocity and discipline, in which the state provided a range of rewards, such as protection in the domestic market and low-interest loans, in exchange for successful performance in areas such as exports, R&D investment and new product introduction. She portrayed late development as a process of learning, often through large, diversified business groups, rather than of invention or innovation. And she paid special attention to the shop floor, where engineers and technicians were critical toward the acquisition of project execution and design capacities.

Amsden's new book, The Rise of "The Rest", builds on these and other themes to explain how a dozen countries—seven in Asia, four in Latin America, and one in the Middle East—"rose to the ranks of world-class competitors in

a wide range of mid-technology industries" (p. 1). The first third of the book describes superficial pre-World War II industrialization in the "rest" due to halting and haphazard implementation of the "three pronged investment necessary to compete in modern industries: in large-scale plants and up-to-date equipment, in technological capacities and management teams, and in distribution" (p. 98). Despite its weaknesses, this prewar manufacturing, even under foreign ownership, generated a new cadre of engineers and managers who, Amsden argues, proved critical to postwar growth, especially where foreign ownership was weakened by decolonization.

The book's second section explores the "rest's" postwar growth through the lens of what the author considers key components of developmental states: development banking; criteria for sectoral targeting (e.g., mature technologies, foreign exchange savings) and for continued state support (e.g., export performance, localization); selective protection; and "national firm leaders." This section also points to two factors-income equality and labor rates-to explain why South Korea and Taiwan excelled in building indigenous technological and managerial skills (about which more later). The last section of the book traces emergence of the rest into "independents" (Taiwan, Korea, as well as India and China) and "integrationists" (Argentina, Brazil, Chile, Mexico, and Turkey). The former are concerned with "getting institutions right and building skills"; the latter emphasize "getting prices right and buying skills" (p. 293). Amsden argues that despite the increasing pressure for global liberalization, there remain ample opportunities through which the independents can expand indigenous technical capacities. Taking advantage of these opportunities is critical; the challenge to the rest is not deindustrialization but denationalization.

The Rise of "The Rest" is thus one of the rare works on economic development that not only stresses technological learning but traces this process from the shop floor to the business group and to national policy incentives. Contesting the "accumulationist" view of East Asian success, Amsden confirms that while investment in physical and human capital has been necessary, the integrationists have demonstrated that such investments were insufficient. It is one thing for firms to accumulate sufficient capital to purchase machinery; it is quite another for them to learn about, risk operating, and master technologies new to the country (Richard R. Nelson and Howard Pack, "The Asian Miracle and Modern Growth Theory," Economic Journal 109 [July 1999]: 416-32). But if firms are the locus of productivity gains, they are not the sole source. Indeed, Amsden's emphasis on productivity and quality varying cross-nationally among firms in the same industry lends further support to an understanding of growth as a consequence of "entrepreneurship, innovation and learning, all encouraged by the policy regime" (Nelson and Pack, p. 418). Her account thus suggests the relevance for the developing world of national institutional frameworks, such as "production regimes" and "national innovation systems" based on varieties of capitalism in the industrialized market economies.

What are the origins of such national "policy regimes"? Amsden's answer lends support to the importance, indeed the benefits, of equality and broad coalitions. But she enriches this perspective by suggesting specific causal mechanisms: Relative income equality allowed Korea to implement the "antiegalitarian" strategy of promoting large, diversified business groups. And the acceptance of generally rising labor costs prompted both Korea and Taiwan to "start building institutions and raising finance for R&D" due to fear that they would be priced out of global markets for unskilled products, even as foreign firms refused to sell them advanced technology (p. 245).

One weakness of the book is its tendency to force all the countries of the rest into an uncomfortable institutional mold. Amsden argues that "roughly from the 1950s through the mid-1980s, all countries in 'the rest' shared to an extraordinary degree the same set of developmental institutions, defined by a reciprocal control mechanism" (p. 281). If by reciprocal control mechanism is meant a variety of state measures to promote exports, structural change, and local value added through industrial investment, then the argument holds. But Amsden's view of reciprocal control implies state capacity to provide support in exchange for measures of "upgrading" technological improvement and market performance (e.g., product quality specifications). Despite impressive policy statements and intentions, such mechanisms were simply not in operation in several of the rest, including Thailand, whose Board of Investment Amsden praises for its "daring-cum-bureaucratism" (p. 28).

A related problem is the book's tendency to infer institutional capacities from outcomes. It is true, for example, that Indonesian plywood exports grew significantly in part under state pressure. But to infer that such pressure reflected reciprocal control mechanisms and state monitoring capacities while passing off allegations of corruption as economists' criticism (p. 176) misses an important part of the story. It also neglects an opportunity to integrate corruption and other political factors into the analysis. The more successful of the rest did not wipe out corruption; they instead limited, managed, and/or hived it off in ways that supported key political coalitions while not interfering with performance in key sectors (e.g., David C. Kang, "Bad Loans to Good Friends: Money Politics and the Developmental State in South Korea," *International Organization* 56, no. 1 [Winter 2002]: 177–207).

The problem of inferring state institutional and political capacities from economic outcomes reflects evidentiary weakness. Amsden's account would have been strengthened significantly by going beyond correlations between government programs and industry performance to include structured analyses of links between policy and investment decisions. Such accounts are also important in order to provide a clearer picture of state capacities: The successful cases would presumably involve public-private sector interactions that provided the mechanism for information exchange, program design, policy credibility, client "buy-in," and feedback. Otherwise, we are left with an implausible story, even in South Korea and Taiwan, of state officials as all-knowing directors, as opposed to highly motivated and politically sensitive learners.

Specifying causal mechanisms would help to address the charge that statist writings have been apolitical. It would encourage scholars to explore the sources of state preferences, such as interelite conflicts, resource endowments, and external security threats. It would also encourage us to specify the institutional mechanisms—including political arrangements—through which those preferences were expressed (e.g., Gregory W. Noble, Collective Action in East Asia: How Ruling Parties Shape Industrial Policy, 1998).

Amsden has made a powerful historical and cross-national case for the developmental importance of "getting institutions right and building skills." She has shown the costs and benefits of diverse models of capitalism within specific global contexts. Exploring the politics of growth in the "rest" will help us to assess the applicability of the rest's experiences to other developing countries. This is especially important in light of the danger that local institutional innovations—of the sort so effectively highlighted by Amsden—are being discouraged by globalization pressures.

Border Games: Policing the U.S.-Mexico Divide. By Peter Andreas. Ithaca, NY: Cornell University Press, 2000. 176p. \$39.95 cloth, \$15.95 paper.

Frank O. Mora, Rhodes College

The difficulty of policing a complex border like that between the United States and Mexico, specifically stemming the flow of illegal drugs and immigration, demonstrates, according to Peter Andreas's insightful and pathbreaking analysis, the challenges associated with globalization, diminished sovereignty, and economic integration between developed and developing economies. In fact, as he notes, intensifying law enforcement on the U.S.-Mexico border has had several unintended consequences, including enhancing the incentive and thus the flow of illegal drugs and migrants, which, in turn, create obstacles to the expansion of legal flows. Throughout the book an implicit question emerges: How do you balance the positive gains from globalization with the negative or dark side effects of free trade, that is, drug trafficking and illegal immigration? Taking the dilemma further, how can states in a global, borderless economy promote two contradictory policies simultaneously: strong prohibitionist, law-enforcement policies to enforce state sovereignty and economic neoliberalism and integration?

Andreas's political economy approach to examining state responses to the illicit consequences of globalization is an attempt to explain the sharp escalation of border policing on the U.S.-Mexico border at a time when both states, particularly since the early 1990s, have been encouraging and expanding cross-border economic flows. According to the author, "increased policing can simply be understood as a natural policy response to an increase in illegal cross-border flows and a corresponding increase in public pressure on the state to secure its borders" (p. 7). This is referred to as the reconfiguration and reinforcing of the border. The challenge is that as long as economic integration remains central to the global economy and economic growth and prosperity, the commitment to policing the border and regaining "control" is largely ceremonial, "not only a means to an end but an end in itself" (p. 11). This is the book's most revealing argument concerning the complex and tense relationship between globalization and politics.

The literature on globalization is extensive and rigorous, though often redundant. However, Andreas's research raises a number of new and critical theoretical and policy questions that focus on the illicit effects and concomitant state responses to integration and its natural consequence diminished sovereignty. The general public and policymakers in the United States have reacted forcefully to the problem of sovereignty by augmenting law enforcement at the border; the author suggests that such a response is counterproductive and shortsighted. Escalation of law enforcement and the emphasis on supply-side counternarcotics and immigration policies have the unintended consequence of increasing the risk and profit of illicit trafficking. This creates an image of an uncontrolled border, which, in turn, leads to greater demand for more law enforcement. As a result, border policing "has ultimately been less about achieving the stated instrumental goal of deterring illegal border crossers and more about politically crafting the image of the border and symbolically reaffirming the state's territorial authority" (p. 85). Therefore, failed state policies are directed not at resolving the problem but at projecting an image of control and success to justify the existence of federal bureaucracies and increased budgets.

Andreas utilizes the metaphor of a "game" to explain why the state pursues policies that focus on the "perforative and audience-directed nature" of the sport and not on what makes for good, effective border management (p. viii). Border Games implicitly indicates that in the tension between restructured state-market relations, it is the market, legal and illegal, which triumphs. The state simply lacks the capacity and willingness to patrol the border so long as globalization intensifies and the objective of economic neoliberalism and free trade remains the desired aim.

The author's response to this paradox and the challenge of diminished sovereignty is to emphasize the need for enhanced levels of bilateral and regional cooperation. Border Games incorporates the comparative case of the European Union to show how by escalating law enforcement through a multilateral process of "pooling sovereignty," it can control drug trafficking and illegal immigration without negatively affecting the goal of integrating Western Europe. The author refers to the multilateral framework of the Schengan Accords, an intergovernmental agreement to police external borders, as an example of a mechanism that could help alleviate the challenges on the U.S.-Mexico border. However, according to the evidence provided, the accord and other measures have not necessarily addressed the challenge of illegal trafficking at the border, but, in fact, have only "enabled German policymakers to pacify conflicting audiences" (p. 123). Thus, it seems that the Europeans are better at the game of symbolism, while being nearly as incapable as the United States at stemming illegal cross-border flows.

This is where Andreas's line of thinking gets a bit puzzling. What exactly is effective policing of a border, if a more multilateral approach does not necessarily stem illegal flows? Are the Europeans just better at playing the symbolic game by using a regional approach to legitimize ineffectiveness? If the border challenge is more ideological-political than physical, as the author indicates, then the border is certainly irrelevant, and any attempt at controlling for the negative side of globalization is impossible. Are there real strategies to reaffirming physical control, or is illegal activity simply a reality of globalization that states must accept? *Border Games* does not give a satisfactory answer to these questions, other than to emphasize image as central to the state's reassertion of control.

Andreas's insightful and rigorous study is an important contribution to the literature on globalization and transnational illicit trade. Beyond describing the challenge of policing one of the busiest borders in the world, he alludes to the difficulty and consequences of managing the integration of developed and developing economies. The author leaves much room for further research on this issue, which promises to be increasingly important as the United States and the European Union expand integration with developing countries.

The East European Gypsies: Regime Change, Marginality, and Ethnopolitics. By Zoltan Barany. Cambridge: Cambridge University Press, 2001. 384p. \$70.00 cloth, \$25.00 paper.

Ladis K. D. Kristof, Portland State University

Whoever has spent some time in the Indian state of Panjab and is to some extent acquainted with the East European Gypsies must have concluded that this was their original home. But as in Europe, so also in Panjab, even at the local Chandigarh University where an international conference debated the problem, little is known and understood about Gypsy ethnopolitics or ethnoculture. European interest in the Gypsies at the university level goes back at least to the middle

of the nineteenth century, but it focused on regional languages and folklore as, for instance, can be seen in the correspondence between Bogdan P. Hasdeu (Ghijdeu), a Romanian academic, and Franz Miklosich, an Austrian philologist.

The volume under review is the first ever to approach the Gypsy problem from a comparative sociopolitical and socioeconomic perspective based on systematic statistical inquiries and interviews in each of seven countries, Bulgaria, the Czech Republic, Hungary, Macedonia, Poland, Romania, and Slovakia. Regrettably, the situation of the Roma in Serbia is only occasionally mentioned, although for comparative studies it is an especially interesting case.

This study begins with a brief coverage of the historical impact of the disintegration of the Ottoman and Austro-Hungarian Empires, followed by an in-depth discussion of the social and economic consequences for the Gypsies of the collapse of the Soviet communist regimes, under which the Gypsies were regimented (like the rest of the society) and deprived of the possibility of practicing their own traditional social and cultural way of life, but, in exchange, assured of some minimum social and economic survival and, to some extent, protected from social hostility. Now they were left floating and exposed to the aggression of the rising wave of nationalism throughout Eastern Europe. The latter impacted Western Europe by causing a relatively large migration/escape of Eastern Gypsies to the West. Demographically, this migration was not too important, but politically, it rebounded forcefully on Eastern Europe through a mobilization of critical Western public opinion and the intervention of international political bodies in defense of Gypsy interests, especially their rights guaranteed by international law.

Briefly, their rights qua citizens of their home countries, above all, equality before the law, began for the first time ever to gain some meaning, largely because the several Eastern countries hoped in their turn to become equal members of the European Union. Of course, equality before the law does not necessarily guarantee the elimination of all marginality in practice (a problem emphasized by Zoltan Barany). Within the expanded European Union, both the new member states and the Gypsies are going to remain for a time marginal until, on the one hand, acceptance of sociopolitical diversity and economic practice is broadened and, on the other, the individual differences of life quality are to some extent reduced. These differences exist everywhere on the individual country level, but to varying degrees. Romania, for instance, obviously has by far the largest Gypsy minority-perhaps under one million, or perhaps three millions, possibly even four millions and growing fast (depending on who "counts")but given the rather laissez-faire nature of Romanians, the weight of numbers was not very important as long so one did not attach specific rights (benefits) to specific numbers (percentages). Growing nationalism notwithstanding, it is to this day quite acceptable in conversation to describe a neighbor as "Gypsy-like," which presumes some Gypsy ancestry, or physical appearance, but does not negate his Romanianness. In Poland, it would be impossible to make such a wishywashy identification. You are either a Pole or a Gypsy, and specifically a Polish Gypsy, not one of those "dirty" Romanian Gypsy immigrants.

Incidentally, the question of national identity of Gypsies is often closely tied to their (assumed) religious identity, and it is regrettable that the author devoted so little attention to this problem. In Poland, to be Polish you practically have to be a Catholic and show it on various prescribed occasions. In the Orthodox countries, where religious observance is often much more casual, the Gypsies can easily be in and out of the church without much commitment or attracting much attention, even when it comes to baptizing their children. Their

participation is much more frequent, and often specifically invited, in various funeral and cemetery traditions that possibly have pagan roots; these are occasions when free food and some coins are distributed, thus adding to their attraction.

New and very important is Barany's extensive coverage of Gypsy leadership on the national level in the several countries, as well as on the international level. Some of this leadership is traditional in the sense that who gets rich becomes automatically an admired member of the community, able to dispense various favors and consequently influential and automatically a spokesman for the community, though not necessarily genuinely concerned about, or understanding, its genuine long-term interests. Far less common, indeed very rare, are those who are university educated, have not lost contact with their family and ethnic roots, and are able to converse on an equal level with representatives of international organizations and top members of national governments. Often, all too often, the very fact that they are educated, think differently, and especially lead a different life style alienates them from the community for which they should and could be valuable spokespersons. This is frequently the problem when it comes to electing members of parliaments or representatives to international bodies. Barany cites many examples of violent clashes between simple local leaders and higherlevel representatives, who are accused of being interested, for instance, in imposing some artificial uniform language on all Gypsies, as well as various goals and values that have nothing to do with the genuine problems of the Gypsy population, which struggles with only one fundamental issue, simple

To sum up, Barany offers us a pioneering comparative study on a subject of considerable importance to students of Eastern Europe and of relevance to all who labor in the field of comparative politics where regime change, marginality, and ethnopolitics come to the fore.

Constitutions in a Nonconstitutional World: Arab Basic Laws and the Prospects for Accountable Government. By Nathan J. Brown. Albany: State University of New York Press, 2002. 244p. \$65.50 cloth, \$22.95 paper.

As'ad AbuKhalil, California State University, Stanislaus

This work is by a serious scholar who had previously written a fine book on peasant politics in Egypt. Interest in constitutionalism in the Arab world may be dismissed as naive given the notorious reputation of the region for autocracy and dictatorships. Yet Nathan Brown insists on taking constitutional developments in the region seriously, and he meticulously covers most constitutional developments over the span of the last century. But the book could have been easily condensed into a scholarly article. In the first part of the book, for example, which stretches into page 94, he provides the reader with a blow-by-blow account of constitutional developments in select Middle East countries. It contains very few insights, and the author breaks no new grounds; the developments were previously covered in many other works (for example, Elie Kedourie, *Politics in the Middle East*, 1992).

The author also fails to persuade the reader as to why it is important to study constitutional developments and legislative bodies when he acknowledges that they constitute "a weak force in Arab politics to date" (p. 93), and when he stresses that Arab parliaments are left emasculated (p. 196) by a variety of absolutist and unaccountable leaders. This is not to dismiss the study of constitutionalism altogether, and Brown was right in pointing out the validity of the method (pp. 198–99). But this is where the book fails. He raises many important questions regarding the causes behind

constitutionalism and the actual roles of parliaments, but he does not draw the useful links and contexts in which constitutions are drafted and parliaments are created. What we are left with is an anthology of detailed constitutional references and citations that seem to be offered in a political vacuum.

There are few references, if any, to regional or international developments and their impact on Arab constitutional politics. For example, the state of war with Israel has allowed several Arab governments to suspend constitutional and parliamentary life all in the name of the battle for Palestine. Furthermore, the author makes no references to Arab public opinion and Arab popular aspirations. In fact, the Arab people are missing from a book dealing with political life and struggles, as if the public does not make demands on governments even when those governments are not necessarily responsive or accountable.

In addition, if the validity of the study of constitutions is even questionable in Western democracy where actual politics often deviate from constitutional designs, it is even more questionable when constitutions descend from above often for purposes of political legitimation (a concept that should have been pursued by Brown). In fact, the creation of constitutions and bodies of ostensible political representation serves as a measure of regimes' estimation of popular opinions and aspirations. Regimes often respond to popular demands for political openness and liberalization by creating the facade of an accountable political system. Of course, the Arab peoples are not naive and often realize the emptiness of governmental gestures, which explains the limited political legitimacy that is possessed by most Arab governments.

One may also strongly disagree with Brown's contention that Arab constitutions are "rarely blatantly violated" (p. 7). It is easy to document, and human rights organizations have done just that, the extent to which Arab constitutions and political promises are routinely and blatantly violated. The Iraqi constitution, for example, states in Article 2 that "the people are the source of authority and its legitimacy," while Article 19 guarantees the equality of all before the law. And the Libyan constitution states in Article 10 that "the creation of honorary titles and civilian ranks is prohibited," while Article 25 of the Syrian constitution maintains that "freedom is a sacred right. The state protects the personal freedom of the citizens and safeguards their dignity and security." Obviously, the citizens of those countries would dismiss Brown's contention in this regard. Constitutions are only adhered to insofar as they provide political rationalizations and justifications for actions and policies of the government, and they also provide an ideological sourcebook for the political legitimacy of regimes.

In talking about the Egyptian constitutional council of the nineteenth century, Brown states that "democracy was hardly an issue: the Council, though elected, was essentially a way to ensure representation primarily of the provincial notability" (p. 29). This is certainly not unique to Egypt, and may in fact apply to the founders of the U.S. Constitution. But it is customary to attribute lofty ideals and motives to founders of Western democratic institutions, while Easterners are seen as always devoid of principles and ideals besides self-interest. He also observes that independence "occasioned the writing of a constitution" (p. 61), again as if this is unique to the Arab world. His disregard of regional and international factors is most evident when he refers to the Syrian military coup of Husni Az-Za'im that ended civilian rule (p. 69) without informing the reader that it was engineered by the CIA, as we now know. The choice of the case studies is often curious: The author includes Iran (a non-Arab country), while he largely ignores Lebanon, which has had the most effective and independent parliament in the entire Arab world. It was only in Lebanon where a government was voted out of office altogether and where the top post of government is open to contestation.

The second part of the book is more analytical and interesting, although some redundancies occur. The author is most knowledgeable about Egypt, and he offers interesting remarks about the role of the judiciary in Eygptian political life. But the weakest section of the book deals with Islamic constitutionalism where he traces constitutional evolution to the nineteenth century without even a passing reference to ideas of governance in Islamic political thought. The author should have considered the limitations set on political authority in Islamic political treaties (see p. 178). Further, many political thinkers sanction the overthrow of a tyrannical ruler. Islamic philosophers also justify the necessity of governance on rational grounds, and not merely on grounds of prophetic revelation as the theologians have done.

In sum, the book is a disappointment and fails to provide its own raison d'être.

Reinventing Khomeini: The Struggle for Reform in Iran. By Daniel Brumberg. Chicago: University of Chicago Press, 2001. 306p. \$55.00 cloth, \$21.00 paper.

Mehrzad Boroujerdi, Syracuse University

This is a book about a man who may be considered "the twentieth century's last example of a 'pure' charismatic leader" (p. 5). With these words, Daniel Brumberg begins to analyze the thoughts and legacy of Ayatollah Ruhollah Khomeini (1902–89), who came to power in Iran in February 1979. In his introduction, the author maintains that his study provides "an accurate, objective, yet sociologically empathetic evaluation of the very complex process of ideological change in the Islamic Republic of Iran" (p. 8).

By examining a wide variety of cultural, political, psychological, and social forces operating within the Iranian political milieu, Brumberg offers an insightful account of the multifaceted nature of revolutionary charisma. Dissatisfied with both the symbolic and instrumentalist theories of charismatic rule, he maintains that "the images of authority that political actors bring to social and political conflicts are not mere rationalizations of material interests; nor are they reflections of some cultural essence" (p. 6). To capture the complex nuances and the chaotic and nonlinear traits of competing authority systems, the author adopts a historical institutionalist perspective heavily supplemented by insights from the literature on political culture.

Brumberg introduces four analytical concepts to capture the nuances of charismatic authority in Iran: multiple biographies, multiple shared imaginations, dissonant institutionalization, and complex routinization. "Multiple biographies" denotes a leader's absorption of contending concepts of authority, while "multiple shared imaginations" refers to the existence of an assortment of political visions in a given society. "Dissonant institutionalization" is the dynamic process whereby contending visions of political authority are reproduced within various state and social institutions, as well as in the political lexicon of the ruling elite. Finally, "complex routinization" applies to the prolonged, chaotic, and indeterminate process through which political struggles either obstruct or advance the transformation of revolutionary organizations and ideology.

Brumberg considers dissonant institutionalization the "defining feature of the Islamic Republic" (p. 35), and asserts that thanks to its nature and effect, the system of contending authorities in Iran will endure for the foreseeable future (p. 246). The author also regards the "most enduring trait" of Iran's revolution as the "twin valorization of a zealous

quest for utopia alongside the pragmatic struggle for political order" (p. 13).

According to Brumberg, Khomeini was the embodiment par excellence of this twin valorization. Here was a magnetic leader capable of combining charismatic, traditional, and utilitarian visions of political authority (p. 80), yet one who did not have a coherent, consistent, or straightforward blueprint for revolutionary action (p. ix); a man with a stoic character who believed in the vanguard theory of revolution (p. 89), yet was concerned about the paradoxical consequences of clerical rule (p. 117); a cleric whose versatile understanding of Islam "was conditioned by notions of power, expediency, and interest" (p. 84), yet whose predilection for Islamic mysticism would often lead to contradictory pronouncements and an erratic praxis.

While Reinventing Khomeini is a thought-provoking account of modern Iran's political development, it is not without its shortcomings. This reviewer believes that Brumberg's penchant for the charismatic theory of political authority and psychological explanations leads him to overemphasize the significance of Khomeini's personal deprivations of youth (losing both parents) and to exaggerate the extent and weight of his charismatic prowess. Did he really manage to exude mystical charisma as early as the 1930s when he was just entering the third decade of his own life? Is it not true that in the 1930s, 1940s, and 1950s, he had to live in the shadow of more prominent religious leaders of the time, such as Ayatollah Ha'eri-Yazdi, Ayatollah Kashani, and Ayatollah Borujerdi? If we were to discount the hero worship style of historiography prevalent in the postrevolutionary era, we would have to answer the former question negatively and the latter affirmatively. Sure enough, Khomeini was respected within the confine of religious seminaries for being a learned teacher, virtuous cleric, and courageous man, yet the fact remains that he was not the highest religious authority in the 1930s, 1940s, or 1950s, nor is there much evidence that he enjoyed a great deal of mass following during these decades.

In this regard, some of Brumberg's omissions are rather troubling. For example, he maintains that Ayatollah Khomeini became more political in his outlook during the 1940s and 1950s. However, the author does not provide any explanation as to why this charismatic cleric was conspicuously absent from politics during the tumultuous events of 1951–53 when the Iranian attempt to nationalize oil was rewarded with a CIA-inspired coup. Should one hypothesize that this is a deliberate omission since its acknowledgment could have cast a shadow of doubt over the author's narrative?

Furthermore, Brumberg ends his book with a rather controversial—and in my view erroneous—conclusion. He maintains that Iranians have a deeply imbedded and intrinsic attraction to charismatic leaders, and that modernity in Iran needs to be accommodated to the quest for a spiritual life (p. 247). As proof, he refers to how Iranian "leaders," regardless of their position on the political spectrum, do not wish to let go of Khomeini's legacy. Does the latter argument, however, solidly support the former? Why should the incessant opportunistic appropriations and perennial bickering about Khomeini's legacy among the "political elite" be interpreted as a sign of the whole society's penchant for charismatic leaders or spiritual life? Have not the existing criticisms of the political elite literature convinced us to avoid equating without question the preferences of the ruling elite with that of the masses? Are not the widening rifts within the clerical establishment, criticisms of the cult of personality, the rampant debates about democracy and civil society, and so on—all of which Brumberg himself refers to in the closing chapters of his book—enough evidence that Iranian society is moving toward greater democracy, modernity, and secularization? Moreover, if we were to accept that Iranians do have an intrinsic attraction to charismatic leaders and spiritual life, does not that somehow contradict—or at least diminish the centrality Brumberg had earlier assigned to dissonant institutionalization as the defining feature of political life in contemporary Iran?

Finally, mention should be made of the fact that the scarcity of primary sources used in the book and the absence of a bibliography, coupled with typographical errors—I counted some 20 examples—have somewhat blemished the value of a book that offers much food for thought. Despite these shortcomings, *Reinventing Khomeini* is a rewarding read for students of Third World ideologies in general and those interested in political Islam in particular.

Tearing the Social Fabric: Neoliberalism, Deindustrialization and the Crisis of Governance in Zimbabwe. By Padraig Carmody. Westport, CT: Greenwood Publishing Group, 2001. 240p. \$67.95.

African Economies and the Politics of Permanent Crisis, 1979–1999. By Nicolas Van De Walle. Cambridge: Cambridge University Press, 2001. 304p. \$59.95 cloth, \$19.95, paper.

Michael F. Lofchie, UCLA

Sub-Saharan Africa continues to underperform the world's developing regions, remaining a region of pronounced economic stagnation at correspondingly frightful human and social costs. Exactly why this is so has been the subject of extensive debate both among academics and within the policy community. Since most sub-Saharan African countries have been implementing neoliberal economic reforms, there has been particularly heated discussion about whether or not these policies have helped to improve the economic environment.

Much of the literature on this topic has been ideological. There is a highly visible left-right spectrum that divides those who favor market-friendly economic reforms from those who oppose them. The former believe that, at the very worst, structural adjustment has helped arrest and even turn around a process of precipitous economic decline. Advocates of this view argue that even 2% economic growth is a dramatic improvement over -3%. On the other side are those who see liberal economic reforms as worsening an already bad situation. Those on this side of the ideological divide believe that neoliberal economic measures have contributed to deindustrialization and, thereby, worsened the continent's pandemic political and social crises.

It is unlikely that either of the two groups will be able to persuade the other, but of the two books reviewed here, Nicolas Van De Walle's deserves to be read by all scholars interested in serious discussion of the issue. For although his work could be roughly categorized as center-right in its orientation, that is, pro-reform, African Economies and the Politics of Permanent Crisis shows a careful scholar's painstaking and thoughtful reflection about all sides of this issue, including the deeply perplexing question of why liberal economic measures have fallen so far short of early hopes and expectations. Padraig Carmody's book on Zimbabwe occupies the ideological left, making a straightforward argument that Zimbabwe's efforts at neoliberal reform are the root cause of its economic woes, including deindustrialization and a badly torn social fabric. The viewpoint is not original, nor will his presentation of it appeal to those who would seek a more nuanced treatment.

Africa can test the mettle of even the most resolute social scientists, for the region's socioeconomic data is fundamentally untrustworthy, woefully incomplete, and frequently contradictory. Even such seemingly basic questions as whether countries that have undertaken to liberalize their economies have enjoyed higher growth rates than those that have not seem to defy empirical resolution. Nevertheless, some scholars exhibit the patience to sort through the truly encyclopedic literature on economic performance, hoping to tease out a plausible understanding of the elusive connection between policy reform and economic growth. Van De Walle's work has this merit and provides a useful road map of a jumbled and bewildering economic world.

By contrast, Carmody's book on Zimbabwe fills in an alltoo-familiar template and will largely satisfy only those who have already decided that market-based economic reforms and the institutions that advocate them are at the root of Africa's economic woes. His core argument is that the liberal economic reforms urged on Zimbabwe by the International Lending Institutions (ILIs) have caused a collapse of the country's textile, clothing, and footwear industries. Carmody does not consider the obvious alternative viewpoint. Proponents of economic reform might welcome the collapse of industries that "developed" in the first place only because they were sheltered within a cocoon of protectionism, and that survived only on the basis of costly subsidies that represented a major drain on scarce economic resources. In this alternate perspective, the deindustrialization of loss-producing enterprises is best viewed as a necessary first step toward setting the stage for a more sustainable pattern of industrial

African Economies is more impressive on several criteria. First, it presents a painstaking and highly accessible review of much of the political economy literature on Africa. It is also valuable for its willingness to extract a measure of explanatory merit from various analytic positions. Several of the authors Van De Walle cites will be pleased to find their views strengthened by the clarity with which he restates them. By avoiding the sort of simple "blame the markets" approach that pervades Carmody's work, Van De Walle also convinces us that Africa's problem is infinitely complex and therefore not amenable to any single-factor interpretation. His basic conclusion—that the principal fault lies in the nature of the African political process—is neither startling nor surprising. But the care, detail, and sensitivity to others' research with which he develops this position provide more than sufficient reason that his book should be read in its own right as an important contribution to our understanding of Africa's economic plight.

Van De Walle acknowledges that market-friendly economic reforms have largely failed Africa, but he sees the reason for this in the underlying character of the African political process. African political systems are based on neopatrimonial forms of authority that provide corrupt political leaders with the strategic flexibility to evade the reform process or manipulate it to political advantage. Briefly, neopatrimonial forms of authority are highly personal and almost always feudal in nature, and thinly but only partially veiled within a burka of modernity. He argues that neopatrimonial governments cause economic failure because they subvert economic resources to the private and wasteful use of political leaders whose overriding goal is the maintenance of political power. Such governments are also highly prone to rapidly metastasizing corruption: Public expenditures in particular are calculated on the basis of their contribution to the maintenance of power, rather than the opportunity to address real social needs.

The epicenter of the neo-patrimonial idea is that modern institutional arrangements, such as functionally organized bureaucracies and formally representative patterns of authority, are merely outward trappings that disguise a very different inner reality. That reality consists of all pervasive dyadic (patron-client) relationships that subvert the purpose of the public realm by permitting its most powerful figures to appropriate public and private resources for their personal use. This essential idea has appeared in a number of different forms, including, for example, Richard Joseph's (Democracy and Prebendal Politics in Nigeria: The Rise and Fall of the Second Republic, 1987) classic use of the term "prebendal" to describe the way in which Nigerian political leaders systematically pillaged the public treasury to maintain themselves in positions of power and wealth.

The secret to longevity of neopatrimonial systems is their remarkable flexibility. Neopatrimonial forms of authority have adapted themselves readily to the parliamentary institutions imposed by departing colonial powers, to pressures for structural economic change from the international lending institutions, to more recent pressures for democratization by the bilateral donor community, and even to pressures for a more participatory political environment by Africa's renascent civil society. Van De Walle's analysis is particularly illuminating when he shows how well the neopatrimonial political format has lent itself to the prebendal use of foreign public assistance. Joel Barkan once observed that certain of Africa's political leaders have become singularly adept at aiming for a C+ on the donors' democracy scale: just enough democratization to satisfy donor conditions for economic assistance, not enough to loosen their real hold on political power. Much the same could be said of the way Africa's neopatrimonial governments handle foreign economic assistance. The operative strategy is to accept just enough liberalization to satisfy the permissive scrutiny of multi- and bilateral organizations that wish to avoid political confrontation, while avoiding farreaching changes that would jeopardize the patron-client networks that support corrupt regimes in power. By adroit maneuvering, neopatrimonial governments subvert the intended purposes of foreign economic resources, squandering donor wealth on projects that are politically intentioned, not developmental.

This analysis is subject to one criticism. The exact connection between neopatrimonial authority and poor economic performance is underexplained. For in the last analysis, the notion of neopatrimonial authority has only limited utility. Its primary validity is descriptive, not explanatory. What the concept of neopatrimonialism provides is a highly generalized, broad-brush portrait of the nature of political authority throughout much of modern Africa. Who could deny Africa's seemingly all-pervasive reality of patron-client ties, corrosive corruption, and power-driven politics? Or that the realworld power structures of African regimes have only the most fleeting connection with its formal institutional framework of modern bureaucracy and representative structures?

As an explanatory idea, however, neopatrimonial authority has certain weaknesses. It cannot, for example, explain differences over time in economic performance within countries, nor can it explain the rather striking variance in economic performance across countries. This results in an argument that, while outwardly compelling, does not sustain close inspection. Van De Walle is convinced of the following logic. Neopatrimonial authority is ubiquitous in Africa. So is poor economic performance. Therefore, the former causes the latter. To make this argument stick, however, he would need to go much further and address a host of presently unanswered questions. Are there governments in Africa that exhibit other forms of authority? If so, how have these performed? If, on the other hand, all of Africa's governments are neopatrimonial, then how can we explain why they vary so greatly in economic performance?

Some examples may help illustrate this weakness. During the 1960s and 1970s, Ivory Coast and Kenya were sometimes referred to as Africa's economic "miracles" to describe their highly positive growth performance. During the 1980s and 1990s, however, both economies began to stagnate. Did both suddenly become more neopatrimonial? If so, how and why? If not, what was their form of authority while their economies were performing well? Similarly, during the 1980s and 1990s, Ghana and Tanzania began to perform measurably better than they had during the previous two decades. Did they become less neopatrimonial?

The challenging intellectual task is not to establish the presence of neopatrimonialism throughout Africa. Elements of this political pattern can undoubtedly be found everywhere, including this country. The more challenging project is to explain why African countries vary so greatly in how well they do, both over time and in contrast to one another. Is there room for differing developmental subcategories within the neopatrimonial rubric?

There is great awkwardness in raising these issues. For elsewhere in his work, Van De Walle has been an intellectual leader among the tiny number of Africanist political scientists seeking to bring rigorous quantitative methods into this field. African Economies might have benefited from that approach. Even so, the book is well worth reading because of its sensitive and thoughtful effort to wrestle with dauntingly difficult questions. For those who would venture into this literature, Van de De Walle's road map provides a useful guide through a particularly conflicted literary domain. Like the very best road maps, it is especially valuable at the beginning of the journey. Less so at the end, where unanswered questions remain.

The Breakdown of Class Politics: A Debate on Post-Industrial Stratification. Edited by Terry Nichols Clark and Seymour Martin Lipset. Baltimore: Johns Hopkins University Press, 2001. 352 p. \$18.95.

Jytte Klausen, Brandeis University

This book is a collection of essays from a 1996 conference that brought together a number of political sociologists to discuss an article from 1991 by the coorganizers, Terry Nichols Clark and Seymour Martin Lipset, originally published in International Sociology. They argued that the collapse of blue-collar industries and other changes in occupational and income structures associated with postindustrial social stratification had lead to a breakdown of class politics. Two years later, the journal published a rebuttal by Mike Hout, Clem Brooks, and Jeff Manza that class conflict remained important but that the political parties ignored it. The two articles and a 1993 response by Clark and Lipset are republished here together with a series of response papers written for the 1996 conference. Hout et al. criticized Clark and Lipset for failing to distinguish between class as a social phenomenon and the political representation of class. "Class interests may remain latent in the political arena," they wrote, "but this does not mean that they do not exist" (p. 64).

The debate over the breakdown of class politics is mostly about theory and interpretation, as nobody disputes the facts. Paul Nieuwbeerta clears the ground by addressing a controversy over the most commonly used measurement of class voting, the Alford Index, which has been criticized for being too sensitive to shifts in occupational structure. Comparing different measurements, Nieuwbeerta finds that all show an increase in class cohesion in voting patterns in 20 advanced industrial countries from 1945 to the 1960s, a beginning decline in the 1970s, and ubiquitous decline in the 1980s.

Responding to Hout et al., Clark, Lipset, and Michael Rempel elaborate their "decline" thesis. Class still exists, they agree, but the experience of class is less rigid and stratification patterns have changed. Using the Alford Index, they show that class voting fell to below 20 index points in the 1980s in Great Britain, Germany, and France, reaching a level of (lacking) articulation of class comparable to that of the United States. (Although class cohesion also declined in Sweden, it did not drop as low.)

A more recent chapter by Lipset lists the "Third Way" electoral victories—from Britain's Tony Blair to Germany's Gerhardt Schröder, New Zealand's David Lange to Australia's Bob Hawke, including even France's Lionel Jospin—as further evidence for the "decline of class politics" thesis. Lipset also points to the intuitive evidence that a numerically diminished working class has lost political clout, compared to that of the 1950s or the 1960s. Employment in nonmanual occupations has risen to nearly 60% and declined in manufacturing to about 16% in the United States. In other countries, a similar shift has taken place, even if manufacturing employment still stands at a slightly higher percentage of all employment.

John H. Goldthorpe argues that both sides in the debate are "flogging a dead horse." The importance of class voting was exaggerated already in the 1960s by political sociologists, because the primacy-of-class thesis implied an incorrect dichotomy between attracting working-class voters and voters from other classes (p. 108). Goldthorpe's view is that there has been no consistent long-term change to the association between class and voting since class de-alignment was first pronounced in 1959, after the British Labour Party and the German Social Democrats "modernized" their party programs. The evidence for class de-alignment is scant, Goldthorpe claims, but it appears that a realignment is in process, with skilled workers moving to the right and lower levels of nonmanual voters moving left (p. 114). He concludes, somewhat mysteriously, that all we have is "trendless fluctuation." That is also David L. Weakliem's conclusion, although the data presented in the chapter show an unambiguous decline in the importance of class as a primary source of political attitudes among voters born before or after 1935 (p. 211).

Dick Houtman provides an interesting analysis of education as a source of social liberalism, and he contrasts it with social-economic exposure (without education) as a source of economic liberalism but social conservatism (p. 183). He does not elaborate on the importance of his findings for left politics, but it seems obvious that he has identified an important tradeoff faced by left parties, who risk offending working-class cultural conservatism when they embrace social liberalism.

Critics may be right that the decline thesis fails to provide an interpretative theory for the causal link between social stratification patterns and changes in party appeals, but from a practical point of view, how can one argue that the political salience of class has not diminished? Herman L. Boschken does so by arguing that public policy institutions are inherently biased in favor of the "upper middle class," a group that he curiously refers to as the "UMC genre," apparently unique to U.S. society, and "defined by modern and postmodern institutions" (p. 228). His hypothesis is that the more the UMC genre is represented in the target populations of an agency, the better the agency performs. He measures biaswhich he calls "outcome skewness" [sic]—by means of index measures based on performance data from 42 urban transit systems published by the U.S. Department of Transportation. He concludes that "an anonymous UMC matters in skewing outcomes," but also that he could not "more precisely infer the power of the upper middle class" (p. 243). The jargon and methodology fail to obscure a simplistic elite theory.

In the final chapter, Clark argues that we have a New Political Culture (NPC). He proposes (in algebra) that voting is a function of party programs, occupation, demographics, and political attitudes, but provides no estimates for the value of each variable in his equation. The evidence is drawn from content analysis of party program changes over several decades in some 30 countries. Clark and his collaborators found a near-simultaneous erasure of issues of particular interest to labor beginning in the early 1980s by both left- and rightwing parties. The chapter also draws upon another research project investigating municipal policy choices with respect to the trade-off between fiscal austerity and social services. The connection to the New Political Culture thesis is tenuous, particularly as austerity measures often aim to preserve social programs.

Ultimately, it is the lack of attention to some of the most obvious causes of Third Way politics that frustrates the reader. The Third Way politics of the 1990s aimed to encapsulate a new left coalition capable of holding onto power for extended periods, by bringing middle-class voters and women voters, along with an old but much transformed working-class constituency, together on a defense of the welfare state.

The "pink-collar" revolution was less about class than about gender, and to that extent the "class still matters" folks have a point. Female service-sector workers are still workers. The encapsulation of middle-class voters and women voters as part of the Third Way political bloc required policy initiatives and party reforms that sidelined blue-collar and manual labor. It is a pity that neither side debating in this book bridged the gap between sociology and party appeals by theorizing the connection among occupational change, interests and identities, and electoral strategies.

The titles of these books point both to their common concern and to the difference between them. Still Fighting underscores the extent to which Latin American women (in this case, Nicaraguans) are still struggling, from a disadvantaged position, to achieve recognition of their own personal value and identity, as well as a better social, political, and economic position. Empowering Women underscores, instead, the extent to which women's struggle is about achieving power in the form of legal title to land. The former stresses gender identity while the latter emphasizes personal empowerment. The first accentuates setbacks experienced and the work still to be done; the latter highlights accomplishments while acknowledging that much work remains. Carmen Diana Deere and Magdalena Leon locate their work within gender studies in Chapter 1, stating their orientation toward redistribution rather than recognition (p. 9). Although Katherine Isbester does not refer to gender studies, her work is about the struggle for identity and the role it plays in strengthening a social

Both volumes share a common theme: The outward political experience of a nation or region, either with regard to democratization, land reform, or titling, is not necessarily the experience of women within the situation. Where a nation has democratized, women have been included in democratic participation to a much lesser degree than men. Where land has

been redistributed, men have benefited far more than women. Where peasant landowners have received title, the majority of recipients are male. The extent to which both volumes illustrate the difference in gender stories underscores the degree to which studies of political reform need to attend to the difference in the way reforms affect the genders. Changes that look positive may only be positive for men. Accordingly, if the goal of reform is a more just society, close attention to the experience of women within revolution, democratization, and agrarian reform is in order. To assume that political progress has equally benefited all members of society is to ignore and perpetuate the extent to which positive changes may only have helped men.

Deere and Leon's book, *Empowering Women*, is an extensively researched volume on the land ownership rights of Latin American women. Reaching across the continent and over history, the book offers admirable scope and extensive detail on the changes in women's land ownership. It begins by examining this ownership in colonial times, and then describes changes throughout the nineteenth and twentieth centuries. Chapters include a review of land reform under the Alliance for Progress and with neoliberalism. Each chapter outlines the limits to reforms with regard to female land ownership.

The attention to detail and historic comparison reveal surprising findings. For example, the legal codification of property that came from Europe in the colonial period left women and women's property less protected in the New World nations that inherited English common law than they were in nations that inherited the Spanish legal system. Additionally, Chapters 7 and 8 illustrate that the indigeneous, pre-Spanish legal system accorded more protection to women's property rights than previously understood. In regions where indigenous land rights have affected property ownership, women are more likely to own land than they are where indigenous influences have been eliminated.

One irony of changes in land ownership laws is the outcome of neoliberal reforms. With its emphasis on individual liberty, neoliberalism has sometimes enhanced the economic position of women by increasing their land ownership to its highest level ever. As the book reaches the end of the twentieth century, it concludes that real progress has been made on the continent. Various reforms combined with revolutions and other pressures for change have made laws more gender neutral. Where these are enforced, women's property ownership has increased. Nonetheless, much work remains and the book concludes with a sense of urgency because land-titling programs are underway virtually everywhere in Latin America. Insofar as gender-neutral laws can be utilized, the legal and economic position of women will improve.

Regrettably, the book does not address the extent to which changes in property ownership have improved the life situation of Latin women. Deere and Leon say that such questions are beyond the scope of the volume. The omission, however, limits the inferences we can make about the relationship between property rights and women's empowerment. Similarly, the book's failure to place its findings within a sytematic theoretical framework, and the decision instead to concentrate on detailed legal history, constrains any generalizations about women's empowerment in other places and times. Such limitations, however, should not overshadow the book's great scholarly accomplishments. *Empowering Women* is a monumental study of the legal history of women's property rights in Latin America, with utility to legal scholars and historians, as well as to political scientists and women's studies.

In contrast to the Deere and Leon book, Isbester's Still Fighting is a detailed study of the women's movement in one

nation: Nicaragua. Grounding her work in the social movements literature, Isbester uses resource mobilization (RM) theory to consider both the accomplishments and the limitations of different movements and subgroups of women in Nicaragua over two decades. She considers women's position in the revolutionary insurrection, throughout the Sandinista years, and under the Chamorro regime. Where the women's movement or subsections of it succeeded, withered, or failed entirely, she shows how resource mobilization theory helps explain those outcomes.

Although Isbester never summarizes her theoretical position, the thrust of it eventually emerges. Ultimately she is dissatisfied with RM theory, stessing instead the contribution of identity theory in understanding social movements. Resource mobilization theory considers the material goods available to a social movement and explains success or failure within this materialist conception. Yet it fails to account for the perception of what a "good" actually is (p. 13), an evaluation that may well be related to participants' identities. For example, whereas oppression is often a disadvantage to a social movement, when combined with a struggle for identity that itself defies oppression, it can be an asset. This reality is captured by identity theory but not by RM theory. Isbester illustrates how an emphasis upon women's identity, including a demand that society recognize that identity in a positive way, enhances movement strength.

Isbester does scholarship on Nicaragua a great service in separating the "Sandinista story," essentially a male story, from the experience of women within the Sandinista revolution. A movement that was supposed to be liberating and reformist was more so for men than for women. Yet one wonders if the picture painted is too dark and the responsibility for limitations imbalanced. Progress on women's issues did emerge under Sandinismo, and Violeta Chamorro's traditionalism did soften during her government. If Isbester had placed Nicaragua in comparative context or examined the Aleman years, the difficulties she describes might appear relative. In Deere and Leon's continental study, Nicaragua is often one of the more progressive cases.

More importantly, however, and omitted from Isbester's account, is the responsibility of Nicaraguan women themselves for their predicament. Women provided majority support for Chamorro's election, while men tilted slightly toward Daniel Ortega. And women voted for both Arnoldo Aleman and Enrique Bolanos more strongly than did men. Isbester overlooks women's support for candidates antithetical to their interests. While she is correct that Sandinismo could have done and could do more, Nicaraguan women have supported governments that have done far less.

Although Isbester's consideration of the women's movement within social movement theory is one of the strongest aspects of her book, grounding her work in gender theory as well would have allowed her to recognize women's own responsibility. The role of the state and the limits of organization, both of which she addressed, are only part of the explanation for women's restricted progress in Nicaragua. The other part lies with the limits and contradictions of the women themselves and of their demands. Sonia Alvarez's distinction between "feminine" and "feminist" goals (Engendering Democracy in Brazil: Women's Movements in Transition Politics, 1990) illustrates that women may constrain their own progress toward liberation by the traditional nature of their demands. If Nicaraguan women's claims are more feminine than feminist, leading them to support a traditional female candidate, then that position can still improve women's lives. But it will also restrict long-term progress toward women's liberation, a constraint that is only partly the responsibility

of the government and parties. Ironically, the strength of Isbester's work—her emphasis upon identity within social movement theory—is also its weakness. While identity theory enhances RM theory, the stress upon recognition instead of redistribution, identity instead of empowerment, leaves women's demands constrained and their responsibility for those constraints unrecognized.

Nevertheless, Isbester deserves credit for her extensive research and data collection in a nation where both are extremely difficult. She has also shown considerable courage in her willingness to criticize the Sandinistas. Her work demonstrates that the revolution did not produce gender equality, while the Chamorro regime may well have slowed progress forward. The question of why that is the case still remains to be fully explained.

In sum, these volumes make substantial contributions to our understanding of political development in Latin America and of the fate of women within progress. The shortcomings of the volumes in no way undermine the contributions they make but, rather, point toward new avenues of research and additional theoretical considerations of the findings they offer.

A decade after the epochal events of the late 1980s and early 1990s, we have come to see them not as quasi miracles the way we did then but almost as prosaic way stations in the ever-present process of societal change. To be sure, there has been a stream of often pathbreaking scholarship in the fields of comparative politics and political sociology, with a special emphasis on social movements, civil society, the transition from authoritarian to democratic societies, and the complex consolidation of the latter that has rightly contributed to the demystification of these events. Yet, as citizens as well as scholars, we still remain so riveted by what happened in those few years in East Central Europe that the point of diminishing returns potentially afflicting additional research and writing on the subject remains distant.

All three books under review here do both things brilliantly: They demystify and explain with intellectual acuity and scholarly rigor, but-precisely by doing so-they also show what an amazing, indeed unique, time this was. The three books share a few important features. They concentrate on the same geographic area. Grzegorz Ekiert and Jan Kubik focus on Poland, though in an explicit, if subordinate, comparison with Slovakia, Hungary, and East Germany. John Glenn's book, the most overtly comparative of the three under review, analyzes Poland and what then was still Czechoslovakia. And Christiane Olivo features the former East Germany. While Olivo and Glenn concentrate their analyses on what could be called the transition processes narrowly construed—that is, the key events and rapid changes of 1989 and 1990 proper-Ekiert and Kubik are more interested in the aftermath of these events, thus the years 1989 to 1993. Lastly, all three studies are deeply steeped in the extensive literature in comparative politics, political

theory, and political sociology that—in good part, though not exclusively-emerged precisely as an attempt to place these amazing events into a proper theoretical framework and to use them as important empirical cases to expand already existing theories. In particular, all three books give much space to erudite discussions of the vast literature on civil society in which East Central Europe has arguably played the most important geographic and conceptual catalyst. They do the same for the so-called new social movements, where the literature of the 1970s and 1980s that focused almost exclusively on Western Europe and North America received a most welcome theoretical infusion in the 1990s by having to incorporate the events in East Central Europe of the late 1980s and early 1990s. All three books show their authors' fine command of the "transition" and "consolidation" literatures, which—again featuring the events in East Central Europe under consideration—have arrived at important theoretical insights by comparing the changes wrought in that part of the world to ones in Latin America roughly at the same time and to those in southern Europe circa a decade earlier.

Ekiert and Kubik pursue a simple question in their study: What is the role of protest in the consolidation of a new democracy? The book at hand is merely the Polish part of a large cross-national study that presumably will at some point yield similar monographs on East Germany (which the authors classify together with Poland as being a fast reformer) and Hungary, as well as Slovakia, which Ekiert and Kubik classify as slow reformers. The authors explicitly write the story of what they call "non-elite actors constituting civil society" (p. 12). In what to me was arguably the most informative part of their book, they present two introductory chapters in which they anchor their subsequent detailed study in its proper historical context. It is via the fine narrative of these two chapters that we truly come to understand what the authors rightly call "Polish exceptionalism," meaning a rich tradition of protest and dissent that became an integral part of Polish politics and society from 1956 until 1989, and which was so woefully absent in virtually all other socialist countries of East Central Europe. While East Germany and Czechoslovakia—the two other cases in the books under review—did in fact experience unrest of their own (1953 in the former, 1968 in the latter), neither had anything near the string of crises that mobilized thousands, even millions, of Poles in 1956, 1968, 1970, 1976, and 1980/81, to mention the most salient events of protest. To their immense credit, Ekiert and Kubik offer a persuasive picture of what could be called a failed de-Stalinization, in the sense that the ruling institutions of the state and the Communist Party simply could never recoup the authority and power that they had before Stalin's death. According to the authors, these two pillars of the communist establishment basically spent the next three decades futilely fumbling for a proper mixture of repression and concession that was inherently doomed because it could never fulfill the rulers' needs nor the people's wants. With this excellent background, it comes as little surprise that, in a sense, we actually read the story of a continuity—that of the Polish exception—instead of that of a massive change that we fully expected, given the enormity of the shifts in 1989/1990.

This is not to say that there did not occur an immense increase in the quantity as well as the audacity of protest politics after 1989. Ekiert and Kubik demonstrate in their immensely data-rich study how Poles came to embrace protest as an integral part of their quotidian politics in the early 1990s. Indeed, using some comparative data with the other three countries of the larger study, it is clear that Poles were much more active protesters between 1989 and 1993 than East Germans, Hungarians and Slovaks, in that order. But even this bevy of protests on every imaginable level of society and for—as

well as against—virtually all possible causes still puts Poland in the medium range of protest politics in a list of advanced industrial democracies, and well behind the peak periods of the latter, which they experienced in the late 1960s and early 1970s. Ekiert and Kubik conclude their study with a sober assessment of protest politics as an integral aspect of functioning democracies and remind us once again how a deep understanding of any ancien regime's intricacies is indispensable for the proper assessment of any new order.

It is here that Glenn's work is by far the most daring of the three, yet ultimately fails to fulfill his own immensely ambitious goals. In a genuinely comparative work, Glenn sets out to explain how the changes in Poland and Czechoslovakia occurred, and—of equal importance—what rendered them so different from each other. Anchoring his work in the literature on social movements, political bargaining, and opportunity structures, Glenn makes the powerful argument that the eventual outcomes of these two "revolutions" owed at least as much to the former framework and actual demise of what he calls "Leninist regimes" as they did to what the "revolutionaries"—a broad-based 10 million-member trade union in Poland and a tiny minority of intellectuals and actors in Czechoslovakia—attained during the heady days of 1989. But unlike Ekiert and Kubik, who also invoke events of the ancien regime to buttress their case of the present, Glenn does so too meekly and unsystematically. For Glenn's argument to be really persuasive, he would have had to dwell at least as much on details of these Leninist regimes as he did with such distinction on the actors in the Polish and Czechoslovak events. What were these Leninist regimes? How did they operate? How, if at all, were they different in Poland and Czechoslovakia? What happened to their major carriers once they were confronted by what clearly amounted to the most fundamental challenges to their political existence, possibly their very lives, as was the case in Hungary in 1956? Why did they not resist? Especially in the Czechoslovak case, which Glenn correctly characterizes as witnessing the Leninist regime completely ensconced in power until the middle of November 1989, why did the Leninist regime not choose the Tienanmen Square option? With this side of the story never told, the book falls victim to its own immensely laudable ambition. Lastly, Glenn's jargon-laden language rendered the reading of his intellectually exciting project unnecessarily cumbersome.

While less central to Olivo's project than to Glenn's, she, too, fails to address why the East German regime did not pull the trigger at the Leipzig demonstration on October 9, 1989, thus foregoing a "Chinese solution" for which the state was fully prepared and equipped. Unlike in Poland where the Leninist regime was gradually hollowed out after 1956, as Ekiert and Kubik show, in East Germany and Czechoslovakia it remained strong to the very last minute, simply opting to implode in a most precipitous way. One thing is quite clear: The citizen movements that are the focus of Olivo's study most certainly represented no threat to this regime at all and would have been easily defeated had the international system not changed so rapidly on account of the Gorbachev-led reforms in the Soviet Union. Her book on the East German citizen movements and opposition is the finest that I have read on this topic. It tells the story with rigor, and her analysis is based on meticulous research. And still, I am discomforted by the essential thrust of her argument that is nothing short of a paean to deliberative or participatory democracy that Olivo sees as superior in form and content to the lifeless proceduralism of liberal democracy. I concur. Where we part company is her glorifying description of the East German citizens' movements, which Olivo extols as agents of precisely such a "real" democracy and whose importance she overestimates massively, particularly when she spends a substantial part of the last segment of her book trying to convince the reader that these movements' significance continues in today's eastern states of a united Germany. Like most enthusiastic advocates of deliberative democracy, Olivo, too, assumes that the participants in it and its very nature must always be emancipatory, liberating, egalitarian—simply congruent with the author's laudable moral preferences. Above all, there is always the explicit assumption that something about these movements renders them "authentic," as opposed to the implied and alleged inauthenticity of form-obsessed liberal democracies. There is an underlying tenor throughout the book that had the West Germans not "taken over" the unification process and thus East Germany, these authentic and democratic citizens movements would have dominated East Germany and made it into the most—perhaps only—democratic society in Europe (perhaps the world).

Alas, as we now know about East Germany during the 1980s when Olivo correctly locates the nascence of these enlightened movements, far more typical for that society's counterhegemonic challenges than these democratic social movements were the growing racism, anti-Semitism, and xenophobia that engulfed much of East German civil society. And way beyond the East German case, there is simply neither a conceptual nor an empirical guarantee that deliberative democracy will always favor the "good guys" and exclude racists, bigots, and enemies of the very democracy that Olivo (and I) extol. By having been perhaps a tad more detached in her normative sympathies vis-à-vis these commendable citizen movements, Olivo could have shed more conceptual light on the relationship between these uniquely intense manifestations of democratic politics and systemic instability and transition. Could it be that these kinds of democratic arrangements are particular to precisely such periods studied by Olivo? Might it be that the normalcy of quotidian politics somehow remains inimical to such highly involved and exacting expressions of democratic participation? Gauging from the Ekiert and Kubik book, there is some evidence in this direction since in the Polish case, the Citizens' Committees-roughly the Polish equivalents to Olivo's East German protagonists—became the first casualties of the emerging political parties.

Japan's Economic Dilemma: The Institutional Origins of Prosperity and Stagnation. By Bai Gao. Cambridge: Cambridge University Press, 2001. 328p. \$54.95 cloth, \$19.95 paper.

Takaaki Suzuki, Ohio University

The once-formidable Japanese economy has fallen upon hard times. After posting a roughly double-digit rate of real annual growth from the mid-1950s to the early 1970s, and generally outperforming the economies of other advanced industrial democracies during the 1970s and 1980s, the Japanese economy suffered a prolonged period of stagnation throughout most of the 1990s. Given this dramatic reversal, Bai Gao sets about the ambitious task not only of explaining why the Japanese economy has soured, but of providing a broad institutional framework that underscores the common factors behind the high growth period, the bubble economy of the 1980s, and the collapse of the bubble in the 1990s. To achieve this task, Gao applies what he terms "the logic of reverse reasoning"; he takes the rise and collapse of the bubble economy as the "starting point for theoretical reasoning," examining the institutional mechanisms that purportedly produced it. He then works backward in time to reexamine how these institutional mechanisms operated during the high-growth era, and to identify the "environmental changes" that account for the reasons these institutional mechanisms produced such varied outcomes over time (pp. 6–7).

Following a brief introduction in Chapter 1, Gao presents in Chapter 2 his main theoretical arguments. The key independent variable that emerges from his analysis is the collapse of the Bretton Woods system. According to Gao, the breakdown of Bretton Woods triggered two "structural shifts": a shift from trade and production to finance as the predominant mode of economic expansion and exchange, and a shift from an emphasis on social protection to one that accords greater primacy to the market (pp. 22-29). After identifying these two shifts as the crucial "environmental changes" that altered the basic setting upon which the Japanese economy functioned, he then proceeds to locate two key types of domestic institutions that filtered these changes to produce radically different economic results. The first involves the institutional configuration of Japanese corporate governance. In Gao's estimation, coordination and control are "two intrinsically conflicting tasks of corporate governance," and the Japanese case represents one that has placed, since the 1950s, a heavy emphasis on the coordination of contractual exchange among separate companies at the expense of corporate control and management (pp. 30-33). The second entails the institutions and mechanisms that safeguard social stability. Here, too, he sees an apparent trade-off between social stability and economic efficiency, and he generously places Japan alongside European countries in its commitment to social stability, as measured in terms of its ability to maintain "total employment" and income equality at the household level (pp. 40-43).

In Gao's analysis, these two domestic institutions were optimally situated to produce and sustain high economic growth during the Bretton Woods era, when exchange rates were fixed and trade and production remained the dominant mode of economic expansion and exchange. The former provided unlimited capital to Japanese manufacturers for production and trade, while the latter fostered the political stability necessary to stay the course. However, with the collapse of Bretton Woods and the two "structural shifts" that emerged in its wake, Gao argues, these two domestic institutions became more a liability than an asset, producing speculative investments in real estate and the stock market while protecting inefficient sectors of the economy. After the bubble was created, it was simply a matter of time, according to Gao, before it would burst to produce the economic stagnation witnessed in the 1990s (p. 243). In support of such claims, the empirical core of the book examines in detail the evolution and performance of these two types of institutions in chronological order.

Japan's Economic Dilemma is a fascinating book, and there is much to be gained from studying its theoretical arguments and historical approach. Perhaps the most striking aspect of this book is its effort to identify and integrate long-term structural shifts in the global economy with an analysis of domestic-level institutions, and to do so by incorporating key insights from a wide range of disciplines. In just his analysis of the global economy alone, Gao draws heavily on the work of the historical sociologist Giovanni Arrighi (The Long Twentieth Century, 1994), the economic models of Robert Mundell and Robert Triffin, and the hegemonic stability literature in the study of international relations. Though laudable, however, Gao's effort to combine these different insights into a single framework would have been more persuasive had he provided a more detailed analysis of how these separate insights are tangibly linked together. Unfortunately, the theory chapter devotes fewer than six pages of text to this part of his analysis. This is somewhat understandable; the book's main focus is on tracing the transformation of the two types of

domestic institutions from the high growth period to the bubble economy. However, since the global shifts that the author identifies are the key independent variables that trigger this transformative process, which in turn allegedly produce the different economic results he ultimately seeks to explain, a greater elaboration of the causal mechanisms behind these global shifts would have clarified some ambiguities in his analysis.

To give an example, Gao repeatedly asserts that the "Mundell-Flemming trilemma" was the key factor that produced the speculative bubble (pp. 14, 38, 54, 153, 171, 245), but it is not entirely clear from his analysis why this is so. The basic insight of the Mundell-Flemming model is that a country can only achieve two of the following three objectives: a fixed exchange rate, monetary autonomy, and capital mobility. With the collapse of the fixed exchange-rate regime, monetary autonomy could presumably be maintained even with the liberalization of capital in the post-Bretton Woods era, especially in the case of Japan, given the large size of its economy, its persistent current account surplus, and the large pool of domestic savings. Gao even seems to recognize this point when he argues that there were, in fact, two bubbles in the post-Bretton Woods era (one in the early 1970s, the other in the late 1980s), and that both were caused by combining an expansionary monetary policy with an expansionary fiscal policy (pp. 154–157). But then, in a somewhat puzzling turn, he remarks later in the same chapter that the "bubble did not appear" in the 1970s case because "the Bank of Japan kept raising interest rates" (p. 182). Putting aside the question of how one reconciles these two propositions, or whether indeed Japan adopted an expansionary fiscal policy in the late 1980s (a point refuted by Yukio Noguchi, "Budget Policymaking in Japan," in Samuel Kernell, ed., Parallel Politics: Economic Policymaking in Japan and the United States, 1991, p. 139), the reader is left wondering how the bubble economy can be traced to the Mundell-Flemming trilemma. Indeed, Gao's own remarks suggest that the Japanese government simply made bad, but avoidable, macroeconomic policy decisions.

This last point raises the broader question of where political institutions and political agency fit into Gao's analysis. The two key types of domestic institutions that are the main focus of the book reside primarily in the Japanese corporate sector, and they are posited as "dilemmas" or "two pairs of intrinsic contradictions in capitalist economies" (p. 265). Gao provides persuasive theoretical reasons why they embody these contradictions and gives ample empirical evidence to prove his point. But missing in this analytic framework is the relationship and potential contradiction between a democratic polity and a capitalist economy, or between politics and markets more generally. Also missing are the domestic political factors that account for specific macroeconomic policy decisions. Accordingly, while his institutional "dilemmas" serve to reveal important economic trade-offs within the corporate sector, his analytic framework does not adequately explain the variations in Japanese macroeconomic policy decisions that are crucial to his argument about Japan's economic performance. Indeed, one wonders whether the economic stagnation of the 1990s would have been as deep and prolonged had the Hashimoto administration not killed the economic recovery underway by adopting a contractionary fiscal policy in 1996.

These problems aside, *Japan's Economic Dilemma* makes a significant contribution to the comparative literature on Japanese political economy. Whether one agrees with its arguments and assessments or not, its theoretically innovative and historically grounded study of the private sector institutions that manage corporate governance and social stability adds an important, and often neglected, dimension to our

understanding of the challenges that confront the Japanese economy.

Local Partnerships and Social Exclusion in the European Union: New Forms of Local Social Governance? Edited by Mike Geddes and John Benington. London: Routledge, 2001. 254p. \$90.00

Duane Swank, Marquette University

This book, the product of collaboration by an international team of European social scientists, focuses on the emergence and operation of local partnerships to combat social exclusion in European Union nations. This timely study is built on case analysis of samples of local partnerships in 10 EU nations; seven are given chapter-length treatment in the book. The central goals of the authors are to explain the cross-national diversity in frequency and form of local partnerships and their successes and failures in addressing poverty and social exclusion.

In two introductory chapters, the editors synthesize a substantial amount of relatively well-known material about the "new poverty" and social exclusion. Social exclusion is rooted squarely in the process of postindustrial transformation of European societies. Post-OPEC macroeconomic performance problems, de-industrialization, internationalization, and associated sociocultural changes and fiscal pressures on developed welfare states have contributed to general rises in poverty and structural unemployment; more fundamentally, they have contributed to difficulties of access to fulltime employment, health, housing, education and training, social services, and the political process for increasing numbers of citizens. Young as well as older workers, the disabled, women, migrants, and racial and ethnic minorities are more likely than other social aggregates to be socially excluded from full participation in economic, social, and political life. Moreover, these socially excluded populations are typically geographically concentrated in de-industrialized urban areas, ethnic ghettos, spatially isolated public housing projects, and some rural areas.

In the view of the authors, the institutional strategy of local partnership is, in theory, particularly well suited to address spatially concentrated poverty and social exclusion in an era of retrenchment and restructuring of national welfare states. Local partnerships consist of collaborative efforts among the public sector, employers and labor unions, voluntary groups, and community organizations to coordinate, implement, and, occasionally, formulate policies to ameliorate poverty and joblessness, as well as promote social and political inclusion. Partnerships are horizontal in that local associations typically anchor the network of collaborative relationships. However, partnerships are also vertical in that networks of international, national, regional, and local governments (and occasionally private market and voluntary associations) simultaneously participate in, and often lead, local collective action. In fact, local partnership has been most centrally promoted by the European Union, especially in implementation of EU Structural Funds and EU Poverty 3 programs.

From the perspective of proponents, local partnerships may foster experimentation and innovation in social policy content and delivery; they may also prove far more flexible and adaptable in combating the multifaceted problems attendant on contemporary (spatially concentrated) social exclusion than extant welfare state structures. In addition, they may harness, and coordinate application of, a variety of nongovernmental resources and, thus, supplement fiscally constrained public budgets. Moreover, partnerships may foster participatory and associative democracy and, thus, potentially lesson

the legitimacy problems of the democratic state in postindustrial capitalism.

The volume offers relatively extensive evidence on the disparate records of local partnerships in seven countries. Mikko Kautto and Matti Heikkilä assess the very limited development of local partnerships in the context of a centralized, universalistic, and social democratic welfare state, Finland. Patrick Le Galès and Patricia Loncle-Moriceau provide a similar analysis of France, where the dirigiste system, weak private market and voluntary associations, and few precedents contributed to the irregular and limited development of local partnerships. For Germany, Karl Birkhölzer and Günther Lorenz also highlight a modest development of local partnerships. Here, with the exception of the social corporatist Alliance for Jobs, partnerships have been principally championed by voluntary organizations and only weakly supported by Land and EU resources. Fernanda Rodrigues and Stephen R. Stoer's case study of Portugal and Jordi Estivill's analysis of partnerships in Spain offer similar assessments of the ways in which economic and political structures and policy legacies have shaped and limited local partnership development on the Iberian peninsula. On the other hand, Jim Walsh's analysis of the Irish case, and to a lesser extent Mike Geddes's case study of partnerships in Britain, demonstrate that local partnerships have emerged in significant numbers and achieved modest successes in some contexts. The Irish case is most notable. In the context of a national social corporatist strategy to manage economic restructuring, the national government sponsored roughly a hundred partnerships among local governments, the social partners, and community associations to target long-term unemployment, poverty, and

The case studies and comparative analyses generate two major conclusions. First, despite the growth of poverty and exclusion and EU pressures and incentives to pursue the partnership strategy, the degree and form of development of local partnerships have been fundamentally shaped by national welfare state structures, overarching configurations of national political institutions and culture, and recent policy legacies. Second, the rhetoric surrounding the potential benefits of the partnership strategy, especially at the EU level, far exceeded the reality of actual development and accomplishments. In fact, the volume's authors point out that despite discrete examples of moderate success, the paucity of policy evaluations and data collection by the partnerships themselves make it very difficult to gauge partnership impacts on poverty, unemployment, and social exclusion.

Overall, the volume makes several contributions to contemporary welfare state studies. First, the book offers the most extensive documentation and analysis of local partnerships to date; it simultaneously provides a useful synoptic treatment of social exclusion in Europe. Second, it contributes to the large literature on EU policymaking by concretely depicting the complex dynamics of contemporary intergovernmental relationships and multilevel politics in antipoverty policy. Finally, the volume generates a variety of evidence for the debate on the degree to which contemporary welfare state change is dominated by path dependency, neoliberal convergence, or more hybrid reform trajectories of welfare state pluralism. In the area of local partnerships, the weight of the evidence suggests that while significant policy innovation is possible (as the Irish case demonstrates), welfare states remain heavily path dependent in spite of the significant challenges posed by the new poverty and social exclusion.

Despite these contributions, the book is weakened by three sets of problems. First, other than a conceptual discussion of social exclusion and partnership, the editors do not pro-

vide a theoretical framework to systematically orient the case studies and comparative analysis. The book would have been much stronger had the authors more explicitly grounded the study in the contemporary literature on welfare state change, and organized the case studies around a core set of hypotheses on how features of welfare state regimes, national political institutions, and extant distributions of political power should shape the development and success of local partnerships. Second, the design of the study could have been improved. Ten countries were chosen for study on the grounds that they are arguably representative of the political, economic, and social diversity of Europe (and seven of these are highlighted in the book). The authors proceeded by collecting data on six to eight partnerships per country and by intensive analysis of three of these. However, the sample seems heavily weighted to southern Europe with Portugal and Spain (and Greece) included, while only Finland among the Nordic systems was selected. Moreover, the authors admit that the samples of partnerships for general or intensive analysis were not selected randomly. The upshot of these considerations is, of course, that the reader must wonder about the degree of distortion (e.g., from nonrandom samples) present in the case study and comparative conclusions. Finally, both the comparative and case study analyses lack rigor. Other than one summary table of the frequency of partnership participation by type of actor, little in the way of systematic evidence from the individual partnership studies is presented. In addition, widely used EU and Organization for Economic Cooperation and Development data on poverty, long-term unemployment, features of social exclusion, and national welfare programs are notably underutilized throughout the volume. In sum, an orienting theoretical framework and substantially more rigor in design and execution of the study would have led to a much better book.

With these qualifications in mind, the book can still be recommended to students and scholars of European political economy, public policy, and politics. It is appropriate for both upper division undergraduate and graduate courses.

Presidents, Parliaments, and Policy. Edited by Stephan Haggard and Mathew D. McCubbins. Cambridge: Cambridge University Press, 2001. 376p. \$70.00 cloth, \$25.00 paper.

Scott Mainwaring, University of Notre Dame

The core message of this book comes through clearly in every chapter: Formal political institutions affect economic policy-making and—less directly—policy results. The book advances thinking about how institutions affect policymaking, especially about how political institutions affect the stability (or resoluteness) and adaptability (or decisiveness) of policy.

The book brings together a superb group of collaborators. Many of them had previously made major contributions to the analysis of political institutions; others had done so on political economy. Here they work at the intersection of these two fields.

Chapters 2 and 3 lay out the basic theoretical framework of the book, and for this reason I single them out for most attention. Chapter 2, "The Institutional Determinants of Economic Policy-Making" by Gary Cox and Mathew McCubbins, lays out an institutionalist approach to political economy in broad and bold terms. The authors begin with a distinction between the legal separation of power and a separation of purpose, which means that a multiplicity of actors with different preferences, rather than an essentially unitary actor with virtually similar preferences, controls some points of power within the state. They note two key democratic

tradeoffs: first, between the capacity of state leaders to undertake sweeping policy change ("decisiveness") and policy stability ("resoluteness"); and second, between public- and private-regardedness of policy. They argue that how democracies tackle both trade-offs depends on the incentives created by political institutions. Other things being equal, one would expect greater policy stability and less capacity to undertake policy change when there are many veto players and when actors have a greater separation of purpose. The separation of purpose, in turn, depends on incentives to cultivate a personal vote, the electoral rules that affect the number of parties, and party factionalization.

Although this chapter does an excellent job of presenting big-picture hypotheses about the effects of institutions on economic policymaking, initially Cox and McCubbins claim too much for institutionalist arguments. They do not substantiate their sweeping statement that "the diversity of economic policies is rooted in the diversity of democratic institutions in each country" (p. 21). Different ideas about the economic policies that are most effective, differences in economic objectives, and the preferences of top-level policymakers (the president, his/her ministers, and the heads of the Central Bank and a few other powerful economic policymaking agencies) also have a significant impact on the diversity of policies pursued. The distribution of power in different societies also affects policymaking; institutions do not function in a vacuum, but rather in the context of societies in which structural factors are important. Other works by Cox and McCubbins acknowledge these points, but some of their claims in this chapter

Even if institutions fully determined the extent to which policy is decisive or resolute and public- or private-regarding, some institutions that are not in their analysis have a major impact on decisiveness. For example, other things being equal, the existence of an independent Central Bank bolsters policy resoluteness. The efficacy of the legal system affects whether policy is public- or private-regarding; with an ineffectual legal system, there are no sanctions against even patently corrupt private-regarding policies. Finally, they neglect presidents' constitutional powers, which, as Matthew Shugart and Stephan Haggard argue in Chapter 3, influence policy decisiveness.

The rest of the book presents less-sweeping claims about the impact of institutions on economic policymaking. In their excellent chapter, Shugart and Haggard focus on the tradeoff between policy decisiveness and resoluteness. They analyze how formal political institutions shape this trade-off in presidential systems, focusing on presidents' constitutional powers, electoral cycles, party-centered versus candidatecentered electoral rules, and the congruence of or divergence between the president's and congressional electoral constituencies. By analyzing presidents' constitutional powers, Shugart and Haggard include the institutional capacity of the executive to push change forward in addition to the institutional capacity of veto players to thwart it. They should include federalism in their list of factors that affect the "separation of purpose" because it allows a multiplicity of actors with different preferences to control policy and resources at the subnational level, frequently with important consequences for the resoluteness of policy at the national level.

Case studies about the impact of political institutions on budgetary policy (Chapters 4 to 6) and regulatory policy (Chapters 7 to 9) follow the two theoretical overviews. The authors all fruitfully view institutions as a package, rather than examining the effects of specific institutions in isolation. A few of the case studies stick closely to the initial theoretical focus on how formal political institutions affect the resoluteness of economic policymaking. Others (for example,

Mark Jones's fine chapter on how political institutions shape Argentina's budget policy) do not focus as tightly on this issue. Rather than pointing to a few institutions to explain economic policymaking across national cases, the case studies indicate that many different institutions have an impact.

Although this book advances the institutionalist agenda, the editors wisely acknowledge that it leaves open many questions. Perhaps foremost among them is the importance of institutions as opposed to other factors in explaining policy resoluteness—a thorny question about which cumulative knowledge is still limited. Ultimately, social scientists will need to test more rigorously the deductive hypotheses about the effects of institutions that the two theoretical chapters so compellingly chart. It is not clear how important institutional factors are, compared to such other factors as the commitment of the top-level economic policymaking elite to maintain or change policy. Institutions constrain and shape outcomes, but top leaders' preferences and abilities are also important. The book also leaves open the question of how formal institutions interact with structural factors in shaping economy policymaking.

Reforming Parliamentary Committees: Israel in Comparative Perspective. By Reuvan Y. Hazan. Columbus: Ohio State University Press, 2001. 216p. \$50.00.

Gary Jeffrey Jacobsohn, Williams College

This book is the result of a five-year research project that had as its goal the reform of the committee system in the Israeli Knesset. It had the full support of the leadership and members of that legislative body, and was conducted under the sponsorship of an important Israeli think tank, the Israel Democracy Institute. In undertaking this investigation, Reuvan Y. Hazan quickly discovered an additional reason for devoting so much time to this subject—the challenge of addressing "a flagrant deficiency in the political science literature" (p. 2), the dearth of comparative literature on parliamentary reform of committees.

In the end, however, it is the original impetus behind the book that is most strongly represented in the author's contributions to the scholarly literature. Thus, he is at his best when discussing reform possibilities in the context of recent structural changes that have occurred in the larger political system of Israel. While Hazan's comparative findings and analysis provide some useful perspective on proposals for reform, the somewhat perfunctory quality of these explorations prevents them from illuminating as much of the problem as one might have hoped.

Hazan begins his study with a summary of the purposes and functions of parliamentary committees that reduces to the two familiar categories of legislation and oversight, both of which are critical for achieving democratic accountability. He then introduces the comparative examples, chosen in each instance for their distinctive functions and structures, and for their relevance to the Israeli case. They are the British House of Commons, the German Bundestag, the Italian camera dei Deputati, and the Dutch Tweede Kamer. Each of the four chapters devoted to these studies considers several criteria, which serve as the "conceptual apparatus" that structures the argument and recommendations of the book. These criteria are concerned with the political environment affecting committees, their basic arrangements and procedures, methods of recruitment, leadership styles, and resources. The presentation of all of this material proceeds within the space of 33 pages, a detail noteworthy only for being suggestive of the rather sketchy analysis emerging from this section's comparative excursion.

It is certainly worthwhile to identify the distinctive features of these countries' political environments-for example, the lack of a written constitution in Britain, the ups and downs of Dutch consociationalism—but for there to be appreciable comparative dividends from this sort of research investment, more engagement with the political cultural underpinnings of law, parties, elections, and the like is required. If the functioning of a committee system is, as the author contends, critical in delivering on the promise of democratic accountability, then descriptions of the political environment need to penetrate more deeply into the underlying matrix of ideas that support extant institutional arrangements. For instance, Hazan mentions the lack of a written constitution in Britain as a contributing factor to explain the absence of any checks and balances on executive dominance of parliamentary sovereignty. But without reflection on the background to this anomalous constitutional tradition, it is not only difficult to determine why the lack of one (a written constitution) is related to the absence of the other (oversight); it is also impossible to establish with any confidence what implications follow for Israel, where the similarity in constitutional circumstance obscures a fundamentally different explanation for the political/constitutional environment.

When Hazan turns specifically to the Israeli political context, the results are better. While some of his recommendations for reform seem painfully obvious-for example, that committees should be filled with members who know something about the issues within their jurisdiction—the author's placement of the committee issue within the larger debate in Israel over the shape of the electoral system yields some quite interesting insights. Indeed, the author's analysis of the various phases of Israeli political development in the context of the general worldwide phenomenon of executive dominance of the legislative branch effectively clarifies the main issues on the agenda of committee reform in ways that inform beyond the immediate case at hand. In general, "[t]he goal of committee reform has...been to reverse the radical imbalance that has been created over time" (p. 78). Hazan's account of the various structural permutations of recent Israeli politics illustrates some of the limits and possibilities bound up in this effort.

In the early 1990s, several important reforms were implemented, the most important of which were the direct election of the prime minister, primaries for the selection of party candidates, and additions to the Basic Laws that led to an enhanced role for the judiciary in the enforcement of rights. The most innovative of these changes—direct election—was found wanting and has already been cancelled. But the uncertainty surrounding the question of whether the system had been transformed from a parliamentary to a presidential regime provides an analytic opportunity for fruitful comparative inquiry. It is in the context of these competing models, rather than in the somewhat formulaic application of crossparliamentary political variables, that one comes fully to appreciate the role of committees in establishing a democratic counterweight to the ascendance of executive power in constitutional polities.

Hazan's analysis could have benefited from greater attention to the available scholarly literature, in particular the pathbreaking work of Richard Fenno (Congressmen in Committees, 1973). It could also have profited from a more grounded and vivid presentation of the political environment, in which the reader might have come to know some of the actors prominent in the narrative of political reform that is otherwise ably presented. Reforming Parliamentary Committees has much to offer the student of the legislative process, but it only begins to remedy the political science deficiency that is projected in its ambitions.

A Fistful of Rubles: The Rise and Fall of the Russian Banking System. By Juliet Johnson. Ithaca, NY: Cornell University Press, 2000. 244p. \$29.95.

Gerald M. Easter, Boston College

For the field of Russian comparative politics, the collapse of Soviet communism abruptly shifted attention from commissars and commanders to businessmen and bankers. Since the mid-1990s, it has become increasingly evident that a small cohort of newly rich financiers was influencing the course of Russia's transition. Yet it was not always clear in what ways and to what extent these upstart tycoons were acting as political players. With this book, the field at last has an authoritative, systematic rendering of the banking sector. Juliet Johnson chronicles the good, the bad, and the ugly of Russia's big bankers during the postcommunist regime's formative decade.

By means of the banking case study, Johnson seeks to contribute to the larger theoretical debate on political and economic institution building, which continues to enliven post-communist studies. On this issue, she takes to task the advocates of the neoliberal-inspired "trickle down" approach, who, she contends, wrongly presumed that resetting macrolevel incentive structures would spontaneously give rise to Western-like institutions (pp. 21–23). Instead, Johnson argues that this reform strategy was flawed from the outset, given the inheritance of communism's command economy. "Institutional legacies are important," she maintains, "because they structure the initial power relations among the actors" (p. 20). The analysis is consistent with the conceptual premises of a "weak state," as opposed to a "grabbing state." It was the inability of existing institutions to readily adapt to the transition environment that created the opportunity for big bankers and the state to become intertwined in a way that ultimately led to crony capitalism, instead of a market economy. Moreover, crony capitalism, once entrenched, thwarted the further development of Russia's nascent democratic institutions during these fateful early years.

The theoretical assertions are based on the empirical findings of a single case study on the Russian banking sector from the initial reforms of 1987 to the financial crash of 1998. Comparison to other cases is limited to brief asides. The research focuses mainly on the big bankers in Moscow, although it also entails extended side glances at regional bankers in two Russian provinces, where the author conducted fieldwork. While some of the contextual material and anecdotes are by now quite familiar to specialists, the systematic focus on the banking sector makes for an original case study. The case is constructed largely from the Russian press, including previously untapped regional and specialist sources, and personal interviews with a number of well-placed banking officials. The evidence is presented in a well-organized and nicely written narrative, which leaves little doubt as to the author's opinion on things. The case study is especially good in its coverage of the unintended breakup of the Soviet banking system, the vexing role of the Russian Central Bank in economic reform, the mutually attractive benefits that first brought together the state and big bankers, and the desperate circumstances that later sundered their relationship.

To what extent does the case study support the theoretical claims? One main assertion is that unappreciated institutional legacies and inappropriate policy choices combined to produce undesired and distorted outcomes. The narrative provides ample anecdotal evidence to support this contention. For example, Johnson cites the case of the newly created Russian Central Bank, which Western advisors insisted must have institutional autonomy to insulate it from political pressures. In practice, however, the autonomous central bank

fueled inflation by generously issuing investment credits to unreformed enterprises, to the frustration of the Russian government and befuddlement of Western economists (pp. 69–73). The central bank's unexpected Soviet-like largesse demonstrates that outcomes are not determined by formal arrangements per se, but by the personal dispositions and informal ties of actors.

Another key assertion concerned the botched handling of fiscal policy that led to the 1998 ruble crash. "The ultimate cause," Johnson argues, "lay in the evolving relationship between the Russian state and the banking system" (p. 217). Certainly, there is no disputing that the government and the bankers had ensnared themselves in a short-term credit trap. But how does one reckon this development with other factors? The financial debacle can easily be explained with alternative "ultimate causes," such as the lack of elite consensus among the major political parties, the government's exchange rate policy, or the price of a barrel of oil. The research design, however, does not provide for an examination of alternative explanations.

Finally, the study claims that Russia's big bankers undermined the development of democratic institutions by forming patronage ties to politicians, penetrating the policymaking process, and disregarding the nascent middle class. While the study's introduction laid out several criteria to indicate how bankers may affect democracy, it was not obvious how these distinctions should be applied. When is a banker who finances an election campaign a democracy-supporting "interest group" and not a democracy-usurping "patron"? Johnson is convincing on how not to build democracy, but is less persuasive on a better approach. Her assertion that democracy requires property rights, impartial administration, and political accountability (p. 232) identifies institutional features associated with democracy, but begs the question of how to construct them. In conclusion, Johnson maintains, "[wle in the West have been slow to grasp Russia's status as a late developer" (p. 232). That may or may not be so, but democracy is hardly a trait commonly ascribed to late-developing states.

The book should enjoy a wide readership. The nontechnical prose and clearly presented argument makes this complex subject accessible to upper-level undergraduates. The book is probably better suited for graduate students learning their way around the maze of postcommunist Russian politics. For Russian specialists, the book provides a tidy packaging of the messy issues involving big bankers, the state, and economic reform. General comparativists likewise should profit from the richly detailed case study of commercial bankers and the state. Overall, the book is a noteworthy contribution to the study of the political economy of the postcommunist transitions.

Institutions and Innovation: Voters, Parties, and Interest Groups in the Consolidation of Democracy—France and Germany, 1870–1939. By Marcus Kreuzer. Ann Arbor: University of Michigan Press, 2001. 224p. \$52.50

Alice H. Cooper, University of Mississippi

As its title indicates, this book explores the links between institutions and innovation—specifically, between electoral systems and parties' capacity to innovate. The latter, in turn, is considered a crucial determinant of democratic performance because it shapes parties' capacity in times of economic crisis to offer policy prescriptions sufficiently attractive to limit voter defection to nondemocratic alternatives.

Marcus Kreuzer investigates these relationships by looking at France and Germany from 1870 to 1939. During the 1870–

1918 period, Third Republic France and imperial Germany had the same electoral law, the double-ballot system (singlemember districts and two-round elections with runoffs in the second round). During this period, the parties' main challenge was to adapt their campaign techniques and platforms to the advent of mass politics. Parties in both countries were "reluctant entrepreneurs" in this regard. For ideological reasons, for example, socialist and conservative parties were divided in both countries over whether to innovate, as new campaign techniques and platforms would violate traditional tenets. The important point, as Kreuzer argues, is that French and German socialist parties were more similar to each other than either were to the conservative or liberal parties of their respective countries, and vice versa. Under similar institutional configurations (electoral systems), French and German parties all behaved similarly, with the main differences between parties being ideologically driven.

After World War I, in contrast, French parties became more similar to one another than to their German counterparts, and vice versa. French socialist, liberal, and conservative parties were all relatively adept at modernizing their party organizations and responding to economic crises, whereas German socialist, liberal, and conservative parties failed on both counts. Why? France maintained its single-member-district two-ballot electoral system, whereas Germany's Weimar Republic introduced a system of virtually pure proportional representation (PR). Electoral institutions in the two countries differed dramatically from 1919 on, and these systems created dramatically differing incentives for innovation by parties as well.

Electoral mechanisms strongly influence candidate selection processes and levels of career uncertainty, campaign finance requirements, and levels of strategic voting. Thus, Germany's high district magnitude and vote-pooling mechanisms centralized the candidate recruitment process, reducing career uncertainty for individual politicians but destroying their autonomy from party leaders, and thus their opportunities for innovation. Large districts and frequent elections increased electioneering costs for German candidates and increased their dependence on financial benefactors—the party leadership and economic interests that contributed to party coffers. Finally, Germany's PR system eliminated incentives for strategic voting, so that political actors in turn had little incentive to adapt to shifts in voter preferences. In contrast, the effects of the French electoral system were to decentralize candidate recruitment and raise career uncertainty, keep campaign costs relatively modest, and encourage strategic voting in the second round. All three of these effects promoted innovation in policy platform and campaign strategy by French politicians, while discouraging them in the German

These relationships are not merely of theoretical interest, argues Kreuzer, but they also had huge implications for democratic performance in France and Germany. Both countries faced rampant inflation after World War I, horrendous industrial unemployment after 1929, and agricultural depression. Electoral mechanisms encouraged French mainstream party politicians to innovate sufficiently to keep voters' loyalties and discourage defections to the extreme right or left. In contrast, mainstream German politicians lacked such incentives, and their parties lost voters in droves to the upstart communist and Nazi parties. The rest, as the saying goes, was history.

In this elegantly argued and very well written book, Kreuzer roots himself explicitly in rational-choice institutionalism, and he uses it to explain the historical differences between French and German interwar democratic performance. To complement the rational-choice institutionalism.

he argues that historical contingency and contextual factors interact with institutions and limit their effects. Rearranging his empirical material into national, cross-party comparisons (holding institutions constant so as to observe the impact of contextual factors), he finds that "history matters since neither did all French parties retain their level of support nor did all German parties lose votes at the same rate" (p. 159). Moreover, while the effects of strategic voting and career uncertainty were relatively consistent across the various parties in both France and Germany, the effects of electioneering costs varied, depending on the logistical endowments of parties; Germany's liberal parties suffered much more than other parties. So, concludes Kreuzer, "the influence of historical contingency varies with different institutions" (p. 161). These are welcome insights, but even for a concluding chapter they are developed somewhat sketchily.

As for democratic performance, Kreuzer joins the fight against the various theories of German "exceptionalism," which account for National Socialism in terms of such longpast events as failed democratic revolutions. Instead, he sides with those who argue that German development was not so very exceptional, and he points to the effects of contemporary, Weimar-era (electoral) institutions to account for the failure of democracy there. Thus, while he bases his argument largely on structural factors (as opposed to relying simply on historical contingencies like the Versailles Treaty or the Great Depression), these structural factors are contemporary, rather than rooted in the distant past. These insights also have considerable appeal.

Although Kreuzer's argument seems persuasive in terms of explaining the differences in party and democratic performance in France and Germany, questions arise as to the generalizability of the argument. In my view, the book would have been considerably strengthened by a chapter which (briefly!) tested his argument in at least several more cases. To this reader's "naked eye," it is not immediately clear why, in the 1930s, the Swedish Social Democrats were able to innovate (by adopting Keynesianism) despite their system of proportional representation, whereas the German Social Democratic Party (SPD) failed to adopt (proto-)Keynesianism before 1933 because of (in Kreuzer's view) the incentive structure embedded in their similar (though not identical) PR system. Similarly, in the 1930s, the British Labour party failed to adopt Keynesianism despite their single-member-district system, which presumably shared many incentives with the very French system that enabled French socialists, according to Kreuzer, to adopt Keynesianism. (Although it lacks the French system's second ballot, the incentive structure of the British system is surely closer to the French system than to PR, given the single-member districts in each).

An answer to such questions might require a more detailed exploration of the relationship between institutions and historical contingency than that presented in Kreuzer's elegant treatise. One place to start would be with intraparty politics; recent literature points to its importance for successful adaptation to changing competitive environments. For example, Herbert Kitschelt's (1994) The Transformation of European Social Democracy relates the innovative capacity of social democratic/socialist parties in the 1980s to their internal organizational structures and distribution of power. Both Kitschelt and Frank Wilson, in "The Sources of Party Change" (in Kay Lawson, ed., How Political Parties Work, 1994), point out the impact of particularly effective leaders. Finally, Sheri Berman ("The Life of the Party," Comparative Politics, 30, no. 1 [1997]: 101–23) points to the importance of historically rooted ideological flexibility; the Swedish Social Democrats' practice in forging crossclass coalitions (with farmers in the 1930s and middle-class groups in the 1950s) was replicated in the party's undercutting of the Swedish Greens by coopting postmaterialist themes in the 1980s. To push Kreuzer's line of research further, it would be quite fascinating to investigate in greater depth whether or how electoral systems contribute to any of these conditions, particularly to parties' internal organization. One would also want to know more about how parties in PR systems do in fact manage to adapt over time, given Kreuzer's argument that PR systems contain disincentives for innovation.

State Formation and Democracy in Latin America, 1810–1900. By Fernando López-Alves. Durham, NC: Duke University Press, 2000. 295p. \$49.95 cloth, \$17.95 paper.

Lawrence Boudon, Library of Congress

One of the most vexing questions posed over time by political scientists is: Why do democratic polities develop in some countries, but not in others? In his seminal work Social Origins of Dictatorship and Democracy (1986), still read today by most students of comparative politics, Barrington Moore strove to answer that question by examining the historical process in which commercial agriculture emerged in Britain, France, Germany, Russia, and China. In his book, Fernando López-Alves takes the framework that Moore provided and applies it to three countries in Latin America whose trajectories in the nineteenth century led to different polities and experiences with democracy—Argentina, Colombia, and Uruguay (he also makes brief reference to Paraguay and Venezuela as so-called control cases). While conceding the need for "further testing" (p. 220), he arrives at conclusions that differ significantly from Moore's, even though he does not attempt to dismiss that earlier work.

Relying on historical data (and the comments of historians), López-Alvez argues eloquently how, rather than the conversion to commercial agriculture, it was conflict and the actors involved therein that shaped the polities of these countries. It mattered whether the state—making was carried out primarily by political parties (Colombia and Argentina) or by national armies (Argentina and Paraguay). The type of conflict—not the frequency—also mattered: "[T]he degree to which regime outcomes turned out more democratic or authoritarian [is] partially explained by whether the locus of the revolutionary wars was supported by the city or by the countryside" (p. 37). In Argentina, the military efforts were associated with urban elites, whereas in both Colombia and Uruguay, they involved rural-based caudillos.

Another important factor was the way in which the rural poor were mobilized: "The fourth and final claim is that the mode of incorporation of the rural poor into war and politics substantially shaped institutions and the type of resulting regime" (p. 44). In Colombia and Uruguay, the mobilization occurred via the political parties, resulting in weaker states but more inclusive polities. Uruguay was the most democratic due to the fact that there, the elites had less fear of rural uprisings than in Colombia. In Argentina (and Paraguay), incorporation was via the army, resulting in stronger states and restrictive polities. The other case examined, Venezuela, experienced mobilization by caudillo armies, also resulting in a more restrictive polity.

In this qualitative work, López-Alvez cleverly utilizes both the method of agreement, when comparing Argentina and Uruguay, and the method of difference, when comparing Uruguay and Colombia. The first pair share many similarities, making a comparison possible. The second pair have little in common, except for the mostly democratic outcomes. As he shows us, however, the conflicts in Uruguay and Argentina

differed. In Uruguay, wars were fought between followers of the urban-based Colorados and the more rural-based Blancos over control of the state. In Argentina, on the other hand, the wars were either against invaders or other countries, or were waged far from Buenos Aires, where a military developed that impeded, the author claims, the development of parties.

In the first chapter of the book, not only does López-Alves justify his research by reiterating some of the classic arguments on state building (i.e., Charles Tilly, Coercion, Capital and European States [1990]; Barrington Moore, Social Origins... [1986]; Ruth B. Collier and David Collier, Shaping the Political Arena [1991]; Michael Mann, The Sources of Social Power [1993]; and Dietrich Rueschemeyer, Evelyne H. Stephens, and John D. Stephens, Capitalist Development and Democracy [1992]), but he also makes clear why many of those works fall short in explaining the different outcomes of the state-building process in Latin America. He argues cogently that the key period for state building was not the late 1800s and early 1900s, as much of the existing scholarship posits, but the period from independence to the late 1800s, before most of the new countries had made the transition to commercial agriculture. By the end of the chapter, his argument is neatly laid out in a flow chart depicting the independent and intervening variables, a table comparing the five cases and their outcomes, and a single statement summing everything up: "In agrarian postcolonial societies, types of war and the type and scope of mobilization of the rural poor during state formation shaped institutions, civil-military relations, and regime outcomes" (p. 46). The statement is italicized in the book for added emphasis.

In the next four chapters, López-Alves proceeds to flesh out his argument by looking at each case in some detail, starting with Uruguay. Here, he underscores the sharp geographical divisions and the centrality of the two parties in state building. However, he also notes that it was the Colorado Party, under the enlightened leadership of José Batlle y Ordoñez, that crafted the most inclusive polity of the three major cases. The Colorados more firmly controlled the army, and the lack of a cohesive conservative opposition allowed Batlle to carry out social reforms. On the contrary, in Colombia, an alliance between the powerful Catholic Church and the Conservative Party resulted in a lack of reforms and a more restrictive polity, even though party mobilization was central there as well. In Argentina, he gives ample credit to Juan Manuel de Rosas, but notes also that Buenos Aires remained largely unscathed by the various wars, allowing for a stronger state to develop. Finally, he briefly examines Paraguay and Venezuela, both of which tend to confirm his findings, even though in the latter case, rural mobilization was different from the four other cases.

The book is a must read for anyone interested in the evolution of the state in Latin America, and it complements rather than supplants—some of the works previously mentioned. If there is any criticism of the book, it is that the conclusions are much too brief. The argument is restated too quickly, leaving the reader feeling somehow empty and not totally convinced. It would be indeed interesting to take the theories developed therein and apply them to the rest of Latin America, to see if they hold up elsewhere. How would they apply to Mexico, for instance? Mexico's wars were fought mostly against invaders, and peasants were mobilized by the army, at least in the 1800s; a party system did not develop. However, does the fact that the peasantry then rose up in revolution in 1910 suggest a new path, or a different outcome? And Mexico then evolved into a single-party dominant system that was largely restrictive. At a glance, then, it would appear to fit in with López-Alves's model, but the revolution is not fully explained. And what about other countries that experienced revolutions—Bolivia, Cuba, and Nicaragua? Are these separate outcomes that need to be explained? In the final analysis, I see this work as an admirable start and a valuable contribution to our understanding of Latin American politics.

Northern Ireland and the Divided World: The Northern Ireland Conflict and the Good Friday Agreement in Comparative Perspective. Edited by John McGarry. Oxford: Oxford University Press, 2001. 374p. \$65.00 cloth, \$24.95 paper.

David E. Schmitt, Northeastern University

John McGarry and a distinguished group of comparativists have produced a volume important not only for scholars interested in the study of Northern Ireland but also for those concerned with ethnic conflict and nationalism generally. Although its success is certainly not assured, the Good Friday Agreement of 1998, a consociational (power-sharing) settlement of the Northern Ireland conflict with international confederal dimensions, has sparked much interest by scholars and practitioners concerned with other ethnonational conflicts. The agreement was achieved with considerable pressure and support from international actors. The international community has played an increasingly important part in the resolution, management, and containment of ethnonational conflict, and the success or failure of the Good Friday Agreement may hold important lessons for international efforts elsewhere. From both a theoretical and practical perspective, this is a fine edited volume with internal coherence and useful contributions.

An introductory chapter by McGarry argues for the importance of comparative analysis of the Northern Ireland conflict. He documents the many instances in which politicians and partisans have used comparisons in advancing their cause, and he summarizes the various theoretical approaches to the analysis of the Northern Ireland conflict.

Part I presents five chapters dealing with theoretical and general issues. Rupert Taylor argues that a social transformation approach through group contacts, such as integrated schools, is the best solution for Northern Ireland's difficulties. From Rupert's perspective, consociationalism entrenches ethnic animosities. In an insightful analysis of the 1998 agreement, Brendan O'Leary emphasizes the need for a consociational and confederal settlement in such circumstances as the Northern Ireland conflict. He argues that one significant flaw in the agreement is the British Parliament's capacity to override its provisions, as it did in temporarily suspending the Northern Irish Assembly in the year 2000. O'Leary also takes issue with Arend Lijphart's work on the optimal electoral mechanisms within consociational frameworks. In a substantive chapter John McGarry also supports consociationalism as necessary for settlement, disagreeing with the criticism that power sharing entrenches ethnic identities and prevents the development of inclusive civic identities. He notes, for example, that the agreement has provisions requiring cross-community cooperation (e.g., consent by both unionist and nationalist members of the Assembly for election of the first and deputy first ministers). In a sophisticated critique of the agreement, Donald Horowitz argues that stark consociationalism is rare and risky in severely divided societies because, among other things, it can penalize moderate parties. As he has done in seminal earlier work, Horowitz advocates an incentives approach, consistent with majoritarian principles, that encourages moderation and crosscommunity elite cooperation and that prevents domination by ethnic majorities. Feargal Cochrane analyses the growth in the importance of peace-conflict resolution organizations

in the peace process. These organizations frequently arose with the goal of alleviating particular symptoms of the conflict and are diverse in their ideological objectives. In addition to promoting the inclusivist goals of moderate political elites in Northern Ireland, Cochrane notes that they also constituted an alternative path for people committed to paramilitary activity.

Part II presents seven case studies that compare Northern Ireland and the Basque Country, Canada, Lebanon, South Africa, and Israel/Palestine. This section also has useful chapters on "Lessons from Europe" by Anthony Alcock and a comparative analysis by Adrian Guelke of Ireland's status as an island. Alcock, who served on the Ulster Unionist Party team during negotiations on the Good Friday Agreement, maintains that its acceptability to mainstream unionists resulted partly from the fact that the cross-border aspects of the agreement were consistent with patterns in the European Union. Among other important issues was the renunciation by the Republic of Ireland of its constitutional territorial claim to Northern Ireland. Guelke argues that the international community supports the territorial integrity of islands and is sympathetic with the Good Friday Agreement partly because of its cross-border provisions, such as the North-South Ministerial Council. He offers insightful comparisons with the conflicts in Sri Lanka, Cyprus, and other islands

Michael Keating's chapter on the Basque Country notes that both primordialist and modernist analyses of the Northern Ireland and Basque Country are inadequate for explaining nationalism in these settings. Instead, a focus on political factors and the evolution of social forces provides more insight. Keating argues that identity in both cases is continually being made and remade. S. J. R. Noel's chapter on Canada focuses on the nineteenth-century consociational bargain developed in secret by Canadian elites themselves without significant outside interference. The fact that the Northern Ireland accord was not developed by the Northern Irish elites themselves augurs poorly, in Noel's view, for a successful long-term outcome.

The major obstacle to the success of the Good Friday Agreement has been the decommissioning of weapons by paramilitary organizations, particularly the Provisional Irish Republic Army (IRA). Kirsten Schulze's chapter compares the contentious nature of this issue in Northern Ireland with the successful and relatively quick decommissioning in Lebanon. Among the reasons examined for Lebanon's success was an explicit statement in the Ta'if Accord for a quick surrender of weapons, with harsh sanctions for violations. Also important were provisions for the reintegration of paramilitaries into the army and police. The chapter comparing Northern Ireland to South Africa by Padraig O'Malley is particularly strong in its guidelines for successful negotiation of settlements. In his discussion of the key similarities and differences between the two conflict and settlement processes is the argument that the actions of the African National Congress constituted a just war, while the violence committed by the IRA did not. Sammy Smooha's chapter compares partition in Israel/Palestine and Ireland, with a focus on partition as a mode of conflict regulation. He argues that partition is inevitable in the Israeli/Palestinian case, i.e., Palestine will become an independent state. By contrast, partition will probably weaken in Ireland, with the border becoming less relevant over time.

Scholars will inevitably disagree with some of the diverse perspectives and interpretations in this book, but all of the chapters are well done, with some representing significant contributions to the field. John McGarry and his colleagues have produced an important and interesting volume. Rational Choice and British Politics: An Analysis of Rhetoric and Manipulation from Peel to Blair. By Iain McLean. Oxford: Oxford University Press, 2001. 256p. \$65.00 cloth, \$29.95 paper.

Terrence Casey, Rose-Hulman Institute of Technology

In Rational Choice and British Politics, Iain McLean applies William Riker's concept of "heresthetics" to British political history. In contrast to rhetoric (the art of persuasion), heresthetics is "the art and science of political manipulation" (p. 10). Rather than trying to convince others of one's position, heresthetics is about transforming the question and altering political dimensions so as to change the rational calculus of key actors and manufacture a supportive coalition. McLean employs the device of "analytical narratives" (historical analysis informed by rational choice methodology) to explore critical junctures in British political development, including the repeal of the Corn Laws, the Second Reform Act, the signing of the Anglo-Irish Treaty in 1922, and the political and economic revolution of Margaret Thatcher. He also explores broader political movements, including the realignment of Victorian political parties and the attempts by Joseph Chamberlain and Enoch Powell to connect race and empire into winning coalitions.

How might a heresthetically informed narrative run? Take the repeal of the Corn Laws under Prime Minister Sir Robert Peel. Why would Conservatives in the Commons and the landed gentry in the House of Lords repeal a law directly benefiting them? Peel transformed the issue by linking it to the Irish famine, thus garnering almost all of the opposition Whigs to support him and only needing a segment of the Tories for passage in the Commons. (The rest voted for protection.) Peel then convinced the Duke of Wellington, leader of the Lords, that defeat would bring down the government. Seeing the issue not as tariffs but support for the queen's government, Wellington sank his energies into getting repeal passed in the Lords. By altering the question, Peel manufactured a winning coalition where there previously was none.

Overall, McLean's research is excellent, his writing is polished and witty, and his cases are well selected to cover some of the truly fascinating moments of British politics. But his ambition is to provide more complete accounts than rival explanations and use them to build theoretical generalizations (p. 17). Unfortunately, ambition exceeds result.

His cases are well-tread historical ground, and so the rationale for revisiting them is to gain new insights through the lens of rational choice: "[A]n analytical narrative in the rational choice tradition adds some points to the why" (p. 191). Does he provide better answers to the "why questions"? Take his account of the Anglo-Irish Treaty. Lloyd George was determined that negotiations not break down over Ulster, where the British position was weakest, and thus maneuvered the Irish delegation toward questions of the status of a free Irish state within the empire. But the Irish delegation was divided. The swing vote was Robert Barton, sent by Eamon De Valera to gain complete separation from the crown. The final treaty in fact granted dominion status to the Irish Free State. So why did Barton sign? The traditional view (as noted by McLean on p. 191) was that with the threat of renewed war looming, he cracked under the pressure after others agreed to sign. In McLean's narrative, Barton cracked because it became a "sequential signature game" with Barton as the last player. If he failed to sign, he would be solely responsible for war. The difference between the two interpretations is rather fine grained.

The plots of some of McLean's narratives also turn on rather selective or peculiar evidence. The Tories backed

Disraeli on extending the franchise because they "seem to have responded to the thrill of the chase" (p. 70). Joseph Chamberlain's imperial preference plan failed largely because he did not control an economic ministry (p. 127), discounting that Chamberlain's Conservative Unionists lost in 1906 (43.4% to the Liberals' 49.4%) on a campaign fought on free trade. For the Thatcher premiership, "the inescapable conclusion is that Mrs. Thatcher made people feel better because she won the Falklands war, not because of anything she or her government did for the economy" (p. 212). This ignores the economic recovery after 1982 and support for her government's actions to control labor unions.

McLean's narratives moreover fail to answer the most important why questions: Why did the key players adopt a particular set of preferences? Why did Wellington place service to the queen over a policy with which he disagreed? Why would the Lords reject Lloyd George's "people's budget" knowing that it might lead to their emasculation as an institution? Why did Michael Collins prefer dominion status over no agreement, while Eamon De Valera opted for the opposite, leading to the Irish Civil War? Why would Margaret Thatcher chant "there is no alternative" when common wisdom suggested it would lead to electoral disaster? Answering such questions would inherently raise issues of interests and ideology rather than strategic manipulation, concepts that McLean has difficulty capturing in his particular analytical net.

In his defense, rational choice explores political interaction among actors with a given set of preferences, not preference formation. Doing so allows assumptions and hypotheses to be deductively and logically connected, facilitating theory construction. So all might be forgiven if shortcomings in historical narrative were offset by theoretical gains. Regrettably, the integrity of McLean's theoretical framework does not hold throughout. His chosen herestheticians do not connect goals and strategy consistently across time. Some are cynically focused on electoral advantage (Disraeli), while others undertake quixotic crusades regardless of result (Enoch Powell). He does not provide any assumptions or arguments relating to when, where, and why heresthetics is employed, or the conditions under which it is likely to succeed (other than for case-specific reasons). Even within his cases, it is difficult to tell when interest or ideology or personality are at work, rather than heresthetics. Nor can one easily distinguish rhetoric from heresthetics in practice. McLean poses Thatcher as a (reluctant) heresthetician, but the quintessential "conviction politician" could just as easily be classed as a master rhetorician. As these choices become increasingly arbitrary, the clarity of the concept suffers, eroding the rationale for a formalized interpretation of these events.

Riker's The Art of Political Manipulation (1986), of which this book is clearly a progeny, was written as a manual for politicians as much as a theoretical text. Rational Choice and British Politics would be a useful read for Tony Blair. From a scholarly perspective, there are some novel and interesting parts to McLean's work, such as his analysis of parliamentary interest and ideology under Peel, or on the impact of Enoch Powell on the Conservative vote in 1970 and 1974. As a coherent theoretical approach, however, the work is lacking. Strategic manipulation is a useful addition to our analytical toolbox, but heresthetics does not appear to be as useful a tool as McLean implies. In terms of the general appeal of this work, those already converted to the theoretical utility of rational choice will find a clever and well-constructed application of these ideas. Those not already converted to this research tradition are unlikely to have their opinions swayed.

Out of the Red: Building Capitalism and Democracy in Postcommunist Europe. By Mitchell A. Orenstein. Ann Arbor: University of Michigan Press, 2001. 184p. \$54.50 cloth, \$22.95 paper.

Ellen Comisso, University of California, San Diego

Nowadays, it is easy to forget just how pessimistic observers were in 1990 about the possibility of simultaneously introducing capitalism and competitive politics to the ex-socialist states of Eastern Europe. Often, debates seemed to hinge simply on which would subvert which, that is, whether the economic shocks of reform would destabilize democratic governments or whether populist appeals to the losers of economic adjustment would derail economic reform. That popularly elected government and systemic economic change could mutually reinforce each other seemed, at the time, to describe a fool's paradise. Yet now that the dust has begun to settle, this appears to have been exactly what happened.

Mitchell Orenstein's new volume, a careful and astute comparison of the interplay between economic and political change in Poland and the Czech Republic after 1989, explores why this was the case. Orenstein argues persuasively that the alternation of parties in power made possible by electoral competition was a critical condition of sustainable reform. Rather than producing either economic or political instability, regular changes of ruling coalitions prevented leaders from outrunning or ignoring their constituencies, while allowing unpopular measures to be corrected and refined once their consequences—both social and economic—became known. Thus, he suggests, the Czech economy stumbled badly in the late 1990s precisely because it was the only country in the region in which incumbents were reelected. Filled with confidence as a result, the liberal coalition of Vaclav Klaus became overly dedicated to its voucher privatization program and antiregulatory platform, dismissing problems with enterprise governance and securities transactions as simply the predictable laments of the opposition, until finally, the Czech banking system began to implode. It was only in 1998 that a minority social democratic government took office and began to enact the measures to regulate banking and financial markets that its predecessor had steadfastly rejected. In Poland, political cohesion dissipated more rapidly. There, the political fallout from the radical "shock therapy" measures of 1990 not only forced early Solidarity governments to introduce modifications but finally brought a "left" coalition to power in 1993. Privatization subsequently moved more slowly and with greater attention to the constituencies affected by it, yet economic growth continued on the robust path that began in the early years of the decade. And even as the Right returned to power in 1997, it came back more willing to deal politically with the opposition, especially since much of the recalcitrance came from its own ranks.

Orenstein thus concludes that the key to sustainable reform in a democratic political order is a party system characterized by cohesion-oriented and market-oriented competitors that can alternate in power without leading to polarization. It is quite an unobjectionable thesis, but given that both of his cases are generally included in the "success" stories of the transition, it is not entirely clear that the evidence offers an appropriate test of the thesis. That is, while we may well approve of some governments more than others, it is not clear that the economy in either country performed significantly better than the other. Even with "cohesion-oriented" governments, unemployment in Poland was and is far higher than in the Czech Republic. Polish economic growth, once the valley of the transition was crossed, was more robust than that in the Czech Republic, but once one bears in mind the far greater

depth of the initial downturn and the far more disastrous state of the Polish economy in 1989, it becomes clear that the 1990s marked a recovery simply to the GDP levels reached under socialism in both countries—with a smaller and more productive labor force, a wider assortment of consumer goods, and greater inequality and unemployment.

In any case, Orenstein's volume is notable for its very informative analysis of political and economic change in highly turbulent times. It shows nicely that there is no single path to capitalism and that the ability to correct policy mistakes is at least as important as being able to select a strategy in the first place. The tale is told well, and the volume is well worth reading.

Resistance and Rebellion: Lessons from Eastern Europe. By Roger D. Petersen. Cambridge: Cambridge University Press, 2001. 338p. \$59.95.

Jan Kubik, Rutgers University

The most challenging task in today's comparative politics is crafting a fruitful combination of a general theory of political behavior with a nontrivial and sufficiently rich portrayal of that behavior's social, cultural, and historical context. At the same time, a consensus is emerging that holism is out, individualism is in, and the discipline's intellectual effort should be primarily focused on the reconstruction of the rules (mechanisms) governing the strategizing behavior of individuals in various social and cultural contexts. Macro-historicalstructural explanations are largely out of favor. Given this intellectual climate, the premium is placed on studies that employ rational choice/game theoretical framework and test its applicability and limitations in the study of non-Western political systems. Such tests of applicability inevitably involve a confrontation between slim and parsimonious gametheoretic models and detail-rich ethnographic or historical reconstructions. Sometimes such confrontations end up in fruitless, mutual acrimony; recently, however, they have led to many instances of cross-fertilization and productive revisions of both sides' analytical assumptions.

The tremendous merits of such cross-fertilization are amply represented in Roger D. Petersen's Resistance and Rebellion, one of the best works in the emerging new genre that seeks to combine formal theory and detailed ethnographic portrayal. The theory Petersen employs should be very attractive to comparativists. He approaches the problem of resistance and rebellion with an Olsonian dilemma in mind (Why should they rebel at all?) and shows that there are several mechanisms that account for people's move from passive acceptance of oppression to resistance and rebellion (or active collaboration). Those mechanisms range from rational calculation (instrumental rationality) to nonrational, psychological (for example, resentment formation or the tyranny of sunk costs) to social (community-based norms of reciprocity or types of community) to cultural ([non]existence of relevant focal points).

Building on the earlier works that analyze the tipping process (for example, Kuran Schelling, Dennis Chong), Petersen offers a more complex analysis of this process by demonstrating how it is influenced by such sociological variables as the community type or the distribution of normative orientations (linked to the membership in specific subgroups, each espousing a separate set of norms). Thus, he contributes to the welcome and long-overdue rehabilitation of sociology in the study of strategic behavior in political science (prominently signaled in the award-winning James D. Fearon and David D. Laitin's "Explaining Interethnic Cooperation," APSR 90 [December 1996]: 715–35).

The theoretically most elaborate part of the book (Chapter 2) is focused on a detailed and rigorous though quite accessible, modeling of the sociological mechanisms and group features that help to explain why individuals in certain communities (at certain times) tend to rebel against oppressors while others, embedded in different communities, tend to remain passive or collaborate. Petersen's model opens a way for a rigorous analysis of such attributes of the community as 1) the initial distribution preferences and constraints concerning the risk of rebellion; 2) the types of norms (of honor or family obligation, for example) that define the types of subgroups; and 3) the distribution of those subgroups within the larger community. This part of his work is indebted to network analysis.

Two important innovations should be singled out in Petersen's analysis of the dynamics of mobilization (or movement formation). First, he divides this process into two stages: a) from passivity to resistance and b) from resistance to rebellion. Then, he considers separately the problem of rebellion's sustainability. For each stage or problem he identifies a different set of mechanisms and shows how they mutually reinforce each other, propelling the process forward (to rebellion) or "backward" (to collaboration). Second, he relies on the concept of role—a useful though somewhat forgotten tool—to make sure that his strategizing individuals are not unnecessarily atomized and that the changing social contexts of their actions are analytically captured.

What is particularly attractive about the author's theorizing is his focus on identifying causal mechanisms (not universal causal regularities or covering laws) that 1) logically resemble the once-prized middle-range generalizations (Robert Merton) and 2) can be grouped together according to the level or domain of reality in which they operate (individual rationality, individual habits, emotional attachments, community's structure or community's culture, and so on).

Once the model is detailed, the book moves on to the presentation of ethnographic evidence. The empirical material comes primarily from Lithuania and its people's resistance and rebellions against the Soviet and Nazi occupiers. The most detailed and ethnographically rich Chapters 3 and 4 deal with the first Soviet occupation (1940–41). It is here that Petersen demonstrates the true power of his analytical apparatus. He is rightly careful to note that his empirical work in no way constitutes "an adequate test of the theory" (p. 133), but he is justified in claiming that his theoretical scaffolding is very useful in both illuminating the mechanisms of rebellion and explaining different levels of resistance and mobilization in various communities.

Chapter 5 deals with the controversial issue of "Lithuanian collaboration" with the Nazis (1941–44). Using his model and methods, Petersen shows that the claims of both extremes (all/most Lithuanians were collaborators versus all/most Lithuanians were anti-Nazi resistance fighters) are false. He provides evidence that most Lithuanians remained rather passive and uninvolved, and—more importantly—he demonstrates theoretically why it had to be so. Chapters 6 and 7 serve to test the approach in new settings that include post-World War II Lithuania, Latvia, Estonia, Ukraine, and Belarus. Montenegro during the war is also briefly discussed. Chapter 8 focuses on the perestroika period and provides further tests for various mechanisms identified and analyzed earlier. The cases include Czechoslovakia, the German Democratic Republic, and Lithuania.

Chapter 9 provides a fascinating though somewhat cursory attempt to address the puzzle of the "first actors." While an analysis of cascading mechanisms explains how people overcome various thresholds and join rebellious groups, it obviously does not say much about the leaders or "fanatics" who

decide to rebel without any "safety in numbers." Petersen admits that a single theory accounting for a first actor's actions is going to be complex and multilayered. His own contribution to such a theory is still preliminary and sketchy, but he offers several extremely promising insights and analytical clues, most of which prod us to refocus our theoretical lenses on cultural mechanisms (for example, the formation and usage of such cultural schemas as "martyrdom").

Such an ambitious and theoretically innovative work obviously has its lacunae. Briefly, here are three. First, given the theoretical ambitions of Petersen's analysis and the impressive scope of his references, it is striking that he does not often cite the voluminous literature on protest, social movements, and revolutions that has been developed by the likes of Charles Tilly, Sidney Tarrow, and many others (e.g., see Doug McAdam, John D. McCarthy, and Mayer N. Zald, eds., Comparative Perspectives on Social Movements: Political Opportunities, Mobilizing Structures, and Cultural Framings, 1996). This literature deals with many similar issues, and it would be interesting to see how Petersen sees the relationship between, say, his concept of focal points and their concept of framing. Second, although Petersen is very effective in moving beyond the unconvincing parsimony of explanations based on instrumental rationality by complementing them primarily with sociological mechanisms, his underdeveloped theorizing of cultural mechanisms comes as a surprise. It is a surprise because those mechanisms play a central role in his analysis; and, more generally, it seems that their significance is on a par with the sociological mechanisms he construes so aptly. Third, the power of his analysis resides in his careful theorizing and empirical reconstruction of mechanisms of resistance and rebellion on a microscale, in small communities. Therefore, the analysis of some of his comparative cases, approached at a more general level and without the empirical depth of his Lithuanian case, is less convincing; it is simply difficult to determine if his analysis holds or not. Those are, however, minor squabbles; Resistance and Rebellion is an immensely rewarding and inspiring work.

Civil-Military Relations in Latin America: New Analytical Perspectives. Edited by David Pion-Berlin. Chapel Hill: University of North Carolina Press, 2001. 352p. \$55.00 cloth, \$22.50 paper.

Ariel C. Armony, Colby College

As David Pion-Berlin explains in his Introduction, this collection of essays seeks to link the field of Latin American civil-military studies to major theoretical approaches in mainstream political science. Accordingly, the contributors draw from the rationalist, structuralist, and culturalist approaches in an effort to break what the editor of this book views as a long-standing isolation of Latin Americanists in general, and the region's civil-military specialists in particular, "from the major intellectual traditions, currents, and debates in political science and in the field of comparative politics" (p. 16). Therefore, the stated purpose of this volume is to reexamine civil-military relations in Latin America, taking into account major contextual changes (the wave of democratization in the region, the transition to free market economies, the end of the Cold War) and the potential contribution of mainstream analytical perspectives to new insights into this important theme in Latin American politics.

Pion-Berlin has assembled an impressive group of scholars for this project. The high quality of the chapters results in a fine collection. I am highlighting the book's achievements as well as the challenges it poses for future research with a look at five of the nine chapters.

Wendy Hunter's contribution offers an analytical exercise on the virtues and limits of rational choice models to explain the decline of military influence in Brazil. This exercise is a gem. Concepts are clearly defined and placed in the context of relevant debates in the discipline. The treatment of the Brazilian case, with a look at other Latin American countries, though necessarily brief, provides an excellent background to the conceptual discussion. More important, Hunter incisively dissects the rational choice approach as applied to the research question, showing how a failure to incorporate structure and culture may dampen the usefulness of this approach.

The chapter by J. Samuel Fitch addresses two critical questions in the study of civil-military relations in Latin America and, I would say, new democracies in general. First is the need to define standards against which the democratization of civil-military relations can be evaluated, especially if the final goal is to develop cross-national comparative work on this subject. Fitch's contribution in this respect is important, though it would have been useful to place it in the context of recent challenges to teleological notions of democratic development modeled on the paradigmatic case of well-established democracies—in plain terms, arguments in favor of measuring new democracies by their positive attributes rather than by what they lack. Second, Fitch focuses on the methodological problems of studying civil-military relations in Latin America. He gives careful consideration to such issues as selection bias and the connection between theory and empirical methods of research. This analysis serves the book's goal of closing the gap between area studies and mainstream political science, though much of Fitch's methodological discussion will sound repetitive to scholars familiar with recent debates on quantitative and qualitative methods in the field of comparative politics.

In his chapter on Argentina, Pion-Berlin untangles, from an institutional perspective, an interesting paradox: Why has the Argentine military remained subordinate to civilian authorities notwithstanding a weak and ill-prepared defense ministry? In search for an explanation, Pion-Berlin analyzes institutional differences in the Argentine state, concluding that "the institutional strengths of the Ministries of Economics and Foreign Relations and the Congress have been used to offset the weaknesses in the Ministry of Defense" (p. 147). In doing so, he shows how, in a democratic setting, the new rules of the game may allow policymakers operating within "strong" institutions with no formal authority over the armed forces to influence, effectively, the nature of the military's leverage and mission. Beyond the specific paradox addressed in the chapter, Pion-Berlin's analysis is a fine contribution to an understanding of how processes of democratization are often defined by the outcome of complex interactions among state institutions endowed with different power capacities.

Felipe Agüero's comparative chapter examines the evolving patterns of civil-military relations following the collapse of authoritarian regimes in southern Europe and South America. His thesis is that variations in civil-military relations resulted, primarily, from differences in the "founding conditions" of the new democracies, namely, "the way the military exit took place, the main features of the transition, and the early institutional arrangements that gave shape to the new postauthoritarian order" (p. 197). Bounded by specific historical-institutional conditions, Agüero explains, military and civilian actors engage in strategic interactions whose outcome would be largely determined by the opportunities and constraints defined, for each group, by the equation "access plus resources." This is a sound framework for understanding, from a comparative perspective, different outcomes in the process of achieving civilian control over the military.

In the final chapter, Brian Loveman presents an overview of the historical legacies that frame today's civil-military relations in Latin America. While there is nothing inherently innovative in this analytical perspective, the inclusion of a historical chapter keeps the editor's effort to reduce the gap between area studies and mainstream political science from resulting in a negation of the past in understanding Latin American civil-military relations. As Loveman explains in his study, "a complex set of enduring... collective expectations, beliefs, social memories, and institutionalized patterns of behavior" serves as a "subtext" of contemporary patterns of civil-military relations in the region (pp. 246, 264). One of Loveman's most interesting claims is that the authoritarian practices that permeate the political and social spheres of most of the region's democracies today cannot be attributed solely to the military regimes that emerged in the 1960s and 1970s. Military rule activated and intensified deeply embedded, long-standing institutional, political, and cultural trends in the region.

Among the few weaknesses of the book, let me mention two. The first is editorial, specifically, the unnecessary pattern by which each contributor makes an explicit reference to the editor's Introduction in the concluding section of his/her chapter. This seems to be an attempt to show the reader that all the parts fit nicely into the whole, but, in general, these comments seem artificially imposed and do not add to the cohesion of the volume, which stands by itself. The second comment is more substantive: Why do only a few of the chapters succeed in integrating the different analytical perspectives? As Hunter shows in her chapter, a particular perspective (e.g., rational choice) may have more explanatory power than other approaches to solve certain conundrums, but that does not mean that it can stand alone, disengaged from more comprehensive explanations (e.g., those which incorporate structural and cultural variables as well). In this sense, I think that Hunter's piece could have provided a useful blueprint for more elaboration in some of the other studies.

This book is a major contribution to the literature on civilmilitary relations and, in general, democratization in Latin America. It is of great value for both area specialists and comparativists. Hopefully, this volume will stimulate more collaboration among scholars working on civil-military relations in different regions, leading to a new set of studies solidly grounded in theory and broadly comparative in scope.

Welfare Capitalism in Southeast Asia: Social Security, Health and Education Policies. By M. Ramesh with Mukul G. Asher. New York: St. Martin's Press, 2000. 217p. \$65.00. Social Welfare Development in East Asia. By Kwong-leung Tang. New York: Palgrave, 2001. 214p. \$65.00 cloth.

Stephan Haggard, University of California, San Diego

The debate about the history and future of the welfare state is gradually expanding beyond the advanced industrial countries to encompass the middle-income developing countries and the formerly socialist economies of Central Europe and the former Soviet Union. This debate is particularly interesting in Asia. The newly industrializing countries in that region have had great success in increasing incomes, reducing poverty, and maintaining an equitable distribution of income. At the same time, the countries in the region are highly "globalized"—a factor often associated with increased economic insecurity—and until the 1980s were for the most part ruled by labor-repressive authoritarian regimes. By traditional measures of effort, they also appear to have surprisingly shallow public commitment to social welfare.

The emerging explanation for these apparent anomalies combines economic and political components. The region's rapid growth was labor absorbing, and as a result was accompanied by rapid expansion of employment, steadily rising real wages, and high household savings rates. Not only did such growth provide a sound basis for private and familial social insurance, it also deflected more extensive demands for government intervention. The political side of the story is a confirming mirror image of the expansion of the European welfare state. Ruled by pro-business authoritarian governments, with no left parties and with labor movements on a tight leash, these countries had little political space for welfare state politics. Where governments did devise social policies, they reflected the interests of narrow constituencies (such as the military and civil service) and favored a "regulatory" approach to welfare provision in which employers and employees, rather than the state, bore the brunt of financing welfare commitments. (The most important recent statement of this model is Roger Goodman, Gordon White, and Kwon Huk-ju, eds., The East Asian Welfare Model, 1998, and particularly the outstanding comparative essay by Kwon.) Outside of periodic political crises, when welfare commitments would expand, it took the transition to democratic rule in the 1980s and 1990s and the financial crises of 1997-98 to generate new demands for social insurance.

These two new comparative books confirm the broad outlines of this consensus, provide important amendments, but also underline that there is still much analytic and empirical work to be done on Asian social policy. M. Ramesh focuses on the five major Southeast Asian countries—Indonesia, Thailand, Malaysia, the Philippines, and Singapore—and in contrast to Kwong-Leung Tang, organizes his very systematic empirical material by policy area: social security, health, and education. His purpose is a dual one that sometimes pulls at the fabric of the book; he seeks not only to explain social policy outcomes but also to evaluate them. But as a result, his assessment of policy outcomes is richer than Tang's, which tends to be more critical.

Ramesh's focus on discrete policy areas also allows him to make an important empirical observation that needs to structure future research. While Southeast Asian countries do indeed have relatively limited commitments to social insurance, such as unemployment insurance and pensions, their commitments to basic health care and particularly education were early and comparatively expansive. Tang's book shows that the same is true of the Northeast Asian cases as well.

Ramesh argues that the provision of basic social services was a function of governments' developmental orientation. This functional line of thinking is a well-developed one in the literature on the East Asian newly industrializing countries. Just as there was an elective affinity between exportled growth strategies and labor control, so basic education and health contributed to the promotion of labor-intensive manufacturing. Yet there is little evidence provided to support this claim. Educational choices predated the relevant development policy choices, the expansion of the educational franchise appears to follow from political demands associated with decolonization, and important anomalies exist, such as Thailand, where educational attainment is surprisingly modest. Despite the often cited fact that East Asia's educational attainment was a crucial component of its success, we still have surprisingly little monographic research on the politics of education policy and reform. Why precisely did East Asia get it right? And where does the relatively paltry public commitment to health insurance fit into this picture?

In the core theoretical chapter on "The Political Economy of Social Policies"—which comes oddly at the end rather than the beginning of the book—Ramesh takes on political

issues more frontally. He argues that the expansion and maintenance of social welfare spending comes in response to calculations of political survival. The nature of these challenges varies from case to case, and Ramesh's argumentation is somewhat post hoc. Rather than identifying political challenges ex ante and testing for their effects, he examines periods of program expansion and relates them to a variety of different political challenges, which range from revolutionary movements, to labor mobilization and electoral politics. Nonetheless, the spirit of Ramesh's argument is exactly right: to look at the political dynamics behind welfare commitments.

Tang's analysis is organized by country, and it covers the "first wave" of Newly Industrializing Countries (NICs): Korea, Taiwan, Hong Kong, and Singapore. Like Ramesh's volume, it draws well on the work of local scholars, including extensive citation to the Chinese language literature. Like Ramesh, Tang also begins with a fairly exhaustive review of the full range of theories on the welfare state. Unlike Ramesh, however, Tang is more sharply focused on making a theoretical statement. Unfortunately, the nature of that statement is less well articulated than it might have been and at times marks a step backward from the more nuanced political account that Ramesh is working toward.

Tang identifies himself with the developmental state literature. In its sophisticated variants, this literature focused attention on three key features of East Asian political economy: "strong" authoritarian systems that enjoyed substantial political autonomy; relatively competent and meritocratic bureaucracies that played an important role in policy formulation; and an interventionist approach to industrial policy that supported export-oriented manufacturing. Tang notes that the first of these characteristics is clearly an important factor in understanding East Asian social policy. For example, it provides the basis for comparing Hong Kong's pro-business colonial government with the other newly industrializing countries, and it is clearly important in explaining the limited social commitments in the four cases.

Yet even in these sophisticated variants, the developmental state literature ran into trouble explaining what it was, precisely, that motivated state elites to act. Chalmers Johnson (MITI and the Japanese Miracle, 1982), was more honest than others in recognizing the problem and turned to ideology for a solution. Others, particularly Bruce Cumings ("The Origins and Development of the Northeast Asian Political Economy," in Fred Deyo ed., The Political Economy of the New Asian Industrialism, 1987) and Jung-eun Woo (Race to the Swift: State and Finance in Korean Industrialization, 1991) looked to international politics and the nature of alliance commitments. But the developmental state literature often spiraled into tautology: Developmental states pursued development, and moreover, were successful in doing so!

At times, Tang's account veers in this direction. All four countries are treated as developmental states, but the precise dimensions of the state that are germane for explaining policy-political autonomy, the bureaucracy, industrial strategy—are not clearly articulated. Rather, Tang opts for characterizations that emphasize broad political tasks and resultant policy outcomes. Singapore is a "capital investment state" [sic] that is preoccupied with nation building and in which the People's Action Party ideology plays a central role. Taiwan is a social insurance state that is driven by its competition with the mainland and fundamental survival concerns. Korea is an authoritarian-developmental state, and so on. Distinctions are not drawn between major political epochs, so clearly democratic governments are treated as developmental states no different than their predecessors. At times, this gives rise to quite fundamental confusions, as when Tang refers to the Kim Young-sam government in Korea as presiding over a "developmental-military" state (p. 110). The overall thrust of the argument is sometimes lost among a host of competing and sometimes contradictory causal factors, from the bread and butter of the European welfare state literature, such as the role of labor and the existence (or absence in this case) of social democratic parties, to Confucianism, to development strategies, to purely idiosyncratic factors.

Both of these books push the debate along, and the Ramesh study in particular provides an introduction to social policy in the region that manages to be succinct yet detailed at the same time. Tang's book also provides a good overview of his cases. Both need to be read by anyone working on the topic. But our approach to these questions needs to get back to some methodological basics. First, there is some confusion in both books about what is really being explained. What are the stylized facts? Is it the relative paucity of social commitments in Asia, the variation across policy areas, changes over time? Some of these questions may require interregional comparisons, for example, to Latin America or Central Europe. Important differences exist across countries in the region as well, despite the ongoing search for a unifying model. In some cases, we have to go back quite far in order to find the origins of those differences. In Singapore and Malaysia, for example, the origins of both the central provident fund model and public health care can be traced to the British, while the Philippine welfare system is imitative of the United States. The effects of both democratization and economic crises, to which the region was subjected in 1997-98, provide opportunities to link this literature both with other regions and with the debate on globalization.

Despite the progress engendered in these two works, there is clearly a lot of room for intellectual arbitrage between the ongoing work on the welfare state in Europe and what is emerging in developing countries.

**The Politics of Daycare in Britain.** By Vicky Randall. Oxford: Oxford University Press, 2001. 232p. \$65.00.

Greg McCarthy, University of Adelaide

This illuminating account of child day-care policies and practice in Britain casts a dark shadow over equality in that country. Through the exploration of the simple question of why the public provision of child care has been so meager in Britain, Vicky Randall presents a compelling account not just of policy failure but of a general disinterest in child care as an equal opportunity issue. For her, there are intrinsic flaws in British society that have hindered the provision and funding of public child care in that country. The reason for this systemic inequality is to be found, principally, in the British brand of liberalism, combined with the country's institutional structures, both of which have operated from the premise that child care is a private concern.

To explore her hypothesis, Randall uses a combination of feminist insights and neoinstitutionalist thought to explore the peculiarity of the British approach to child care. In regard to feminism, Randall applies Bob Connell's notion of a "gender regime" to explore how issues relevant to women are lowly placed in the policy hierarchy (R. W. Connell, "The State, Gender, and Sexual Politics," *Theory and Society* 19 [1990]: 507–44). She uses this method to investigate the British state, which she depicts as embodying assumptions and practices that militated against child-care reform. When child care did appear on the policy agenda, it was always made subordinate to other policy concerns, with the underlying assumption being that it was a family matter. Even the marked expansion of day nurseries and child care during World War II

was quickly abandoned at the onset of peace, if for no other reason than to quell the desire of mothers to supplement their income (p. 45). Randall notes that what was remarkable about the 1950s and 1960s, despite rising demand for public child care by mothers, was a notable lack of recognition of child care as a policy issue by any government. The cause of this blindness was, in no small part, due to the absence of child-care advocates, even from the feminist movement. Rather, child care became an issue for mothers to negotiate themselves through such means as child minders, day care, play groups, nannies, or the various nursery arrangements.

Randall argues that this lacuna is a symptom of the form of liberalism dominant in Britain, which unquestioningly excludes mothers from its notions of individual choice. She ties this philosophical weakness to the character of the British state, arguing that what was notable about the British public sector was its disinterest in child care. The public provision of child care, in its multiple forms, was divided between two basic institutions; for the "under threes," it was the Department of Health, and for the "over threes," it was the Department of Education. Both institutions competed to capture the preschool agenda but did very little with it, once it was under their control. For Randall, this was not just a case of non-decision making spread over two decades but also an articulation of a patriarchal ideology, which remained unchallenged whether Conservatives or Labour were in power. When child-care problems did arise on the political agenda, these institutions shifted the onus onto one another or to some other body (often local government), which was ill resourced to deal with the issue.

In a quite ingenious manner, Randall then notes that in each of the moves between governments, there is a certain tragicomedy about the politics of child care in Britain. For instance, in the mid-1970s just when child care was finding political voice and agency through the women's movement, trade unions, and the Left of the Labour Party, it was swept aside by Thatcher's neoliberal agenda. The Thatcher revolution with its pro-family focus and rhetoric of small government stifled the demand for public child care. Under a wide-ranging assault, the women's movement went on the defensive, resisting government attacks on equal opportunity, the right to choose, and other inspirational political issues, but at the expense of child-care reform. Moreover, the childcare lobby groups were fragmented and divided in their response to the government's contradictory agenda. Ironically, the Thatcher revolution proved positive for child care in that it destabilized Whitehall's staid incrementalism. As a consequence, the child-care agenda became more open to change from both inside and outside the bureaucracy.

Under John Major, this open agenda took a particular, if not borrowed, form. Following the United States, the issue of child care was linked to the supposed moral problem of lone mothers and the need for employment programs to break their economic dependency on welfare. To suppress the alleged appeal of social security benefits, single mothers were encouraged (pressured) to use child care as a means by which they could enter the workforce. Notwithstanding the ideological premise on which this moral anxiety was built, it did at least raise the economic link between motherhood and choice. It was this link that Tony Blair made part of his 1997 election manifesto, where child care was given a high priority as a part of his program for modernizing the British welfare state (p. 188). Nevertheless, Randall is somewhat skeptical of the Blair reforms, which she sees as big on rhetoric but short on substance.

To reinforce the argument that Britain was a laggard nation in regard to child care, Randall presents a cross-country comparison of child-care policies, in which she compares Britain against Australia, Canada, New Zealand, the United States, Sweden, West Germany, and France. The comparison is conducted at a variety of levels, including an examination of the dominant ideologies of the respective countries and the provisions of child care and primary education, to the place of women in society, and to the overall policy agendas and institutions of the countries under examination. Randall concludes that the best explanation for the differences in child-care provisions is to be found in the linkages among philosophy, policy legacies, and institutional frameworks.

Although this book is a tour de force, it is important to note a few minor quibbles about its methodology and approach. While the analysis is aware of discourse theory, it is remiss that Michael Foucault's perspective on discourse is not discussed, as it would have reinforced the book's arguments on institutional impediments to change. Similarly, while the historic account is replete with cultural references, these are not related to any cultural theory per se. Such an awareness would have assisted in the explanation of the dominance of the male breadwinner model in Britain and of the attraction of feminists to media-grabbing issues, rather than motherhood and child care. Finally, the cross-country analysis contained some minor errors; it was Bob (not Bill) Hawke who led the Australian Labor (not Labour) party in 1983, and who oversaw the expansion of child-care funding, which in the end came at the expense of the community-based childcare sector.

In sum, this book is an outstanding achievement, dealing with a much-neglected subject, revealing how the provision of child care offers an exemplary case study not just of institutional and governmental politics but also of the detrimental affects of the combination of liberalism and patriarchy. Last but not least, the analysis is an adroit critique of public policy theory, with Randall taking to task traditional institutional analysis, network and community theory, and various policy typology models, showing how all fail to explain the peculiarity of child-care policy in Britain.

The Tragedy of Russia's Reforms: Market Bolshevism Against Democracy. By Peter Reddaway and Dmitri Glinski. Washington, DC: United States Institute of Peace Press, 2001. 768p. \$55.00 cloth, \$29.95 paper.

Darrell Slider, University of South Florida

The fate of Russia's economic and political reforms is the subject of this interpretative history of the last years of the Soviet Union and the Yeltsin period, The book provides a useful, if controversial, introduction to the events of this crucial period in Russian political development, from 1990 to 1999. Special attention is given to the events surrounding important turning points in Russian history; there are particularly detailed treatments of the August 1991 coup, the collapse of the Soviet Union, and Boris Yeltsin's forcible disbanding of the parliament in October 1993. In the end, though, the large number of events the authors seek to analyze is a liability because it tends to detract from and dilute the main argument.

That argument is centered on the critical decisions made in 1991–92 about economic reform and its accompanying political strategy. Peter Reddaway and Dmitri Glinski offer an insightful analysis of the choice of reform strategy and the impact this had on subsequent developments. The consequences are not in dispute: hyperinflation in the early years, a depression-like decline in Russian output, the impoverishment of the nascent Soviet middle class, the appearance of big-business "oligarchs" and mafia groupings, the rise to economic dominance of the communist-era nomenklatura, rampant corruption, popular disenchantment with politics and

a decline in civic activism, and a breakdown of the socialsupport mechanisms that had been one of the strengths of the Soviet system.

The blame for this turn of events is placed primarily on Yeltsin and his chief political and economic advisers. Western leaders, the International Monetary Fund, and particularly Western economists are also accused of encouraging Russian leaders to follow an inhumane set of policies. The overall reform strategy, generally in line with what has come to be known as the Washington Consensus or "shock therapy," emphasized monetarist approaches, price deregulation, rapid privatization of industry, and the end of government-provided subsidies and social safety nets. One of the most important contributions of the book is its explication of the behind-the-scenes political maneuvering that produced the reform strategy. Especially useful are the insights on the various protoparties and political movements that struggled to establish a political foothold in the chaotic developments of the period. Reddaway and Glinski coin the term "market bolshevism" to describe the political mindset of the winners—the political figures such as Anatoly Chubais who implemented shock therapy—a disregard for public opinion and a manipulative approach that manufactured mass support only when absolutely necessary, as during Yeltsin's bid for reelection in 1996.

This is a book that provides an overabundance of detail, and almost no evidence relevant to its main thesis is overlooked. Some of the evidence that contradicts the thesis is perhaps dismissed too readily, however. The authors view the period of shock therapy as having lasted seven years, rejecting arguments by reform defenders that the Yeltsin government quickly backtracked and that compromises made because of political weakness undermined the foundations of many of the reforms. Instead, Reddaway and Glinski present this "seesaw" approach as the intended strategy. Further, a number of phenomena—such as the rise of criminal mafias—that were presumably unanticipated consequences of the policy choices made are presented as if they were part and parcel of the reformers' strategy.

The authors present alternative paths as real options, although they seem beyond what was possible in Russia at the end of the 1980s, beginning of the 1990s. Popular discontent a "grassroots anti-nomenklatura upsurge" (p. 253)—that supposedly could have been mobilized into a movement in support of another kind of reform did not appear to have the kind of usable potential that the authors suggest. In order to tap this presumed source of support, the authors argue that Yeltsin should have relied more on the nascent democratic movement. In particular, they favor the nationaldemocratic wing, such political figures as Sergei Baburin and Oleg Rumiantsev. In the early 1990s, these figures were marginalized politically, and they joined the opposition that conspired to seize power in October 1993. Reddaway and Glinski also side with opposition economists such as Sergei Glaziev, who has long advocated an economic strategy based on government support of key industries and strong social programs for the victims of reforms.

There is an unfortunate tendency in some of the analysis to relay as evidence conjecture and conspiracy theories that figure so prominently in the Russian media. For example, the shortages of consumer goods in the late Soviet period are viewed not as evidence of the collapse of the previous system but as a pressure tactic by wholesale traders to wrest control from the state over this sector. In discussing the events of October 1993, when the anti-Yeltsin opposition in parliament launched a violent attempt to seize the mayor's office, television facilities, and other centers of power, the authors use speculative and dubious accounts to suggest that the violence

was deliberately facilitated by Yeltsin's security forces. The goal was to justify the later use of tanks against the parliament in support of Yeltsin's ultimate purpose, "the destruction of Russia's parliamentarism for the sake of increasing his personal power" (p. 429). The authors find it plausible that the 1999 incursion by Chechen rebels in Dagestan was provoked by the Russian security forces (headed at the time by Vladimir Putin) in order to provide an excuse to start a new war in Chechnya.

Overall, though, despite its weaknesses and occasional lapses, Reddaway and Glinski's account provides an extraordinary wealth of information on the twists and turns of Russian politics during this formative period.

Democracy in Divided Societies: Electoral Engineering for Conflict Management. By Benjamin Reilly. Cambridge: Cambridge University Press, 2001. 232p. \$60.00 cloth, \$22.00 paper.

Shaheen Mozaffar, Bridgewater State College

Benjamin Reilly makes an important contribution to the debate on the appropriate institutional design of electoral systems for mitigating conflict and sustaining democracy in ethnically plural societies. The dominant position in this debate posits the importance of proportional representation (PR) systems. An alternative position, less widely accepted largely because of an ostensible absence of empirical examples, posits the importance of majoritarian preferential systems that encourage cross-ethnic vote pooling. Reilly extends this debate by drawing on heretofore unknown or understudied cases to examine the operation of both majoritarian (the alternative vote or AV and the supplementary vote or SV) and proportional (single-transferable vote or STV) preferential systems in different social contexts and in different elections (legislative and presidential).

The book's central argument is that, unlike the elite-based PR systems, preferential systems privilege the decisions of voters as the source of cross-ethnic vote swapping, forcing otherwise rational candidates to forgo ethnic outbidding in favor of seeking votes across ethnic cleavages. The argument turns on the notion of "centripetalism," which, for Reilly, refers to a "normative theory of institutional design" that seeks to 1) create electoral incentives for politicians to campaign for votes across ethnic cleavages, 2) establish arenas of bargaining for ethnic elites to transfer the lessons from electoral bargains to other political issues, and 3) foster centrist and aggregative multiethnic political parties instead of extremist and exclusively ethnic ones (p. 11).

Eschewing systematic theory testing, Reilly uses this normative theory as a loose framework to evaluate the performance of preferential systems in all cases (except Malta) that are known to have utilized them. Bracketing the case studies are an informative overview of the development of preferential voting systems from their origins in attempts in the nineteenth century to overcome the intrinsic weaknesses of majority runoff elections (Chapter 2) and a useful discussion of the technical variations in the institutional designs of such systems that also highlights the unexpected consequences of minor technical modifications in institutional design (Chapter 7).

The book's initial focus on Australia is useful, and not only because it has developed and refined all variants of preferential systems in national and subnational elections for almost a century. As an ethnically diverse but not an ethnically divided society (p. 25), it also serves as a controlled case for illustrating the advantages of preferential systems in achieving the three centripetal objectives. The fascinating case of Papua

New Guinea provides the clearest and strongest support for AV. One of the world's most ethnically fragmented societies, Papua New Guinea used AV in three elections between 1964 and 1972 to mitigate conflicts through cross-ethnic vote swapping negotiated by candidates who campaigned together among each other's ethnic groups, seeking second-preference votes on the correct calculation that rational voters would give their first preference to candidates from their own ethnic groups. The adoption of "first past the post" (FPTP) after independence in 1975 reinforced the advantage of AV, as the new FPTP system created severe cross-ethnic coordination problems, encouraging the entry of large numbers of candidates, with corresponding decline in winning vote ratios and increase in election-induced ethnic violence. The 1998 assembly election in Northern Ireland, held under the terms of the Good Friday Agreement, provides the clearest and strongest support for STV. In that election, STV helped, through vote transfers, to neutralize extremist sectarian parties and elect pro-agreement, centrist parties from each side of the otherwise deeply divided ethnic cleavages.

Fiji and Sri Lanka, however, provide weak support for the claimed effectiveness of preferential designs. In Fiji, where indigenous Fijians and Indo-Fijians have roughly equal population ratios but are otherwise ethnically, economically, and politically divided, the use of a partially engineered AV system in one parliamentary election produced limited preelectoral cross-ethnic vote-swapping agreements among erstwhile "monoethnic" parties. But the election results un-dercut even these limited agreements. In Sri Lanka, the use of SV in four presidential elections between 1982 and 1999 failed to counteract the overwhelming Sinhalese population advantage (74%) over Tamils (18%) and Muslims (7%), leading always to the election of Sinhalese candidates by an absolute majority of first-preference votes. A number of factors related to contextual variations and technical modifications in institutional design are adduced in an ad hoc manner to account for these differences between institutional expectations and electoral outcomes.

Beyond these major cases, the book also contains brief, informative discussions of the failed attempts to adopt AV in the United Kingdom, the one-time use of STV in Estonia's transitional election in 1990, the potential advantage of AV in the election of Bosnia-Herzegovina's tripartite presidency (an option that was considered but not implemented for the presidential elections there in October 2002), and the use of various preferential systems in several subnational elections in the United States and Canada.

The book does not systematically account for the mixed results from the major cases, exposing the analytical weakness of the "electoral engineering" approach. For instance, perhaps the most important insight of the book, which is found only in the last few pages (pp. 185–192), concerns the significance of two aspects of ethnic group demographics—fragmentation and concentration—in mediating the expected impact of preferential designs. With respect to fragmentation, ethnically heterogeneous districts are considered to be "the single most important demographic precondition for centripetal strategies to work effectively" (p. 185). Group concentration, on the other hand, creates ethnically homogeneous electoral districts, rendering the use of vote pooling highly problematic.

Reilly wisely uses these demographic variations to caution against a cookie-cutter approach to electoral engineering. Curiously, however, he does not systematically examine the implications of these variations in the case studies, even though ethnically heterogeneous districts are commonplace in Papua New Guinea and ethnically concentrated districts presumably exist in Northern Ireland, the two cases that pro-

vide unambiguous support for preferential systems. Also left unexamined is the failure of AV to produce the expected results in Fiji, where the ethnic group demographic (dispersion and geographic intermixing) is also considered favorable for the effectiveness of the design (p. 187). Examination of these issues requires a more rigorous analytical approach than allowed by the normative electoral engineering approach. It especially requires the use of quantitative techniques such as regression analysis to clarify the independent, additive, and interactive effects of institutional design and context on electoral outcomes. The two approaches, however, are not mutually exclusive. Quantitative analysis provides the systematic knowledge and understanding of the relative effects of institution and context that are necessary for realizing the prescriptive aspirations of the electoral engineering approach.

Reilly's book, therefore, does not close the debate on the appropriate institutional design of electoral systems for managing ethnic conflicts. But its coherent and convincing arguments in favor of preferential systems, and especially its coverage of heretofore unfamiliar and understudied cases that have employed them, advance and enrich it.

Political Legitimacy in Middle Africa: Father, Family, Food. By Michael G. Schatzberg. Bloomington: Indiana University Press, 2001. 292p. \$49.95 cloth, \$22.95 paper.

Robert Fatton, Jr., University of Virginia

Political Legitimacy in Middle Africa is an insightful, refreshing, and original book that refines and expands our understanding of the so-called "politics of the belly." A phrase made famous by Jean Francois Bayart (The State in Africa: The Politics of the Belly, 1993), the politics of the belly is the phenomenon of "eating" the fruits of power. The extent to which officeholders monopolize or share these fruits with the larger community has, however, significant consequences for their legitimacy. As Michael Schatzberg suggests, a "moral matrix of legitimate governance" (p. 35) embedded in familial and paternal metaphors shapes these belly politics. In turn, he argues that the moral matrix is rooted in four major premises. The first and second are related to the image of the ruler as a "fatherchief," who has the obligation, on the one hand, to nurture and nourish his "family," and on the other hand, to punish his "children" when necessary and pardon them when they truly repent. The third premise concerns the status of women in society; while they are not considered equal to men, rulers should, nonetheless, respect their role as "counselors and advisers." The fourth premise "holds that permanent power is illegitimate and that political fathers... have to let their children grow up, mature, take on ever-increasing responsibilities in the conduct of their own affairs, and eventually succeed them in power" (p. 192).

Governments that respect these four moral premises are not necessarily democratic, but they enjoy legitimacy and thus will endure; neither the ballot nor the bullet is likely to overthrow them. When the "father-chief" "eats" within limits and guarantees his "family" access to food, while both knowing that his power is not eternal and listening to his "wives" and "daughters," he will win popular support. To that extent, Africans will be satisfied with a regime that responds to their own norms of accountability and legitimacy. These norms correspond to what Schatzberg calls "thinkability." Thinkability is not simply "that which is politically thinkable" but is also, in Schatzberg's eyes, legitimacy itself. Moreover, the author contends, legitimacy can be apprehended through an exhaustive study of the "mainstream political discourse" (p. 32).

Political Legitimacy in Middle Africa seeks to uncover this discourse by systematically examining daily state newspapers,

weekly magazines, primary documents, presidential speeches, and church and political documents of eight African nations—Senegal, Nigeria, Ivory Coast, Ghana, Cameroon, Congo/Zaire, Kenya, and Tanzania. In Schatzberg's view, this exploration leads to an understanding of what is and is not thinkable in Middle Africa; it provides the area's moral matrix of governance. In this sense, the book revives the neglected study of the role of ideas and language in the making and unmaking of regimes. It reemphasizes the significance of political culture as a lens that can illuminate the social land-scape. While the author argues for the specificity of historical circumstances and their decisive impact on the formation of moral matrixes, he does not claim that Middle Africa is unique.

In fact, Schatzberg contends that all societies have moral matrixes, but the substance and significance of their constituent elements vary depending on their respective histories. So, for instance, the metaphors of the ruler as "father" and society as a "family" are widespread in both industrial and developing nations. What differs, however, is their ideological pervasiveness; in other words, what is thinkable in one place may not be thinkable in another. Thus, people operate under diverse sorts of hegemonies and explain their world with distinct logics. As the author puts it: "Depending on time, place, and context, it is quite conceivable that some societies will share certain premises of a matrix while not sharing others" (p. 32).

Moreover, Middle Africans use their own specific means of understanding and shaping their existential conditions. Like any other people, they avail themselves of multiple methods to influence events and ultimately believe in different and indeed contradictory modes of causality. Depending on circumstances and objectives, they may resort to modern "rational" science while simultaneously appealing to the powers of the occult and sorcery. Middle Africans are certainly not the only ones making use of these multiple and often inconsistent forms of explaining and shaping social reality. As Schatzberg points out correctly: "Reliance on alternative understandings of causality may be quite universal" (p. 205). After all, under Ronald Reagan's presidency, astrology played a decisive role in the day-to-day running of the White House (p. 116).

Thus, Schatzberg is fully cognizant that certain basic political phenomena transcend place and time, but he warns us against assuming the universality of basic Western theoretical concepts. While one can compare and generalize, it is crucial to elucidate that which is historically specific. The conventional assumptions of American political scientists about the separation of church and state, and state and civil society, simply do not hold in Middle Africa. There, the parameters of politics derived from the Western experience are only partially, if at all, duplicated. According to Schatzberg, it becomes exceedingly difficult to draw neat analytical boundaries around politics, religion, sport, and labor because Middle Africa's governability is rooted in the ubiquity of paternal and familial forms.

This book is therefore a formidable challenge to the prevailing conventional wisdom; it shows the limits of current and dominant paradigms on democratization and civil society. It reestablishes the centrality and primacy of legitimacy as the critical "first step" in the establishment of any accountable regime. "Democratic" constitutions may be codified, elections may be free and fair, but they do not suffice; they are empty shells without the substance of legitimacy.

Political Legitimacy in Middle Africa is thus a major point of departure. One may wonder, however, whether Schatzberg's dependence on the "mainstream political discourse" to define "thinkability" and indeed legitimacy does not silence the hidden voices of subaltern groups and classes.

In other words, Schatzberg's moral matrix privileges what James C. Scott (*Domination and the Arts of Resistance*, 1990) has termed the "public transcript," that is, the common wisdom of rulers and dominant classes, and neglects the "hidden transcript" of the victims of power. A full understanding of the moral matrix of governance requires, therefore, a systematic study of "infrapolitics," the rather opaque and "unobtrusive realm of political struggle."

Schatzberg has written an important volume that will become indispensable to understanding contemporary African politics. While one may quibble with the author over particular interpretations, there is little doubt that this is a major book. Rich in detail, subtle in its investigation, and broad ranging in its theoretical and comparative scope, the book addresses challenging questions and provides provocative answers. It is essential reading for any serious student of comparative politics.

The Outsider: Prejudice and Politics in Italy. By Paul M. Sniderman, Pierangelo Peri, Rui J. P. de Figueiredo, Jr., and Thomas Piazza. Princeton: Princeton University Press, 2000. 218p. \$29.95.

## Harlan Koff, Duke University

The Outsider is a study of prejudicial attitudes toward migrants in Italy. The book contributes to the study of public reactions to non-European Union immigration because it statistically analyzes opinions that are usually addressed descriptively. Moreover, the work correctly studies the interaction between individual and social responses to migration. However, the overall contribution of this book to the comparative literature on xenophobia in Europe is limited by serious theoretical and methodological flaws.

The authors of *The Outsider* begin with two research questions: 1) Does race hold distinctive status in marking others as outsiders? and 2) What is the relationship between the psychological roots of prejudice and group competition for resources? In order to carry out these tasks, a telephone survey, including 4,558 interviews, was conducted to ascertain opinions regarding non-EU nationals as well as the North-South divide, which is a major characteristic of the Italian political culture. This latter aspect of the survey was utilized as a means for comparing group categorization in Italy and formulating a general theory of prejudice.

The authors constructed this survey on the incorrect assumption (which they admit) that race is the fundamental element of prejudice. They expected to find that "All, because they are immigrants, will bear the burden of intolerance, but those who are black, by virtue of being black, must bear a heavier burden still" (p. 15). This notion has been refuted in the recent literature on xenophobia in Europe (e.g., see Michel Wieviorka, *The Arenas of Racism*, 1995).

The authors show that intolerance to immigrants is prevalent within mainstream Italian society. Statistical analysis illustrates a reluctance to make positive remarks about migrants and a readiness to make negative ones. However, even though many of those interviewed demonstrated a willingness to criticize immigrants, the number of participants who agreed that migrants are "by nature inferior" was limited to 15%. The authors accurately argue that the interpretation of this result is open to discussion due to contemporary institutional and normative contexts. Nonetheless, it does show that classical discussions of racial superiority are not the most significant basis of prejudicial attitudes within Italian society. This refutes the study's initial hypothesis. The authors also questioned participants on their views regarding distinct racial categories, defined as "North African," "Central

African," and "East European." Their tables, which compare responses based on descriptive statistics and factor analysis, clearly indicate that race does not affect intolerance. In fact, the group most harshly judged in the survey was the East European category. This confirms the results of numerous qualitative studies that have stated that Albanians and Gypsies are the most ostracized ethnic groups in Italy.

Another strength of this study is the proposed definition of prejudice. According to the authors, "Definitions are tools. In gauging their value, the crucial question to ask is not about their validity but their utility" (p. 19). They base their definition of prejudice on the concept of consistency: "The more consistently one attributes negative characteristics, or alternatively, declines to attribute positive characteristics to a group, the more prejudiced he or she is" (p. 25). This definition allows the authors to create a scale of prejudice and evaluate whether intolerance is a mainstream or marginal value in Italy.

The authors also examine the roots of Italian intolerance through what they call "the Two Flavors approach." This combines both the inherent psychological roots of prejudice, which are proposed in normative studies, and the rational roots of conflict based on material competition (e.g., see Donald Horowitz, *Ethnic Groups in Conflict*, 1985, for descriptions of both approaches). While statistical tests do not completely validate the Two Flavors approach, the authors correctly argue that research on prejudice should not be marked by a clash of these competing perspectives. By attempting to reconcile them, the authors open an interesting avenue for future research on the relationship of these factors.

Despite these strengths, there are numerous concerns that detract from the book's overall contribution to the study of intolerance. The first regards analysis of the Italian case. Even though the authors correctly identify regional differences as a fundamental trait of Italian political culture, they utilize the state as the unit of analysis. Recent studies of public reactions to migration in Italy have shown significant variance between attitudes in the North, Center, and South (e.g., see Fondazione Nord-Est, *Immigrazione e cittadinanza in Europa*, in *Migrazioni: Scenari per il XXI secolo*, 2000, and Censis, *Le Paure degli Italiani*, 2001). Given socioeconomic and cultural divergences that exist at the regional level, this variance is fundamental to understanding the relationship between normative and rational roots of intolerance.

In addition, the ability to generalize the results of this research project is limited because Italy is hardly a critical case among European countries. It does satisfy the two conditions presented by the authors regarding the study of intolerance: the significant presence of prejudicial attitudes and at least one radical right party. However, given the declared objective of analyzing the role of race in the formation of prejudicial attitudes in contemporary Europe, the choice of Italy does not seem logical. Unlike France, Britain, Spain, Belgium, and so on, colonialism was never a major factor in the formation of public attitudes regarding immigrants. This element of historical development must be considered because it is so closely linked to psychological notions of racial superiority. In this sense, Italy is an outlier rather than a typical case.

Finally, the authors analyze the impact of intolerance on contemporary Italian party politics. They correctly argue that migration has become a salient issue that has contributed to the success of right-wing parties. The discussion of public attitudes and institutions, though, remains incomplete. There is no mention of mechanisms that fundamentally impact the formation of public views regarding migrant groups. Parties do not merely reflect intolerant positions; they also contribute to their formation. Moreover, many scholars have studied

the negative coverage that most Italian newspapers give to migration issues. Such mechanisms (e.g., media) need to be discussed in any study of public responses to migration. For these reasons, *The Outsider* addresses many questions regarding the nature of European prejudice and intolerance, but the answers it provides are incomplete.

Environmental Leadership in Developing Countries: Transnational Relations and Biodiversity Policy in Costa Rica and Bolivia. By Paul F. Steinberg. Cambridge, MA: MIT Press, 2001. 280p. \$65.00 cloth, \$24.95 paper.

Pamela Stricker, California State University, San Marcos

Much of the literature on environmental policymaking in the Global South focuses on the role of transnational linkages, wherein ideas regarding environmental management are transplanted by intergovernmental organizations and nongovernmental organizations in the North to governments in the South. The perception that environmental management concepts are primarily transferred in this way stems in part from the resonance that Ronald Inglehart's work on postmaterialist societies and environmental activism has had on the field, as well as a paucity of studies examining the dynamics of the domestic political players in the creation of natural resource management policies in the South. Paul Steinberg's work, Environmental Leadership in Developing Countries, addresses this particular puzzle and takes on the too-oft accepted notion that domestic policy entrepreneurs play a small supporting role at best in bringing about environmental policies in the Global South.

Using a most different comparative case study based on participant interviews, archival research, and content analysis of leading Costa Rican and Bolivian newspapers, Steinberg reveals the efforts of such domestic players in the development of policy cultures around environmental ideas that impact the creation of conservation policies. He introduces the concept of bilateral activists to describe how activists seamlessly transcend borders and settings, moving freely between national and international meetings, speaking multiple languages, relying on knowledge of policy-making processes and international assistance programs, and possessing the talent to create and nurture professional, political, and financial relationships with potential allies abroad. These bilateral activists emerge at the intersection of John Kingdon's policy entrepreneurs and Peter Haas's epistemic communities working within E. E. Schattschneider's ideational context, armed with the political savvy to leap over domestic political landmines and in through windows of opportunity.

As the responsibility for solving domestic environmental problems falls largely within the realm of the nation-state, Steinberg's work directly takes on the premise that given the often crushing weight of poverty and foreign debt, most nations of the Global South opt to utilize the natural resource base in order to attempt to provide for their population's needs, as well as to create goods for sale in the global market, rather than engage in debates over environmental conservation. Steinberg draws upon polls conducted by Riley Dunlap and Gallup (1993) as well as Lewis Harris, which demonstrate that peoples from the Global South have high levels of concern about the environment, to situate his argument on the two cases. Further, when compared with per capita levels of GNP, environmental concern is ranked higher by peoples from poor countries than those in industrialized nations in 8 of 11 measures (p. 37). This finding was repeated in another poll (Kidd and Lee, 1997), which found that peoples in poorer countries were also more willing to pay

(via income or increased taxes) to prevent pollution than were their compatriots in the more affluent industrialized world (p. 40).

From these findings, Steinberg delves into the content analysis on both nations to establish whether this ideational component shaped the policy culture within which these bilateral activists could work. Both Costa Rican and Bolivians citizens first embraced what he terms "proto-environmental" attitudes in response to questions of national sovereignty as opposed to foreign control of the nation's natural resource base (p. 105).

To make his point on the efficaciousness of bilateral activists, Steinberg takes the reader through four aspects of domestic resources: political learning, agenda setting resources, networks of social influence, and process expertise. He succeeds quite nicely by demonstrating in the Costa Rican case that government officials set the environmental policy agenda that in turn spurred a groundswell of green sentiment from the populace. In the Bolivian case, we see the policy come about in a different order; environmental nongovernmental organizations set the environmental agenda, defining issues and setting forth priorities, which later would be addressed by government. In the process, however, some activists, such as Bolivian naturalist Noel Kempff, lost their lives fighting to preserve the natural world.

But not all activists were included in the dialogue in Bolivia. Indigenous peoples, typically marginalized by political and economic elites, were left out of initial environmental protection debates; later, common ground was forged by environmental activists and the indigenous peoples when the latter began linking self-determination arguments to environmental concerns (pp. 115-16). Steinberg's discussion of the development of Thomas Lovejoy's debt-for-nature swaps in Bolivia is another reason this text is quite useful for comparative environmental policy seminars. While details of Costa Rica's environmental history are generally more widely known, the chapter is still quite fresh with segments on former President José María Figueres's announcement that sustainable development would guide his environmental policy and on the complicated stories of national park development.

The only shortcoming in the text is a small unanswered question. Steinberg says he chose his cases on the basis of temporal variability on policy outcomes (within the most-different-systems approach), yet he does not fully explain why the outcome—policy changes—occurred in a different order. Perhaps it is linked to features within the different systems, but he does not say so.

Yet despite that small shortcoming, which arguably is a difficult question to answer, the final outcome was quite similar and the results do show that in both cases, bilateral activists play an exceedingly (and in the literature, quite overlooked) significant role. Further, he has done a wonderful job of reconstructing how these policy cultures developed in the nations and how these policy activists were able to foster the creation of such policies. In doing so, he makes an important contribution to the literature in comparative environmental policymaking. The text also analyzes environmental policy successes (in contrast to failures), which have been understudied in both comparative politics and comparative policymaking. Through this work, Steinberg has clearly laid to rest the somewhat condescending notion that only policy entrepreneurs from the environmentally privileged North can "help" nations of the Global South to protect their natural resource base and demonstrated that poverty does not necessarily cloud one's desire to preserve the natural world.

Abortion Politics, Women's Movements and the Democratic State: A Comparative Study of State Feminism. Edited by Dorothy McBride Stetson. Oxford: Oxford University Press, 2001. 380p. \$72.00 cloth, \$24.95 paper.

Sheila Shaver, University of New South Wales

This book deals with the politics of abortion and abortion law reform as they have developed in 11 countries of Western Europe and North America during the period of the women's movement's second wave. The stories that are told vary a good deal, even among countries apparently similar in religious composition, political tradition, and legal culture. They include the early and comparatively uncontroversial move to allow abortion on grounds of the mother's physical or mental health in Great Britain, more radical reform in the Netherlands making early abortion available on demand, and the continuing division in Ireland where judicial affirmation of a woman's right to travel outside the country must be counted a win. It is an interesting and worthwhile book for this alone.

The primary focus of the book is not, however, on abortion per se but on the political forces and relations shaping abortion law reform. Dorothy McBride Stetson and her colleagues are interested in the contribution of "state feminism"—women's policy units established within the state—to the achievement of the women's movement goals, and the conditions under which feminists working "inside" the state can have greatest effect. Abortion serves here as empirical material for a systematic exercise in theory construction and hypothesis testing. The book is a formidable achievement in these terms. It is empirically detailed, methodologically rigorous, and fruitful in informing social movement theory.

The study is part of a larger project, in which Stetson's Comparative State Feminism (edited with Amy Mazur, 1995), focusing on equal opportunity policy, was the first installment. It is to be one of three studies of women's policy areas, the others focusing on job training (State Feminism, Women's Movements, and Job Training Policy in the Global Economy, Amy Mazur, ed., 2001) and on prostitution and traffic in women. As such, the 11 country studies making up the present volume have been conducted on a standardized template framed for the purposes of the overarching theoretical inquiry. The countries included in the project represent most of Western Europe, though unfortunately not Scandinavia or Finland, and North America; their representation of advanced industrial democracies is weakened by not including Japan or Australasia.

The first chapter sets out the framework structuring the national studies and defines variables that are used. The comparative strategy underlying the research design relies less on the comparison of countries than on political issues and decisions, with the author of each national study selecting three specific debates as representative of the political decision-making arenas and decisive events in the history of abortion politics over the period. This temporal element gives the research a longitudinal dimension, enabling it to track the succession of political events and the rise and waning of women's movements in each country. As a result, there are 32 "debates" in national sequences of three (only two were included in the case of Spain). For each debate, authors discuss and classify the characteristics of the women's movement and its impact, women's policy agencies, the framing of the debate, policy outcomes, and the characteristics of the policy environment.

The final chapter addresses the meaning and character of these debates in terms of five hypotheses: 1) that women's movements have been successful both in influencing the content of policy and in gaining participation in policymaking processes; 2) that these movements have been more successful where women's policy agencies have acted as insiders in the policymaking process; 3) that the resources and institutional capacity available to women's policy agencies matter for their ability to link women's movements and policymakers; 4) that the characteristics of the women's movement and policy environments matter; and 5) that equally effective linkages between women's movements and state responses will not be made in the absence of women's policy agencies.

The evidence is more conclusive on some points than others. Generally, it is suggested that women's movements were successful in more instances than not, with that success growing as the abortion issue itself continued in debate. Such success was greater where women's policy agencies had been able to act as an insider in the policymaking process, and was lesser in those cases where agencies had only a symbolic presence. In general, women's policy agencies tended to be remote from power and low in resources. The nature of their mandate appears to matter more directly than resources in their capacity to confer insider status on women's movement forces. The most important aspect of the women's movement in gaining insider status was its closeness to left-wing parties and the political strength of those parties. The unity of the women's movement and the priority it gave to the abortion issue were also very important. Except in closed policy environments, women's policy agencies do appear to be necessary to the movement's success in influencing the content of policy and gaining participation in policymaking processes.

These findings are of considerable interest and significance. I was disappointed, then, that the book does not do more to situate and develop them in the social movement and policy literatures. The inquiry itself is not situated by means of a literature review, and its findings are not put in context with respect to social movement theory or the findings of other empirical studies. As a result, the book reports the conduct and findings of a rigorous empirical study, but treats the implications of this inquiry for its own and related fields as self-evident.

The tight focus of the book leaves little room for exploring a range of other issues about abortion access and the politics of abortion law reform. A number of such issues are threaded through its pages and the national political histories they contain. One of these is the gap between formal access to abortion and the effectiveness of access in the face of economic, institutional, and other barriers. The 11 country accounts show considerable variety in the accessibility of abortion services and the institutional route a woman must follow to secure them. Medical gatekeeping is more important in some countries than others, and has been a central point at issue in women's movement struggles throughout the period of abortion law reform. (Paradoxically, it was also doctors, many of them male, who pioneered the establishment of free-standing abortion clinics and broke the power of medical control institutionalized in hospital settings.) Similarly, the effective accessibility of abortion depends a good deal on the nature of a nation's health-care system and its coverage of the costs. For women in Ireland, and also in much of the nonmetropolitan United States, the cost of travel is a significant extra burden. The gap between a civil right to abortion in the sense of legal entitlement to abortion in approved circumstances and a social right to abortion independent of income is a political as much as a personal issue. Another recent comparative study of abortion politics (Julia S. O'Connor, Ann Shola Orloff, and Sheila Shaver, States, Markets, Families, 1999) showed that social rights to abortion are weaker in the United States and Canada, where first-trimester abortion has had judicial recognition as a right of the woman and where there are strong movements in opposition to it in the legislatures, than in Britain and Australia where it has been routinized as a form of medical care under the protection of medical professional interests.

Similarly, the tight structure of the book makes it difficult to see connections among the politics of abortion reform in different countries. There is, for example, little opportunity to see the impact of an event such as the U.S. Supreme Court decision in *Roe v. Wade* on abortion politics in other countries. Equally, it is unclear whether the European Union provided a vehicle for European policy agencies to work together, or to promote policy borrowing from one country to another. These are small complaints in a book that is a fine research achievement.

The Origins of Nonliberal Capitalism: Germany and Japan in Comparison. Edited by Wolfgang Streeck and Kozo Yamamura. Ithaca, NY: Cornell University Press, 2001. 304p. \$45.00 cloth.

Richard Deeg, Temple University

Motivated originally by a concern for the future of the German and Japanese economic models, the authors in this volume actually probe the origins and evolution of these two varieties of nonliberal capitalism. German and Japanese capitalism is nonliberal in that the economies of these countries are more socially and politically regulated than are their Anglo-American counterparts. Markets are also more "embedded" to the degree that economic transactions are also constrained to serve noneconomic objectives, such as social cohesion, or are supported by noneconomic social ties. Embeddedness, it is argued, creates higher levels of "committed labor" and "patient capital" and thus a long-term focus (and cooperation based on loyalty and trust) in economic relations among actors. One of the more intriguing findings of the volume is that formally, very different institutions generate functionally equivalent outcomes and systemic logics across the two cases.

The similar national paths of Germany and Japan are traced to a common starting condition in the late nineteenth century: In both, industrialization preceded democratization, and each had fairly strong and autonomous state elites who sought to build a market order while preserving social stability by granting social (in lieu of political) rights to selected groups. However, influenced by different cultures and institutional legacies, the two nations diverged in how these groups were incorporated into the emerging socioeconomic order. In Germany, they were typically brought in via corporatist arrangements between associations and the state. Japan, on the other hand, drew on the cultural idea of *ie* (family-like community) and the large firm became the key organizational locus of the modern political economy.

The contribution by Gerhard Lehmbruch explores the origins, evolution, and impact of the ideas that shaped each capitalism. He argues that in societies there are competing discourses and that usually one is hegemonic. This, in turn, supports the formation of institutions that follow its logic. Interestingly, he argues that in the midnineteenth century, German and Meiji elites—the latter influenced by the thinking of the former—were quite enamored with liberalism. Yet in both nations, a nonliberal discourse became hegemonic in the late nineteenth century. Subsequent crises presented challenges to this discourse, but it survived through adaptation.

Like Lehmbruch, Philip Manow sees the beliefs and actions of bureaucratic elites as crucial to the process of welfare state formation. Both nations developed nonliberal welfare regimes by first extending social rights to the skilled and employed (male) workers. They differed in that Germany

developed a corporatist pattern in which functional groups (unions and employer associations) came to play key roles in administering welfare state policies. Different conditions in Japan led the state to foster the internalization of the welfare regime within large firms. In a final argument, Manow stands the conventional view on its head by arguing that the nonliberal welfare regimes actually facilitated the emergence of labor relations regimes based on trust-based, long-term production (rather than the other way around).

Gregory Jackson explores the corporate governance regime of each nation and finds them functionally similar in that both command long-term commitment from providers of capital and labor. They achieve this through a combination of a closed ownership structure of large firms and a bank-based financial system—which precludes a market for corporate control and thus makes long-term commitments by management and capital possible—and a regime of 'industrial citizenship' that makes participation of labor in management possible. Jackson uses the idea of coevolution to explain how the two subsystems—property rights and industrial relations—gradually came to "fit together" to form these distinctive corporate governance regimes.

Sigurt Vitols analyzes the bank-based financial systems. Contrary to the common perception, he argues that both nations had liberal banking regimes before the 1930s. It was only in their responses to the banking crises of the late 1920s and early 1930s that these nations turned toward more interventionism and favored banks over equity markets in order to use the former to serve their respective national policy goals. The postwar preeminence of banks was furthered by the relatively higher income equality and absence of private pension systems in Germany and Japan, which meant that savings flowed to a much greater degree into the banking system than into the market.

The final contribution by Kathleen Thelen and Ikuo Kume analyzes how each nation found a different way to overcome the endemic collective-action problem of skill formation; that is, if left to markets alone, employers will underinvest in worker skills because worker mobility means that they cannot capture sufficient returns. The German solution came to be based on "solidarism" in which occupational groups that cut across firms were linked to the state. The collective-action problem was overcome because all firms bear the costs of training in an open external labor market. Japan's solution was "segmentalist," relying on social cohesion within the firm and creating internal labor markets through lifetime employment and related mechanisms.

One of the more interesting general findings of the volume is that decisions and events in the early phase of industrialization, while very important, did not definitively set these two nations on their nonliberal paths. For all of the authors, many of the key features of the postwar German and Japanese models are traced to the 1930s and the rationalization measures taken under strongly authoritarian regimes. These regimes were effective at overcoming the endemic friction between traditionalist particularism and modern universalism (and reconciling incompatible sectoral regimes) that beset them prior to this time in what Wolfgang Streeck, in his introductory chapter, calls the first synthesis (p. 29). The second synthesis came after the war and undid the first one by finding ways to integrate full democracy, free markets, and independent trade unions while still retaining a strong nonliberal character. Although I do not dispute this characterization, it bears a certain risk in that one could too easily be left with the impression that the midnineteenth to midtwentieth century was a (very) long period of continuous institutional disequilibrium, while the last half century has constituted (at least until recently) a strong equilibrium. Such a perception

would run counter to the intent of the authors. For, as is clear in a brief but penetrating exposition by Streeck (pp. 25–38), the authors actually avoid the holism that plagues much of the national varieties of capitalism literature: For these authors, internal contradictions between institutional subsystems are endemic and one of the key motors of institutional change.

To the book's credit, all of the authors invoke ideas, power, sequencing, and timing in explaining institutional formation and change. They also rely on a broad conception of path dependency to explain patterns of change; this, however, strikes me as a missed opportunity to break new theoretical ground by building more explicitly upon some of the more recent thinking in path dependency theory. Nonetheless, the book constitutes an exemplary and skillful application of historical institutional analysis by master practitioners. For this reason alone it is well worth reading. It is all the more deserving of attention because it also provides us with a unique and highly insightful comparative analysis of two leading national economies and suggests why they, despite tremendous success over a long period of time, may now be moving from nonliberal to liberal capitalism.

The Ramparts of Nations: Institutions and Immigration Policies in France and the United States. By Jeffrey M. Togman. Westport, CT: Praeger Publishers, 2001. 176p. \$49.00.

Leah Haus, Vassar College

Faced with similar economic circumstances, France and the United States adopted different immigration policies at various times in the twentieth century. Jeffrey Togman asks why. To account for this variation in public policy outcome, he points to the different structure of political institutions in the two countries.

Two examples of cases when the United States and France adopted quite different immigration policy measures are the period of economic prosperity in the 1950s and the beginnings of hard times in the early 1970s. In the former period, the United States enacted the restrictionist and discriminatory McCarran-Walter Act of 1952. This act largely retained the national-origins quota system that had been introduced in the early 1920s, and it remained in place until 1965 when it was replaced by more liberal measures. By contrast to the restrictionist McCarran-Walter Act, France instituted a liberal policy in the 1950s. When hard times began in the early 1970s, France adopted restrictionist measures that mandated a stop to legal labor immigration. Despite calls for increasing restrictionism from certain societal groups, the United States government did not enact major new immigration policy laws in the 1970s.

To explain these variations in public policy outcome, Togman sits with those scholars who stress the need to go beyond cultural and economic variables. For example, those who point to cultural traditions to explain a country's immigration policy fail to account for the sharp changes in American immigration policy during the course of the twentieth century. Togman draws instead on insights from the broader comparative political economy literature that discusses the role of state institutional structure to explain variations in government policy in the face of similar economic circumstances. He shows that insights from this broader literature can be fruitfully applied to the issue area of immigration policy.

Togman convincingly demonstrates that political institutions played an important role in shaping immigration policies in the United States and France. He shows that the fractured nature of the American state left multiple points of access for a broad range of interest groups to advocate, or

block policy proposals. As a result, Togman argues, any potential link between economic conditions and immigration policy outcome was broken in the U.S. case, rendering the policy outcome highly unpredictable. Sometimes policy moved in the direction of restrictionism, and at other times in the direction of openness. He then shows that the unitary and relatively autonomous nature of the French state allowed officials to broach immigration policy in a technocratic manner and to uphold a link between economic circumstances and immigration policy, adopting liberal measures in the postwar period of prosperity and restrictionist measures when hard times set in. To illustrate the role of institutions, he provides a historical narrative of changes in American immigration policy during the twentieth century and of French immigration policy since World War II.

Togman covers some policy shifts that are in the direction of greater restrictionism and others that move to greater openness. In discussing both, he brings an important balance to the scholarship on immigration policy by reminding us that the political institutional structures of "liberal democracies" have led to the adoption of restrictionist measures, not just liberal measures, at various times in the twentieth century; and that these institutions have allowed restrictive forces, not just pro-immigration business, to organize effectively.

The book begins to address the question of why there are sometimes movements in the direction of restrictionism and why at other times there are movements in the direction of openness, or variations in policy outcome over time. He shows that France's unitary state structure enabled the government to adopt a technocratic approach that allowed economic circumstances to influence the direction of immigration policy. In contrast, Togman argues, in the United States it is difficult to know when "pro-immigration or anti-immigration coalitions will carry the day, or when coalitions will shift" (p. 19).

The author leaves no guidelines for understanding the direction of policy change in the fractured American state over time throughout the twentieth century. Moreover, as he notes, there have been recent changes in French political institutions in the direction of the more fractured institutional structure that exists in the United States. This leaves us with few guidelines for understanding the direction of immigration policy changes in France as well.

Togman could go further in considering alternative possible explanations for variations in American immigration policy over time, and counter them if he wishes to argue that there are no guidelines. For example, one might suggest to him that heightened concerns with national-security circumstances help us to understand the direction of immigration policy change, or variations over time. The restrictionist legislation of the early twentieth century came during or shortly after World War I and the "Red Scare" (beginning with the literacy test for immigrants that was enacted in 1917, and then intensifying with the Emergency Quota Act of 1921, which also came in a year when unemployment hit 11%). The restrictionist McCarran-Walter Act came at the height of the Cold War. And, most recently, although not yet enacted, the discussions over the adoption of a new amnesty program that figured prominently in the summer of 2001 disappeared from the agenda after September 11. By contrast, movements in the direction of openness came at times when there was no particularly heightened concern with nationalsecurity circumstances.

The book would likewise be strengthened by including a preliminary discussion of a broader range of countries in order to broach more thoroughly the question of variations across country, and to give some guidelines for conducting future research to explore further the importance of political institutional structure. There were other advanced industri-

alized countries, such as Switzerland, that adopted policies fairly similar to those in France, encouraging immigration in the postwar period of prosperity, and imposing restrictive measures when hard times set in. But they did not share the same institutional structure as France. A thorough assessment of the ways in which political institutions shape immigration policies would benefit from some initial discussion of these other cases.

The Ramparts of Nations is a succinct and clearly articulated book that will be of benefit to those readers interested in immigration policy.

Elusive Reform: Democracy and the Rule of Law in Latin America. By Mark Ungar. Boulder, CO: Lynne Rienner, 2001. 273p. \$55.00.

Pilar Domingo, Queen Mary, University of London

Elusive Reform is an important and welcome addition to the still underdeveloped area of political science analysis of judicial institutions in Latin America. Few volumes to date have undertaken such an in-depth study of the complex issue of rule of law and its problematic construction in fragile democratic systems in the region. The book analyzes the experience of rule of law reform in Argentina and Venezuela, with some comparative reference to other Latin American countries.

Drawing on the transitions literature, the author seeks to address a number of challenges that new democracies face, with particular regard for the issues of legal accountability of public office, mechanisms of rights protection and independent adjudication, and access to justice—all critical elements of rule of law. To its merit, the book goes beyond the more policy-oriented approaches to the study of judicial reform processes, and takes on board a more ambitious discussion of the complex relationship between rule of law, state formation, and democratic consolidation in Latin America. With different political trajectories, the two case studies present contrasting examples of the range of factors that motivate rule of law reform, on the one hand, and facilitate or hinder the effectiveness of these reforms, on the other. In Venezuela, reform in recent decades was prompted by a desire to improve executive responsiveness and judicial access; in Argentina, following a history of violence and authoritarianism, judicial reform was expressed in a concern with limiting executive dominance and improving judicial accountability.

Two running themes of the book are brought together as an explicative framework from which to assess the weaknesses of rule of law: the issues of executive domination—seen as either too repressive or too unresponsive—and judicial disarray—understood as the whole gamut of problems within the different judicial agencies, ranging from corruption, delay, bureaucratic obstacles, and insufficient resources to political obstacles. In an analysis of the different levels at which the judicial function operates, Mark Ungar seeks to disentangle the complex web of factors that affect the workings of the legal processes and rights-protection mechanisms. As he rightly point out, this has implications for the prospects of building regime legitimacy and facilitating democratic consolidation.

The book begins with a historical review of the process of state formation in Latin America, in which rule of law lagged behind other political and state priorities, while centralist trends, personalism, and a recurrent recourse to coercive strategies by embattled executive branches prevailed as the route by which to build a sense of national cohesion. Although the historical analysis adds somewhat to existing historiography on the development of rule of law in the region, of greater interest are the author's observations on the contemporary relationship between democratization, the state,

and the rule of law. These are developed particularly in the early chapters. Here the multilayered analysis of the judicial function and its workings throughout the state bureaucracy not only within judicial institutions—is rich with insight regarding the complexities of law enforcement and the many opportunities available to thwart rule-of-law enhancement. As Ungar rightly points out, law enforcement is not only a matter for judicial institutions; it takes place throughout the state at different levels of the public administration, within both the executive and legislative branches. Following from this, he identifies two types of necessary reforms: administrative reforms aimed at improving state agencies' functioning so that they better uphold the law in their daily actions; and accountability measures that monitor the degree to which these agencies adequately protect constitutional rights and make justice accessible.

From this analysis, the author raises interesting questions about the timing of reform initiatives, and he follows the process through from the political moment of passage of reform to the range of institutional and attitudinal problems that obstruct the implementation phase, and ultimately undermine the effectiveness of well-intentioned reforms. Critical political moments in which the balance of political and social forces is restructured, for instance during a regime transition, may indeed open up opportunities for reform. New democratic governments may seek electoral approval through reforms that combat corruption, illegality, and rights abuses. But despite appearances of change and renovation, continuities from the past within state bureaucratic structures obstruct the implementation of reforms that are perceived as threatening to a variety of vested interests. This combines with a legacy of nondemocratic attitudes and codes of practice that diminish the effectiveness of reforms. Ultimately, despite these obstacles, Ungar suggests that piecemeal reform initiatives can establish pockets of improvement in rule of law, and encourage law-abiding practices within the lawenforcement bodies and other state agencies that may eventually redirect old attitudes that fostered corruption and lack of accountability.

While Ungar's dialogue with transition theory is commendable, and suggestive questions are raised, ultimately the book falls short of developing a clear theoretical proposition regarding the place of rule of law in the recent democratic processes. The theoretical concerns introduced at the beginning of the book are not fully developed in the later, more empirical chapters. Instead, the later discussion of specific aspects of rule of law at times falls into the more prescriptive trappings of other judicial reform studies.

Nonetheless, the case studies are important in themselves. Chapters 3 to 7 focus on specific areas of the judicial function. Notably, much attention is given to the criminal justice system, with particular emphasis on the workings of the police, viewed by the author as being especially illustrative of the state's capacity and degree of commitment to abide by constitutional principles. Other key areas are the issues of judicial independence, the recent experience with judicial councils and defensorías del pueblo (human rights ombudsman), judicial access, and community justice. The chapters are based on thorough and extensive research, and do in large measure build up an integrated picture of the ways in which rule of law operates in the two case studies, the advances that have been achieved, and the areas where resistance to reform still persist. Moreover, the contextual and political analysis so often lacking in judicial reform studies—is insightful and highly suggestive of the complexities of reform processes.

The book is an important addition to the study of rule of law in the region and will be a key text for students and scholars of judicial politics in Latin America. Its major contributions lie, firstly, in prompting further theoretical probings into the role of rule of law and justice mechanisms in democratic processes. Secondly, it develops a suggestive analytical framework that unpacks the complex elements that constitute rule of law. And finally, the book is an insightful study of two telling experiences of judicial reform in the region.

Basic Income on the Agenda: Policy Objectives and Political Chances. Edited by Robert van der Veen and Loek Groot. Amsterdam: Amsterdam University Press, 2001. 290p. \$32.00.

Robert Henry Cox, University of Oklahoma

This book tells the story of a dog that did not bark. Since the 1980s, a number of European scholars have advocated a system of income support that would eliminate the stigma attached to most forms of poverty assistance and would be simple, easy, and cheap to implement. Their idea, which has various forms, is to provide all citizens a guaranteed level of support that would have no strings attached. Organized as the Basic Income European Network (BIEN), these scholars have met regularly to discuss the subject of basic income and have endeavored to make their research useful to policymaking by promoting their group's ideas in their home countries. The problem is that after more than a decade of activity, the group cannot claim any major success. To the contrary, many countries have striven to make unemployment and social assistance more conditional by attaching work requirements or lowering thresholds of eligibility.

Basic Income on the Agenda is a chronicle of these efforts. Based on the papers presented at the seventh annual meeting of the BIEN scholars, held in 1998, the volume suffers the predictable unevenness of a conference proceeding. Some contributions are shrill and polemic. One contribution is missing its bibliography (p. 154). The volume's content is divided into two parts. The first part consists of general essays, some conceptual, some polemical in tone. Taken together, the essays of the first part provide a rich picture of what the debate over basic income is and why the members of the BIEN network are so passionate about it as a policy solution. For those unfamiliar with the debate, the editors offer a sound overview that outlines various forms of basic income proposals, ranging from negative income tax to tax credits to "citizens' wage" schemes.

These essays also demonstrate that there is no party line within the group of scholars who study and advocate for basic income. One by Phillipe van Parijs, the intellectual majordomo of the movement, compares the likely effects of basic income with the earned income tax credit and reductions of social security contributions. His conclusion is that even a partial basic income is superior to the other two if the policy objective is to maximize the "real freedom of the worst off" (p. 80). Other contributions to the first part of the volume analyze such themes as the likely egalitarian effects of basic income, its consequences for gender relations, or its merits compared to workfare schemes. All of this has a rather speculative character. Perhaps the most grounded essay comes from Fritz Scharpf who, considering the question of whether the European Union could provide a vehicle for pressuring countries to adopt basic income, concludes that he is doubtful of basic income's political viability and dubious of its normative soundness (p. 155)

The second part of the book is a survey of countries where basic income proposals have been under discussion. Here the stories of failure outnumber the successes, and for reasons that support Scharpf's skepticism. Denmark, Sweden, the Netherlands, and Germany are countries where basic income

proposals have failed to get off the ground. In these countries, basic income proposals have been rejected even by the social democratic Left, which sees a duty to work as a prerequisite for social solidarity. In Ireland, a plan to create an income tax credit is gaining support, while basic income has withered. France appears to have acquired a basic income scheme as an unintended consequence of a scheme originally designed to reintegrate people into the workforce. Its Revenu Minimum d'Insertion (RMI), adopted in 1988, was intended to combine income assistance with reintegration into the workforce. In the face of high unemployment, however, French officials dropped the return-to-work requirements of the RMI program, leaving behind only the income assistance program. In Belgium, a political party called VIVANT was created by a business entrepreneur to promote a basic income program. After gaining some attention in 1999, the party, like all singleissue movements, proved to be a one-election phenomenon. Among the Belgian mainstream, there is no support for basic

Finland appears to be the only country where real basic income has any political support, but even here it is the small,

left-wing parties that have embraced the idea. Among the political mainstream it continues to be dismissed, and there is no real proposal under consideration. Indeed, one could say that the success of the idea in that country is a direct consequence of an embarrassment of riches. With high economic growth and low unemployment, providing unconditional assistance to the poor is less controversial, and therefore the advocates of basic income have been afforded a wider audience.

As this volume indicates, basic income has been a noble ideal, but its political impact has been minimal. For anyone interested in the history of this idea, the second part of the volume provides a nice summary of social policy discussions in many European countries. These contributions are valuable descriptions of the life and death of a policy idea. The first part of the volume is less useful, owing to the uneven quality of the contributions. And most of the contributions in the first part are too speculative or polemical to have much lasting value. As the debate over the future of Europe's welfare states progresses, the issue of basic income is likely to remain a peripheral topic with a dedicated, if ineffective, following.

## International Politics

Establishing the Supremacy of European Law: The Making of an International Rule of Law in Europe. By Karen J. Alter. Oxford: Oxford University Press, 2001. 284p. \$60.00.

Leslie Friedman Goldstein, University of Delaware

Before 1990, American political and even legal scholarship paid little attention to the mystery and the marvel of the role played by the European Court of Justice (ECJ) in constituting the European Community (EC; now European Union, or EU) as something very like a transnational, federated state with its own higher law constitution and supremacy of union-level law, enforceable and enforced against memberstate (i.e., member-country) laws or constitutional provisions to the contrary. Legal scholars Eric Stein and Joseph Weiler and political scientist Mary Volcansek (with a comparative judicial politics approach) had produced sustained bodies of scholarship on the subject, and Stuart Scheingold had offered a book on it back in 1971 (which took an international relations approach), but not much else was available for the curious American academic. The decade of the 1990s changed this picture. Now a generation of young scholars and some more recently engaged established scholars have taken up the challenge of attempting to understand this remarkable, and in many ways unprecedented, phenomenon.

With this book, Karen Alter adds to the corpus of recent volumes (Andrew Moravscik, The Choice for Europe, 1998; Walter Mattli, The Logic of Regional Integration, 1999; Leslie Friedman Goldstein, Constituting Federal Sovereignty, 2001) that attempt to explain the remarkable transformation of the European Economic Community (EEC) within the space of 12 years from a group of six countries loosely bound by a treaty aiming to eliminate tariff barriers into what was in legal terms a quasi-state arranged like a federation. Within this community, 1) the Treaty of Rome functioned as a supremelaw-of-the-land constitution, rendering void any memberstate (i.e., nation-state) laws or constitutional provisions to the contrary, including ones adopted later than the treaty; 2) EC regulations and directives—in other words, EC-level law—adopted under the authority of the Treaty of Rome also were supreme over member-state laws or constitutional

provisions; 3) member-state courts were enforcing these rules, that is, treating their own countries' laws as void on the grounds of conflict with Euro-level law; and 4) member-state governments by and large (although not without some prominent exceptions) were going along with this system.

Moravscik's book treats the EC/EU as a remarkably impressive example of international integration and attempts to understand it by a close examination of the motivations of domestic political actors who pushed for and/or accepted an increasingly tight union. Mattli's book uses a comparative approach, comparing EU development with the evolution of other customs unions in Europe. Goldstein's, too, uses a comparative approach, offering a historical institutionalist analysis of four modern, voluntarily federated unions, some with a dominant judiciary and some without. Karen Alter, too, in this book has produced a comparative, historical institutionalist account of the ECJ's self-transformation into what she terms "a Constitutional Court for Europe, able to practice judicial review of European law and national law" (p. 225).

Unlike the other explanatory efforts, this one zeroes in on judicial politics. What it compares is the reactions of the French judiciary and the German judiciary, and of the political (i.e., electorally accountable) branches of their respective governments to the various union-building decisions of the ECJ, and to each other's reactions. The way that it is historically institutionalist is that it examines the operation and changes over time of both incentives and constraints on political (including judicial) actors that the politico-legal institutions of each country and of the EC/EU establish.

Her first chapter sets up the riddle: How did this result emerge from a treaty whose authors and ratifiers did not either spell out or intend this higher law judicial review system? She breaks this down into three core questions: "Why did national courts accept a role enforcing European law supremacy? Why did national governments [by which she means the political branches] accept the ECJ's supremacy doctrine and national court enforcement of European law supremacy? How did the transformation of the European legal system contribute to the emergence of an international rule of law in Europe?" (p. 27). Her answers fill more than two hundred pages, and a brief summary cannot do them justice.

She focuses on France and Germany and conducted several dozen interviews of high-level players, scholars, and journalists, scoured the secondary literature and read the relevant cases. Party politics sometimes mattered; individual judges sometimes mattered; the fact that the ECJ's innovation gave judicial review power to many judges and constricted the judicial review power of certain high courts sometimes mattered; national legal traditions sometimes mattered. And it mattered a lot that—as is always the case with judicial review relying on documents that require unanimity or even a supramajority for alteration—the power to interpret (the Treaty of Rome or Euro-level law) gave tremendous power to the interpreter (the ECJ); in order to overcome an interpretation, one has to secure unanimous or near-unanimous agreement on an alternative. She concludes that the long-term interaction of resistance-acquiescence among the various institutions is best characterized as a process of negotiation (pp. 44-45)

Prodigious research underlies this book; the analytic account of the French and German cases is rich, nuanced, detailed, and carefully contextualized. She engages the arguments of other scholars in impressive ways. She has unearthed an example of member-state resistance to the ECJ that was omitted from other accounts: In 1966 the administrative court in Frankfurt flatly declared invalid a European regulation, in effect rejecting the supremacy doctrine (p. 76). (The Constitutional Court implicitly reversed this ruling a year later [p. 78].) She also mentions a report in an unpublished paper that in 1976, the French parliament gave itself power to nullify European law (p. 152), but this may be spurious, since it is omitted from published accounts by scholars such as Hialte Rasmussen (On Law and Policy in the European Court of Justice, 1986) and M.-F. Buffet-Tchakoloff (La France Devant La Cour de Justice des Communautés Européennes, 1985).

Perhaps in a research effort this massive and this detailed, it is inevitable that one finds an occasional error: She asserts that John Marshall did *not* exercise the power of judicial review in the case of Marbury v. Madison (which is famous precisely because Marshall did exercise the power there, declaring a federal law unconstitutional); and she gives as the date of the French parliament's legislated defiance of the Euratom Treaty of 1978 (again relying on her unpublished source, J.-P. Jacqué) when Buffet-Tchakaloff's book (p. 366) dates it at 1980 (the proposal having been tabled in 1978). At a more substantial level, one can disagree with some of her arguments. (In particular, she seems not to have reflected as much as one would like on what "democratic accountability" would mean in a federated system, and on its desirable relationship to judicial independence and the protection of fundamental rights, [see pp. 207-8]). And one can even disagree with her rhetoric: She insists throughout on describing ECJ law as "international law" when most scholars use the term "transnational" or "supranational" to connote that this legal regime is so tightly integrated that a new term is needed for it. Nonetheless, for now, this book stands as the definitive account of the judicial politics that indeed produced "the making of an international rule of law in Europe."

The Frontiers of the European Union. By Malcolm Anderson and Eberhard Bort. New York: Palgrave, 2000. 235p. \$65.00.

Erik Jones, University of Nottingham

The "borderless world" is an early twenty-first century cliche, particularly in Europe. Overlapping processes of globalization and regional integration have done much over the past decades to alter the political and economic nature of geographic boundaries. As a result, the tendency is to anticipate

a fundamental deterritorialization of politics and economics. However tempting, it would nevertheless be hazardous to rush to judgment. Through a series of overlapping case studies—essays, really—Malcolm Anderson and Eberhard Bort demonstrate that frontiers remain important both within the European Union (EU) and without. Politics and economics continue to be rooted in geography despite the transformations of the late twentieth century. This is true not only in practical terms but also in relation to individual and group identities. As the authors suggest, "there remains in Europe a highly developed sense of territoriality" (p. 11).

Such arguments may find few converts among the statistically inclined. Rather than measure the flows of activity across borders, Anderson and Bort have relied on interviews with an odd assortment of individuals having some direct linkage with the management of geographic boundaries. Police officials, local councillors, civic administrators, and other interested parties form the backdrop against which the authors reflect upon developments both in the world and in our understanding of it. In turn, the insights they derive are organized into surveys of general theory and specific problems, French borders, European borders, and the changing boundaries between Europe's East and West. At times the overlap between these essays becomes slightly repetitive—as when the authors recount the push of migrants across the Swiss-German border in near-identical language on pages 102 and 126. The authors also tend to throw in allusions or concepts that interested readers may find unfamiliar—such as the distinction between boundaries and frontiers as implied by the Roman word limes.

Nevertheless, Anderson and Bort make a persuasive argument that is usefully documented and selectively detailed. Their discussion of European efforts to encourage the development of transfrontier cooperation (pp. 45–74), for example, sheds welcome light on the context, design, and implementation of a raft of different programs—each of which serves as an umbrella for an even more diverse collection of specific projects. Given this sea of variety, the authors can be forgiven a somewhat anecdotal approach. Readers are expected to have confidence in the authors as they "attempt at a general political assessment" (p. 10), and yet the authors provide sufficient basis for believing that such confidence is warranted.

Anderson and Bort also raise a number of points that seem obvious upon reflection, though counterintuitive at first glance. Foremost among these is that the spread of English-language learning may have the effect of strengthening rather than lessening national divisions (pp. 51–54). Alsatians and Saarlanders no longer make the effort to learn German or French, at least not in numbers comparable to those before World War II. Moreover, the same is true in virtually all bilingual border regions—such as French-Italian, French-Spanish, Italian-German, and so forth. Even populations in plurilingual countries such as Belgium show more interest in learning English than in learning the languages of their compatriots. Hence, the authors suggest that "language frontiers" are resistant to the fast pace of economic change and will develop "only as a consequence of long-term social processes" (p. 54).

As if linguistic divisions were not enough of a problem, Anderson and Bort suggest that cross-border cooperation may itself give rise to conflict (p. 73). As diverse groups engage in collective action across political boundaries, it is only natural that they should scrutinize the distribution of costs and benefits. And where collective action is unsupported by collective identity (or common purpose), the likelihood that different groups will object to differences in distributive outcomes cannot be discounted. They suggest that this is where central authorities have a role to play, bolstered where possible by the European Union. Given the structure of the argument,

however, it is unclear what that role should be (at least in general terms) or why central authorities would choose to play it.

Along a similar vein, Anderson and Bort posit a contrast between the western expansion of the United States and the eastern enlargement of the European Union (p. 143). This contrast is at the same time self-evident and yet worthy of repetition. The American pioneers of the nineteenth century sought to bring an untamed wilderness into the ambit of "civilization." The European enlargement negotiators of the twenty-first century must contend with existing states thatwhatever their current difficulties—are unlikely to discard their values and cultures. Enlargement is about collective action and not manifest destiny. Hence, it is also potentially a source of cross-border conflict. Moreover, should enlargement succeed, it will have the effect of pushing the borders of the European Union outward toward an even more unstable East-heightening the vulnerability of the union as a whole and shunting much of the responsibility for shielding the union onto its new entrants. Indeed, given the structure of the enlargement process, much of these expansion effects have already begun to take place.

Borders remain important, geography matters, and territoriality runs deep. This is hardly an idealistic conclusion, and neither it is likely to prove popular. Still, it is realistic. And it leaves considerable scope for change nonetheless. For while Anderson and Bort succeed in documenting the resilience of territorial politics, they also provide substantial evidence of the will of policymakers at all levels to make the most of cross-border cooperation. Implicit in the evidence provided by the authors is a strong persistence to improve upon a politics and an economics that are (and are likely to remain) geographically structured. As a result, geographic boundaries will remain important, even as the nature of that importance continues to evolve. Whether internal or external, the frontiers of the European Union are not static. And more than anything else, it is the adaptive nature of these frontiers that explains their continuing relevance to economic and political life in Europe.

The Guilt of Nations: Restitution and Negotiating Historical Injustices. By Elazar Barkan. Baltimore: Johns Hopkins University Press, 2001. 456p. \$18.95.

Waldemar Hanasz, University of Pennsylvania

It seems timely and appropriate that the twentieth century—the century of the Holocaust, the Gulag Archipelago, the Killing Fields, the Cultural Revolution, and the "ethnic cleansing" in the Balkans and Rwanda—ended with a wave of growing interest in healing past injustices. Human rights organizations and international commissions investigate violations of human rights. International tribunals judge political leaders, warlords, and their soldiers. Historians, political scientists, and legal theorists study the implications of such crimes and punishments.

While most recent studies concentrate on the tortuous procedure of putting perpetrators on trial—Martha Minow's Between Vengeance and Forgiveness: Facing History after Genocide and Mass Violence (1998), Howard Ball's Prosecuting War Crimes and Genocide: The Twentieth Century Experience (1999), and Gary Jonathan Bass's Stay the Hand of Vengeance: The Politics of War Crimes Tribunals (2000)—Elazar Barkan's book outlines the worldwide trend of victim restitution for past sufferings. By analyzing some cases in which wrongdoers or their descendants have embraced guilt and responsibility, Barkan is able to explore "how various national and ethnic identities change as a result of in-

teractions between rival groups and the attempts of groups to redress through negotiation painful historical injustices" (pp. x-xi). According to the author, these interactions between offenders and victims not only solve local problems but also generate a novel system of global morality.

The book is divided into two parts, each presenting a number of cases. The first part covers some of the consequences of World War II: West Germany's reparations for the Holocaust, the U.S. governments handling of the internment of Japanese Americans, the case of the Japanese army's sex slaves, the story of Jewish accounts and Nazi gold in Swiss banks, and some complex debates about restitution in East Central Europe. The second part deals with the residues of colonialism, especially the cases of indigenous groups in North America, Australia, and New Zealand. The demand for reparation for American slavery is also discussed. Barkan's presentation of these cases is comprehensive and interdisciplinary. His knowledge of local cultures, history, sociology, and international law meets the book's high demands. Although there is no doubt that he welcomes the whole process of restitution, his evaluations of the complicated cases are quite well balanced.

The fact that some perpetrators or their descendants are pressed to admit their guilt and express apologies is not entirely new. What is new is the voluntary willingness of the past offenders to enter into negotiations with their victims and to meet some of their demands, including the demands for material compensation. Restitution agreements are reached without coercion and third-party engagement. The process of negotiation, Barkan argues, redefines the historical identity of offenders and victims alike. Of course, both sides want to achieve different goals. Past offenders want to end accusations and to defend their status quo, while victims want their harms to be acknowledged and, if possible, restitution.

In each case, the ideas of moral responsibility and justice are redefined, too. Barkan argues that the restitution cases illustrate a new framework of global morality—he calls it "a neo-Enlightenment morality"—based on negotiation and voluntary agreement between antagonistic groups. The idea of fairness is rooted in the culture of each rival group and the historical context of particular conflict. The neo-Enlightenment morality recognizes that global justice depends on multicultural negotiations. Again, the demand that social groups act morally is not entirely new; what is new is the demand that antagonistic groups respect the cultural principles of their opponents. Moreover, the dialogue of rival groups upgrades the traditional framework of rights. As such, according to Barkan, this morality goes beyond the principles of liberalism. First, it includes not only individual rights but also group rights. Second, it articulates "a relation between universal values and local customs as fundamental rights" (p. 329). Third, it can validate the particular goals as legitimate values and rights. That continuous interplay of universal principles and practical patterns constitutes a new universe of moral and political values.

However, Barkan's assumption that the liberal tradition needs to be reformed because individual rights neglect group identities and group interests is rather unconvincing. It is by no means clear why classical liberal principles would need such reform. After all, individual rights easily explain why it is wrong to execute innocent civilians in concentration camps, imprison them in internment camps, force them to become sex slaves, or confiscate their estates and banking accounts. In most cases, individual rights can also cogently legitimize restitution claims.

In fact, trying to explain these injustices in group terms is, in a sense, a step back, because it returns to the discriminatory language of past perpetrators. The victims of the Holocaust

or the ethnic cleansing deserve redress for their suffering as human individuals, not only as Jews or Muslims. Locke, Kant, J. S. Mill, and other fathers of liberalism lived in a world filled with group privileges and viewed the moral philosophy of individual rights as a significant advancement. It is a fundamental principle of liberal philosophy that each individual is free to decide to which religious or political groups to belong. Consequently, the public institutions and policies of contemporary liberal democracies—concerning security, health, education, and so on—apply to all citizens as individual human beings, regardless of their group identity.

Despite an impressive eloquence of its descriptive part, Barkan's book does not prove that a return to the world of group rights would be an improvement today. It is to be hoped that legal theorists and philosophers will continue discussing the importance of group rights.

## Moral Victories: How Activists Provoke Multilateral Action. By Susan Burgerman. Ithaca, NY: Cornell University Press, 2001. 186p. \$29.95.

Ann Marie Clark, Purdue University

A lot of scholarly attention has been devoted to demonstrating that transnational activists "matter" in explaining international outcomes. Having paid those dues, it can be argued that scholars of transnational activity can safely shift from a documentary focus to a more profound inquiry concerning how, why, and to what extent nonstate actors matter. On the other hand, to understand the work of transnational activists for the international implementation of moral and legal standards—not a completely new area of inquiry, but a burgeoning one-still requires a considerable amount of empirical documentation of exactly what that work entails. Only time-intensive, border-hopping research provides the names, dates, and actors' words, deeds, and intentions that comprise whatever political activity there is to be theorized about. Thus, both empirical documentation and theorizing about transnational and multilateral processes are demanding, and interdependent, scholarly necessities. In her book Moral Victories: How Activists Provoke Multilateral Action, Susan Burgerman presents finely articulated empirical research that is a welcome contribution to the literature on human rights in multilateral political processes.

The centerpiece, and in my view the strong point, of Burgerman's nicely written and relatively brief book is the case study research. Through interviews, primary documents, and secondary sources, she chronicles the development and implementation of United Nations-negotiated peace settlements through the UN Observer Mission in El Salvador (ONUSAL) and the UN Mission in Guatemala (MINUGUA). ONUSAL, deployed in 1991, was the first such agreement to incorporate human rights monitoring into its peace-building component. MINUGUA, deployed in 1994, did so as well. These cases are inherently important in that they represent, as Burgerman notes, early examples of "the latest, most interventionist stage in the implementation of human rights norms" (p. 21). The book stands firmly on its merits as a balanced study of the development of the two Central American peace processes in their complex domestic and international contexts (which included human rights activism). She maintains, as the title suggests, that activists were very important in making sure that human rights considerations for both countries stayed on the international agenda. She relies on the transnational advocacy network concept, originated by Kathryn Sikkink and elaborated by Margaret Keck and Sikkink in Activists Beyond Borders (1998), to characterize that role. While highlighting the visibility of human rights advocates in her cases,

Burgerman's study does not plow new theoretical ground in this area; instead, it carries the transnational advocacy concept to a new institutional context, as one explanatory factor among others. I mention this because the book's subtitle seems to suggest a more sustained elaboration on the causal role of transnational human rights advocacy in relation to multilateral action.

El Salvador and Guatemala experienced decades-long civil wars between government-backed forces and armed guerrillas. After a brief history of each conflict, the case studies open at the beginning of the 1980s, a time of severe human rights violations in both Central American countries. This was also a period of significant growth for the transnational human rights advocacy network, that is, the network made up of domestic and international human rights activists, officials pursuing a human rights agenda within the foreign policy arms of some governments, and the agents of international organizations' human rights mechanisms.

Both conflicts were fueled in large part by Cold War concerns and externally supplied armed forces. In El Salvador, the fight reached what Burgerman calls a "hurting stalemate" before the parties could be coaxed to the table after the withdrawal of U.S. support for the government in 1989. In Guatemala, the guerrillas never were strong enough to claim a military stalemate, but neither did the government enjoy overwhelming material support from the United States after the 1970s. Still, reputational incentives in a post-Cold War international context finally resulted in a "tenuous" agreement to negotiate a peace in Guatemala, although the negotiations

themselves spanned six years (see pp. 102–3).

Burgerman analyzes ONUSAL and MINUGUA to determine the most important factors behind the incorporation of "human rights enforcement" in the agreements. (For the author, enforcement refers to binding and interventionary, but not necessarily military, action on the part of the international community [pp. 18–19]). As appropriate for a study of two cases with similar outcomes (in which human rights standards were, in the end, incorporated into the agreements), Burgerman posits five necessary but not sufficient conditions that determine the profile of human rights in the countries' UN-backed peace processes. These factors work together to "determine the extent to which the international community" will employ "sanctioning mechanisms of the human rights regime" against a state with human rights violations (p. 5). They are 1) the existence and legitimacy of international human rights norms, which have become increasingly institutionalized; 2) lack of interference by a major power with overriding political or economic interests in the country, which can inhibit human rights enforcement; 3) activism by the transnational human rights network, which puts pressure on the target state; 4) a domestic political elite that comes to believe that its reputation or that of its country is on the line if human rights violations continue, and which can control its domestic military counterparts; and 5) a domestic human rights network, which can maintain links with its transnational counterpart (pp. 4-5).

These factors have strong roots in the international relations and comparative literature on the politics of human rights. Burgerman applies them in a new domain, by examining multilateral human rights enforcement decisions by the international community, and her findings are corroborative in the new context. On the subject of human rights activism, this research illustrates the role transnational advocacy networks have played on the stage of UN peace processes. Given that transnational advocacy networks by definition are made up of many different kinds of actors, a further direction for theoretical work may be to specify, both theoretically and practically, the differing causal impacts of different

members of the network. This is something she should consider pursuing further, based on the elements that comprise her promising set of necessary conditions for human rights enforcement.

A commitment to enforcement raises the stakes of multilateral action significantly, and Burgerman's study suggests that to muster collective action on human rights requires a special set of conditions that are complex but that possess a general profile applicable to other cases. She herself does so briefly with a limited study of the United Nations Transitional Authority in Cambodia (UNTAC) in her final chapter, and briefer discussions of a few other cases. Her conclusion that network pressure is necessary for the international community's enforcement of human rights principles is strengthened by comparison with the UNTAC process, implemented in the early 1990s. Among other problems her discussion outlines, UNTAC received less attention from the human rights network, resulting in a less prominent place for human rights in the agreement. In the conclusion, the author also presents a well-informed discussion of her study's policy implications for the design of future operations.

Burgerman's *Moral Victories* is a solid and very readable contribution to the literature on attempts to implement the international human rights regime. The book would be suitable for an upper-division undergraduate or graduate course on international organization, comparative Latin American politics, or human rights, and is to be recommended as a study of human rights in UN peace processes.

Africa's Challenge to International Relations Theory. Edited by Kevin C. Dunn and Timothy M. Shaw. New York: Palgrave, 2001. 242p. \$65.00.

Clement E. Adibe, DePaul University and The Norwegian Institute of International Affairs

Africa's Challenge to International Relations Theory, edited by Kevin Dunn and Timothy Shaw, offers a timely reflection on the content and nuance of international relations theory in an era of "the new inequality" (Craig Murphy, "Political Consequences of the New Inequality," International Studies Quarterly 45 [September 2001]: 347–56). The central question posed by the authors is: How international is international relations theory? In the authors' view, not very much. As a consequence, their objective in the volume is "to replace the dominant/dominating denotative reading of the IR text with a more pluralist connotative reading" (p. 8; my emphasis). Drawing on African experiences in the discipline of international relations, all 13 chapters of this engaging volume take aim at various manifestations of the Eurocentricity and "provincialism" of international relations theory then and now. Very early in the volume, Dunn sets the stage for a deliberate and systematic engagement with the discipline for its relegation of Africa to the footnote of international relations theory (p. 4).

For the past decade, the marginalization of Africa in world affairs has been the staple of comparative politics. But as the essays in this volume show, Africa has not fared better in international relations theory and analyses either. The reason, according to Dunn (Chapter 4), may be too nuanced to constitute a bona fide analytical variable for the parsimonious inclinations of much of contemporary international relations theory. Consider, for instance, the pervasive assumption of savagery—that "Africans were just being Africans"—that echoed in sections of the international media and policymaking constituency in the aftermath of the Rwandan genocide of 1994 (p. 4; and Philip Gouvrevitch, We Wish to Inform You That Tomorrow We Will Be Killed with Our Families: Stories

from Rwanda, 1998). Not surprisingly, such glaring insensitivity in policymaking and in scholarship to the plight of Africans has raised questions about the continuing centrality of race in international politics (Chapter 8).

This volume is, however, much more than an oversized catalogue of the misrepresentations and disrespect of Africa in the discipline of international relations, although it would appear to be doing precisely that at first glance. Indeed, it offers a rich and insightful discussion of the two poles of international politics: power and powerlessness. If the former has been overemphasized in international relations from the classical to the modern era, the relative neglect of the latter should be of concern to modern-day theorists who must formulate universal theories of international politics. Herein lies the strength of this volume as a bold attempt to "demonstrate the centrality of the experience of the [African] continent to every theoretical approach to IR" (p. ix). In this regard, Siba Grovogui's excellent comparative analysis of the "problem" of sovereignty and quasi statehood in Africa (Chapter 3) and John F. Clark's compelling attempts to apply realist and neorealist traditions to Africa's post-Cold War international relations (Chapter 6) merit a closer reading.

Unlike Dunn (Chapters 1 and 4) and Assis Malaquias (Chapter 2), who argue willy-nilly that Africa is sui generis, Grovogui and Clark contend that the content and outline of Africa's international relations are not nearly as different from those of Europe and other parts of the world as had been widely and erroneously assumed. Take, for example, the notion of the artificiality of the boundaries of African states, which has been discussed ad nauseam by innumerable works on the state in Africa. In dismissing this as a "special" attribute of the African state, Grovogui argues quite pointedly that "Belgium and Switzerland display the same 'artificial' features as their contemporary African counterpart, the Congo" but have enjoyed a much better fate than the latter (p. 31). Obviously, then, a causal analysis of Africa's international relations must seek other variables and move beyond what he calls "the oft-repeated but unfounded allegory of privation—that is, of an Africa chronically engulfed in chaos owing to inherent antagonism of opposing 'tribes' or the obsessive pursuit by domestic groups of their own selfinterest, unrestrained by state or civil institutions" (p. 41). Grovogui's timely thesis, therefore, is that, contrary to all appearances and misconceptions, the responses of African states to the varied domestic and external contingencies that they face are remarkably rational, and that the observable "tensions between state and civil society in relation to post-colonial governance" are indeed necessary, even if unfortunate (p. 41).

Clark advances the discussion of the purpose of state behavior in Africa by applying realist insights to the conflicts that have engulfed several African regions since the end of the Cold War. Using the notion of "regime security" as an analytical tool, he seeks to "understand why African state leaders have frequently intervened in one another's affairs, and why they have just as frequently refrained from doing so" (p. 94). His finding, which could easily have been predicted by the classical theorists of international relations, is at variance with those contemporary observers who attribute the behavior of African states simply to primordial instincts. According to Clark: "For the most part, African rulers understood that intervention in neighboring states would evoke counterintervention, usually through support of insurgencies. Thus the principled statements of mutual respect for the sovereignty and territorial integrity [of states] made in Addis Ababa in 1963 [by the Organization of African Unity] and ritualistically repeated thereafter reflected not only devotion to an ideal, but also the best insurance of regime security" (p. 97). What we see, then, are two sources of rationality of the African state: first, the self-interest of age-old realpolitik, and, second, the altruism of modern-day constructivism.

If we can now move beyond those seemingly omnipresent images of African exceptionalism and savagery, which were successfully reinforced by Robert Kaplan ("The Coming Anarchy," Atlantic Monthly [February, 1994]: 45-76), it is possible to see in this volume new opportunities for enriching international relations theory in several respects, such as Janis van der Westhuizen's examination of South Africa's marketing power as the other "Rainbow Nation" (aside from the United States) as a means of attracting tourists and foreign investors (Chapter 5); the problem of sanctioning "rogue states" (Chapter 9); the enigma of the Westphalian system (Chapter 10); the coalescence of "modernists" and "antimodernists" to protect the environment in southern Africa (Chapter 11); the impact of U.S. foreign policy on stability in southern Africa (Chapter 12); and the trend toward "new regionalism" in Africa as a response to security and developmental challenges (Chapter 13).

It is difficult for a diverse collection of essays, such as those contained in this volume, to measure up to the unenviable expectation of the editors to "replace the dominant... reading of the IR text" with another, obviously theirs. This volume does not come anywhere close to meeting that objective. What it does achieve, however, is raise a question that has been made even more important by the events of September 11, 2001, and that is whether the world is getting closer, as proponents of globalization would have us all believe, or growing farther apart, as "the clash of civilizations" thesis suggests. Either way, this volume is best seen as a call for a truly *international* theory of international relations and, for that reason, deserves the attention of scholars and practitioners alike.

As Michael O'Hanlon concludes in his excellent contribution to Rockets' Red Glare: "We should . . . get used to the debate over ballistic missile defenses. It has been around a long time, and no final resolution is imminent" (p. 132). In one sense, a review of these three recent books makes clear that many analysts had grown a bit too used to positioning themselves in terms of the 1972 ABM Treaty. Preoccupied with arguments over whether the treaty should be preserved, modified, or rewritten in light of a changing strategic and technological context, no one seemed to have anticipated that President George W. Bush would simply withdraw from it, invoking Article XV's provision that either party could withdraw if "extraordinary events related to the subject matter of this Treaty have jeopardized its supreme interests." Even many strategic defense supporters who deemed the treaty obsolete (as Robert Joseph persuasively maintains in his contribution to Rockets' Red Glare) generally believed that it should only—and would only—be scrapped if negotiations over U.S.proposed changes broke down. ("The Bush Administration," surmises O'Hanlon, "will surely try very hard to amend it before going to such an extreme") (p. 112). In the event, the president's team disavowed even the word "negotiation," saying they were willing only to "consult" the Russians regarding the treaty's impending demise.

While the sudden arrival of the post-ABM Treaty era, coupled with the new light thrown by 9/11 on the entire subject of homeland security, leaves all three of the books under review sounding slightly anachronistic, the central arguments advanced by the authors retain their relevance. The reason, as Roger Handberg notes in Ballistic Missile Defense and the Future of American Security, in summing up the historical record of four decades of debate over national missile defense (NMD), is "the fragile nature of any NMD deployment decision" (p. 182). After all, four previous American presidents committed themselves to some version of NMD (Lyndon Johnson to "Sentinel," Richard Nixon to "Safeguard," Ronald Reagan to the "Strategic Defense Initiative," and George H. W. Bush to "Global Protection Against Limited Strikes"), only to have some mixture of domestic and international politics, along with daunting technological hurdles, result in the decision's being reversed or deferred. For those who wish to acquire a detailed understanding of the domestic political obstacles confronting deployment, Handberg's book provides a detailed and insightful commentary. The missile defense lobby, he shows, has had to contend with more than just the community of dedicated opponents of NMD. Pursuit of deployment has repeatedly been stymied by a defense establishment wary of seeing funds diverted from existing missions, members of Congress who are similarly worried about the fiscal health of their cherished domestic policies, and a defense industry ambivalent about a program with such an uncertain future. Moreover, the slow pace of technological progress, combined with the opportunity provided by the budget process to revisit decisions annually, has until now provided ample time for economic downturns or diminishing external threats to take the steam out of efforts to deploy a defense.

Handberg divides the principle antagonists across four decades of debate over missile defense into "Wilsonians," who believe that deploying an NMD will increase the danger of war, and "believers," who are relentlessly committed to the pursuit of a U.S. national advantage. (His third group, the "pragmatists," will be discussed shortly.) These ideological perspectives, Handberg argues, drive the competing technical assessments that have attended a succession of prospective defensive systems. Those who believe in NMD for other reasons simply regard setbacks like test failures as temporary hurdles on the road to inevitable success (unless the "Wilsonians" successfully impede technical progress). Those who oppose defenses as fundamentally dangerous, by contrast, will predictably declare whatever technology is under consideration as either hopelessly flawed or easily overcome with cheap countermeasures.

Handberg characterizes both groups as under the sway of the same belief in a "technological imperative": Opponents "fear its success," even as supporters "push for that outcome." That observation is questionable. To the extent that opponents are motivated by a belief in a technological imperative, it is that the nuclear revolution, embodied in the offensive arsenals constructed by the Cold War superpowers (most dramatically in the form of long-range ballistic missiles), made defense in its traditional sense forever obsolete. NMD "believers," by contrast, assume that the offense-defense balance remains largely subject to human will. For those who have come to regard mutual assured destruction (MAD) as inescapable, episodic outbreaks of technological optimism about ballistic missile defenses must be countered by scathing critiques of prospective defensive technologies, coupled

to the more general admonition that security requires the regulation of armaments and the peaceful settlement of disputes.

That rationale for mutual "offense-only" deterrence animates a very large literature that dates back to the dawn of the missile age, to which The Phantom Defense is the latest substantial contribution. As in many such efforts to sway the attentive public, one encounters in this well-written book an occasional tension between assertions that defenses are bad because they are fundamentally unworkable, and, alternatively, that they are bad because they might seem effective enough to tempt a future American leader into launching war against another nuclear power. Each of those positions can slide into polemical overkill, as when we are told, without supporting documentation, that "an overwhelming majority of scientists and engineers who have considered national missile defense have deemed it a fantasy" (p. xviii). Or: "Since a national missile defense could never be tested in battlefield conditions, any shortcomings would not become apparent until it was too late" (p. 147).

That tendency to assert that defenses are both obviously unworkable and supremely dangerous is particularly unfortunate in a volume that also includes some strong, eloquently conveyed arguments against U.S. deployment of an NMD. Thus, Chapter 4 effectively depicts the great distance that the states now known as the "axis of evil" must travel before they can hope to deliver mass-destruction weapons to American territory via missiles, and Chapters 5 and 6 convincingly poke holes in some of the optimistic technical claims emanating from the strategic defense lobby (some of which they document as blatant misrepresentations). In short, the NMD lobby has probably both exaggerated the near-term missile threat from "rogue states" and greatly understated the technical challenge of coping with offensive countermeasures. The reader is left uninformed, however, of plausible responses to those concerns, just as the authors fail to address ways in which defensive deployments might not result in a world of arms racing, major power hostilities, and growing likelihood of nuclear war. While it is true, as James Wirtz notes in his introduction to Rockets' Red Glare, that "those involved in political advocacy feel no compulsion to explain the downside of their policies to their audience" (p. 6), it is also true that engaging serious counterarguments can ultimately be more persuasive than belittling or ignoring them.

The Phantom Defense was produced by the Washington-based Center for International Policy, which promotes a foreign policy "based on democracy, social justice and human rights" (p. 183). Their association of those hugely important goals with a fairly sweeping pacifism (as when they assert that "[d]iplomatic solutions to major problems will not be reached as long as the United States resorts to the military instrument," p. 155) is likely to have more limited appeal in the aftermath of 9/11. Of course, opposition to U.S. unilateralism in nuclear policy need not rely on such broader condemnations of the use of force, nor does a willingness to consider ballistic missile defense necessarily mean a wholesale rejection of nuclear arms control, let alone diplomacy in general.

Between the group Handberg labels "the believers" (who indeed sometimes seem to fit the bellicose stereotype depicted by the authors of *The Phantom Defense*) and the antidefense "Wilsonians," there is indeed an important, probably growing middle group. Handberg approvingly calls them the "pragmatists," that is, those who are always willing to "reweigh their choices in light of changing international circumstances and technology issues" (p. 157). This middle group, which holds the balance of power in domestic po-

litical battles over NMD, has been shifting toward support for deployment, Handberg notes, over the past five years. Accounting for that shift has been both increased concern over hostile states acquiring missiles of increasing range and a general belief that missile defense technology appears to be making significant advances.

The Wirtz and Larsen book, for the most part, is representative of that pragmatist camp. Most of the contributors endorse what is probably the mainstream view among experts: that while the Russians and Chinese can probably develop affordable and effective countermeasures to prospective U.S. ballistic missile defenses, the next several years may well bring us to the point that NMD deployment merits serious consideration. Astutely anticipating the general direction of policy, Wirtz and Jeffrey Larsen directed their contributors (noted experts drawn from universities, think tanks, and the government) to assume that the United States will deploy missile defenses, and to judge the consequences of three basic policy options: limited defense in a cooperative setting, enhanced defenses that might undercut cooperation, and unlimited defenses unconstrained by treaty. Although the contributors did not uniformly engage each scenario, the editors clearly succeeded in generating the sort of detailed inquiry that can help move the debate forward.

The first three chapters do a fair job of acquainting nonexpert readers with the origins and evolution of events bearing on the adoption and subsequent challenges to the ABM Treaty, followed by three chapters that look at the political, strategic, and arms-control implications of alternative defensive architectures. (As noted, the chapter by O'Hanlon stands out, although all are worth reading). The third and strongest section of the book deals with regional responses, with separate chapters devoted to China, Russia, South Asia, and U.S. allies. The China chapter, by Bradley Roberts, is particularly good, dramatizing both the intensity of China's desire to avoid coercion by the United States and the types of steps China can take to undercut any benefits from a unilateral move toward NMD (none worse than returning to its "old ways" of assisting other states in their programs of unconventional weapons and missile delivery systems). The inclusion of a chapter on South Asia, by Timothy D. Hoyt, is obviously timely, and it usefully lays out the contagion effects throughout the region should China counter U.S. defenses with a stepped up nuclear buildup. Those predisposed to embrace the Bush administration commitment to NMD should read this section carefully; they may well conclude, as Larsen points out in the conclusion, that the United States must go much further than it has to date in addressing the concerns of allies and potential adversaries (i.e., Russia and China).

Does that mean giving up on defense entirely? Perhaps the most intriguing aspect of Rockets' Red Glare is its evidence that the pragmatic center is beginning to contemplate a policy direction that transcends the sterile four-decades-old debate between the "believers" and the "Wilsonians." Several of the contributions, most strongly the one on Russia by Ivo H. Daalder and James M. Goldgeier, pay serious attention to the desirability of moving toward an arms-control regime that engineers a transition from today's nuclear world of total offense dominance to one of mutual defense emphasis. While the "road to a cooperative transition is long," they note, it is "in both countries' interest that they begin the journey" (p. 228). If 9/11 is to have a long-term impact on the debate over missile defense, one may hope that it strengthens prevailing views on the need for major power cooperation, even if it has also tragically demonstrated the need for homeland defense. Rockets' Red Glare helps prepare the groundwork for efforts to reconcile those objectives.

Global Limits: Immanuel Kant, International Relations, and a Critique of World Politics. By Mark F. N. Franke. Albany: State University of New York Press, 2001. 265p. \$59.50 cloth, \$19.95 paper.

David A. Welch, University of Toronto

It's not every day that you find a book that argues for its own irrelevance. This is not, of course, how Mark Franke characterizes his project in *Global Limits*—but it is the upshot, and he is admirably candid in putting together the individual pieces of the argument pointing to it.

Noting a recent upsurge in interest in Kant, Franke sets out to demonstrate that Kant does not, in fact, have "a theory" of international relations (IR), and that most modern scholars who invoke him either misunderstand or misappropriate him. Whatever Kant has to say about the subject, Franke insists, must be understood in the context of his broader philosophical project, and not merely with isolated reference to those few works to which IR scholars are usually attracted-most notably, "Perpetual Peace: A Philosophical Sketch" (1795). Franke stresses the critical nature of that larger project, but argues that "in engaging questions of international politics, Kant ultimately fails to meet his own standards of critique' (p. 195). At the end of the day, Kant is dogmatic and conservative: He takes the sovereign territorial state for granted; he mistakes parochial philosophical commitments for universal truths (particularly in his ethics, and especially in his conceptions of autonomy and moral personality); and he lacks the imagination to see that the parameters of international politics are constructed and constantly renegotiated. Franke suggests that if we were to take Kant seriously, pushing his critical project to its logical conclusion, we would embrace a radical critical position reminiscent of Richard Ashley and R. B. J. Walker. "In taking up a critique of world politics," Franke writes, "the only appropriate response to world politics is to always place the effects of worlding into doubt. The disciplinary guide for a critique of world politics could only be one that allowed the critic to place any claim to the world into doubt to begin with" (p. 192).

Thus, Franke maintains, Kant does not speak to modern IR theory; he cannot speak to modern IR theory; and, properly straightened out, he would refuse to speak to modern IR theory. As Franke puts it, "To consider in earnest Kantian theory and the debt that studies of international politics have to it is to ultimately deny the practicability of attention to international politics from the start" (p. 23).

If Franke is right, one might well ask: Why bother? As far as international relations is concerned, Kant is beside the point. And insofar as Kant has a point, international relations does not. There is simply nothing to say. The book is a performative contradiction.

Fortunately, Franke does not succeed in being irrelevant. Any scholar of international politics interested in Kant will want to reflect on what Franke has to say—for there is more than enough merit in some of the individual moves of his argument to warrant our close attention, and just enough error in his conclusions to save us from his skepticism.

Franke is quite right to insist that we put Kant's treatment of international politics in the broader context of his thought as a whole, and one of the book's great merits is the superb effort it makes to do so (drawing heavily not only upon the originals, but also upon an impressively thorough and thoughtful survey of important commentators). Franke is particularly interested in reading Kant's relatively short discussions of international relations in the light of the *Critique of Judgment*, and for this he makes an intriguing and provocative case in Chapter 3. Not everyone will find this compelling; I myself

find the Critique of Practical Reason and the Grounding for the Metaphysics of Morals more helpful. But disagreements of this kind fall well within the range of normal interpretive debate. Franke is also right to insist that Kant does not have a theory of international politics, if by the term we mean (as Franke usually does) a social scientific theory that we might test in the quest for valid empirical generalizations.

We are not obliged, however, to embrace Franke's curiously anachronistic stance on the relationship between Kant and modern IR scholarship. Franke wants us to reject a "democratic peace" reading of Kant on the ground that Kant did not subscribe to the ontology, epistemology, or methodology undergirding democratic peace research. Fair enough. Kant was no modern social scientist. But Franke also wants us to reject the very possibility of this kind of research because of what Kant ought to have said, in his view, on the subject of international politics. To this we are entitled to ask: Why should we? Can we not take inspiration from Kant without subscribing to his philosophical system as a whole, or to Franke's rereading thereof? Must we go All The Way With Immanuel K.?

More importantly, Franke has run wild with that part of Kant's critical project that requires us to question the presuppositions of our understanding of the world, and has neglected that aspect of it that was designed to enable us to know the world. Kant's main philosophical project was to reconcile faith and reason; it was not intended to demonstrate the impossibility of both. "[W]hile reason can never refuse to submit to criticism," Kant writes in the Critique of Pure Reason, "it does not always have cause to fear it" (A739/B767). Like Aristotle, Kant was aware that to say anything at all about the world, one has to take some aspects of it for granted. For Kant, these are phenomena, and he invites us to ask what we must believe about things-in-themselves in order to make sense of them. In contrast, Franke exhorts us merely always to question.

It is plain that Franke thinks this a worthwhile activity, and this is why he would deny my suggestion that his book is irrelevant by design. But his success in failing to be irrelevant does not lie here—for asking questions is pointless unless one believes in the possibility of answers.

The European Union in International Politics: Baptism by Fire. By Roy H. Ginsberg. Lanham, MD: Rowman and Littlefield, 2001. 256p. \$79.00 cloth, \$27.95 paper.

Carolyn Marie Dudek, Hofstra University

Since the Cold War, the United States as well as other countries have struggled with the "new world order." Further integration of the European Union, mostly in economic and political ways, has given it recognition as an actor within the international arena. During the crisis that followed the dissolution of Yugoslavia, the international community witnessed the EU's failure to bring a speedy end to the genocide and violence in the region. The EU's inability and lack of efficacy in the situation tarnished its image and prompted it to begin working toward the creation of a European Common Foreign and Defense Identity. More recent events of September 11, as well as increased violence between Israel and the Palestinians, once again beg the question: What is the role of an integrated Europe? As the United States takes on its war against terrorism, it looks to its closest allies in Europe to be supportive and to help in the endeavor. Actions or opinions from individual member states, however, seem to gain more public attention in the United States than those from the EU as a single entity acting in the global arena.

Roy Ginsberg's book sheds light on the seemingly elusive role of the EU in foreign policy. The author provides a rich qualitative empirical analysis of its role in international relations, with a close examination of the EU's part in Yugoslavia, the Israeli-Palestinian peace process, and the Union's influence upon the United States. What is truly unique and laudable about this study is the author's nonrealist perspective on the impact of EU foreign policy. At the outset of the book, he establishes that it is inappropriate to judge the EU with the same criteria as nation-states, rightly pointing out, "The EU and the nation-state are not governmental equals" (p. 5). In addition, Ginsberg does not claim to be assessing the failure or success of EU Common Foreign and Security Policy, but rather examining if the Union had an impact on global politics.

Ginsberg provides several examples of the EU's participation in or influencing upon international events, covering a broad range of world regions. Although this provides a fascinating litany, it lacks a logical ordering and ranking in importance. Perhaps this is less the fault of the author than due to the complexity and difficulty of the topic he is addressing.

To examine whether the EU has had an impact on international politics, Ginsberg constructs a conceptual model and evaluative structure that is then applied to the three specific cases mentioned above. The model focuses on the relationship between foreign policy inputs and outputs. He explains that EU outputs have created a feedback mechanism for the formulation and decision-making process of foreign policy.

The empirical portion of the book is rich, dense, and ambitious. The author covers the turmoil in the former Yugoslavia and the Middle East with attention to historical details. In the case of Yugoslavia, Ginsberg provides a nontraditional interpretation of the EU's role. Most discussions regarding the impact of the EU in the Yugoslavian crisis concern its failure to implement a successful foreign policy (e.g., cited in Ginsberg, Philip Gordon, "Europe's Uncommon Foreign Policy," *International Security* 11, no. 3 [Winter]: 27–74). Ginsberg, however, suggests that given the resources it had, the EU did have a significant impact. For instance, if we look at humanitarian aid efforts or the influence the EU had upon the new republics, it is clear that it did play a significant but often overlooked role.

Coverage of the EU's impact in the Middle East was an even clearer case study than that of the former Yugoslavia. Ginsberg's third case study deals with how the EU has influenced the United States. This chapter has less depth than the other case studies due to the breadth of the topic at hand. One minor criticism of the chapter is that no distinction is made between the EU's influence over U.S. domestic policy (e.g., the death penalty) and its influence over U.S. foreign policy, which seem to be very different issues.

At the conclusion of each chapter, the author provides an extensive table of each issue or input that was examined in each case study. He provides an impressive number of issues/inputs for each case study, and from this empirical research constructs his findings. Although Ginsberg provides many examples of EU involvement or lack thereof, he does not qualitatively distinguish the importance of one event over another. If the EU had a significant impact on a significant event, it should hold greater weight than its impact on a less important event.

Overall, this is a well-researched book of impressive quality. The theoretical framework is well thought out and appropriately addresses the role of the EU. I would highly recommend this book for its historical and empirical strength and its relevance to current world events. Roy Ginsberg has taken on a very important and complex issue in his book and he rises to the occasion.

Foreign Policy Decision-Making in Nigeria. By Ufot B. Inamete. Selinsgrove, PA: Susquehanna University Press, 2001. 313p. \$48.50.

Michael Anda, University of Arkansas at Little Rock

This elaborate study analyzes the Nigerian foreign policy decision-making structures and processes from 1960 (when Nigeria became an independent country) until 1999. Using Graham Allison's conceptual models of decision making (the rational-actor model, the organizational process model, and the bureaucratic politics model), Ufot Inamete examines how foreign policy decision making during the Balewa, Ironsi, Gowon, Muhammed/Obasanjo, Shagari, Buhari, Babangida, Shonekan, Abacha, Abubakar, and Obasanjo governments manifested both changes and continuities (p. 289). Importantly, theory from Allison's model is well integrated with the substantive and analytical portions of the book, and, thus, it goes beyond the theory of a strong-leader approach in Third World countries to demonstrate that developing countries do have organizational structures that deal with foreign policies.

From the Balewa to the Obasanjo government, foreign policy decision-making dynamics mostly reflected the rational-actor model. In the areas of the economic and cultural components of foreign policy, where the Federal Ministry of External Affairs had to work with other ministries and agencies, some tendencies of the bureaucratic politics model of foreign policy decision making often cropped up. However, this model was often superseded by the rationalactor model of decision making in the final phases of foreign policy. In the aspects of political, security, cultural, and economic components of foreign relations that dealt with routine and mundane activities, the foreign policy decision-making dynamics mostly reflected the organizational process model, since the ministries or agencies involved often simply followed the standard operating procedures of decision making used in such ministries or agencies (p. 292).

The foreign policy decision-making system in Nigeria is complex and Inamete's research shows that various organs, ministries, and agencies were involved in all its facets. This study shows that such federal ministries as those for external affairs, trade, and information are deeply involved in the shaping of the country's foreign relations (p. 289).

The external affairs ministry remained at the hub of decision making in terms of the political dimensions of the country's foreign policy. During the Balewa government, the office of the prime minister handled much of the foreign policy formulation rather than the Federal Ministry of External Affairs. The Supreme Military Council and the Supreme Military Headquarters managed a significant portion of the formulation activities that the Federal Ministry of External Affairs dealt with during the Muhammed/Obasanjo government. In the current Obasanjo government, the presidency is active in some foreign policy formulation (p. 290).

As this study shows, certain national leadership bodies played important roles as foreign policy decision-making coordinating structures. In cases of vital and sensitive foreign policy issues, the final decisions were made by these bodies: for example, the decision of Nigeria to recognize the Movement for the Popular Liberation of Angola (MPLA) government (during the Muhammed/Obasanjo government), the decision to nationalize the British Petroleum Company in Nigeria (during the Muhammed/Obasanjo government), the decision to boycott the 1986 Edinburgh Commonwealth of Nations Games (during the Babangida government), and the decision to lay the foundations for the formation of the African Petroleum Producers' Association (during the Babangida government).

Since the formation of the Economic Community of West African States (ECOWAS), the Federal Ministry of National Planning has had primary charge of Nigeria's relations with this regional body. Thus, this ministry is responsible for one of the most important foreign policy goals of Nigeria—the economic integration of the West African subregion, with the attendant increase in Nigeria's economic and, in recent times, military role in this subregion. The Federal Ministry of External Affairs plays a subsidiary role in terms of handling ECOWAS affairs. This means that the Federal Ministry of National Planning is primarily in charge of Nigeria's multilateral international relations in the West African subregion, with the Federal Ministry of External Affairs handling bilateral international relations.

State governments sometimes get involved in helping to shape the country's foreign relations, especially the leaders of states that share some of their borders with a foreign country. They assist the relevant federal organs, ministries, and agencies in managing or minimizing border conflicts and promoting economic and cultural contacts with bordering countries. Significantly, the cultural heritage that some of the border states share with neighboring countries also prompts them to promote cultural and economic links (p. 293). Yet, the author argues that Nigeria's repeated mediatory involvements in Chad have been dictated "by the imperatives of national security rather than any pan-African ideals" (p. 92).

From the Balewa to the Obasanjo government, the various components of foreign policy are shown to have manifested themselves differently. The Balewa government emphasized the political components. The Ironsi and later the Shonekan governments were very brief and also had very unstable domestic political systems. The Gowon government, during the civil war, gave much attention to the security components of foreign policy due to the need for arms to handle the conflict. After the war, attention was devoted to the economic components of foreign policy because that government led and championed the creation of ECOWAS and also because petroleum export revenues were increasing greatly. The Muhammed/Obasanjo government had a more assertive foreign policy profile and a stronger role in Africa—thus focusing more on the political components of foreign policy. During the Shagari government, all the salient components of foreign policy were handled in a mostly routine way since a nonassertive foreign policy posture was in

The Buhari government's strong stand on the problem of undocumented aliens from neighboring countries, its general determination to stop the smuggling of goods through its borders, and its desire to extradite former politicians to Nigeria to face corruption charges led to an emphasis on the security dimension of foreign policy. However, during the Babangida government, the economic facet was formally adopted as the primary focus of the country's foreign policy. Nigeria's very active, elaborate, and expansive role in Liberia and Sierra Leone, as well as in the United Nations peacekeeping missions in various parts of the world, meant that the security aspect of foreign policy was also very important during the Babangida government. The emphasis on economic and security facets of foreign policy continued during the Abacha, Abubakar, and Obasanjo governments.

The book is very detailed about the Muhammed/Obasanjo government. As noted earlier, the regime formally placed Africa as the centerpiece of Nigeria's foreign policy. Many succeeding governments have continued to see Africa in this way. Nigeria's foreign missions in Africa, in terms of both staffing and material resources, have been strengthened. The salient dimensions of Nigeria's foreign relations have focused on Africa. Despite Babangida's emphasis on the economic facet of foreign policy, Nigeria's economy took a turn for the worse during his era; the Nigerian economy (especially the currency) was greatly devalued during his regime. Was the international political economy largely to blame for this? This well-written book builds upon existing scholarship and is highly recommended.

The Global Covenant: Human Conduct in a World of States. By Robert Jackson. Oxford: Oxford University Press, 2000. 464p. \$29.25.

Cecelia Lynch, University of California, Irvine

Robert Jackson's recent book The Global Covenant is a work in the tradition of the international society school that extends the perspective of that school to today's world events and theoretical debates. Jackson's argument has several important components: that we live in a society of states that operates according to particular norms having significant ethical implications for the conduct of world politics; that this society of states can be distinguished from both the amoral perspective of the (neo)realists and the universalism of cosmopolitans; that this world must be examined primarily through the words and actions of statespeople, its primary articulators; that this world is distinguished by values of antipaternalism, normative pluralism, and the observance of sovereign rights of nonintervention and self-determination; and that recent crises (e.g., the Persian Gulf War, Bosnia, Kosovo, etc.) demonstrate more the continued durability of this world (which has existed roughly since Westphalia) than its decline or demise.

Taken together, the components of Jackson's thesis form a strong argument that draws on previous work, including primarily that of Hedley Bull, whose name is synonymous with the international society school, but also from Michael Oakeshott in theory and Terry Nardin in law. Jackson, however, employs the insights from these bodies of scholarship to develop his own thesis regarding the form, normative and ethical implications, and durability of the "global covenant." This thesis also draws on his own previous work on Africa. It is certainly a thesis that holds considerable power and therefore must be treated seriously. It is also a thesis that remains problematic, and Jackson's assessment of its critics is generally inadequate.

The global covenant, for Jackson, is both an empirical fact and something to be valued normatively. It is based on the concept of formal, de jure sovereignty in international law: that is, the notion that states respect each other's territorial integrity and political independence and thus refrain from any threat or use of force that violates another's sovereign boundaries. The global covenant, as such, also reduces "unnecessary political confrontation based on value conflict" (p. 182) over such issues as religion and ideology, and is therefore to be valued as contributing to international order and peace.

The concept of the global covenant is based, for Jackson, on understanding international politics as a human activity and a type of human relations. Focusing on the human and rejecting the idea that international relations are determined by mechanical forces distinguishes his conception (and the international society school in general) from many forms of realism, particularly neorealism. On the other hand, Jackson insists that his conceptualization of world politics differs significantly from other powerful conceptualizations articulated by critical theorists and constructivists. While his critiques of these bodies of theory are not very satisfying (for example, he often charges poststructuralists of various kinds with making "category mistakes," but does not sufficiently account for the

partiality of his own categories), he spends more time in differentiating his conceptualization from critical cosmopolitans such as Richard Falk. Here, Jackson employs the concept of the global covenant to take issue with the activism of contemporary humanitarian interventionists (among whom Falk is not easily placed). Jackson raises critical issues for debates about intervention, the export of democracy, and what is commonly called humanitarian action today.

Jackson argues that there is no basis in the global covenant for these types of intervention. For example, despite the existence of what he and others call "failed states," usually in Africa, that is, states that exist in name only but "cannot or will not safeguard minimal civil conditions for their populations" (p. 296), there is nothing that justifies intervention on the part of humanitarians or democracies to put things right. This is a powerful Kantian argument, one that many of those who disagree with Jackson on other grounds would strongly support. However, in making this argument, Jackson attempts to elide much of what actually goes on in world politics.

Jackson wants to focus on the "human," rather than the mechanical, and explicitly states that his liberal view of the global covenant precludes cosmopolitan universalism with regard to the type of values that should be practiced within states. Thus, he distinguishes between societas and universitas. The former is a juridical conceptualization of the relations between states, whereas the latter, for Jackson, is "sociological" and cannot, therefore, be addressed within the confines of the global covenant. While it is fine from this point of view (as well as many others) to criticize value-based universalism, Jackson does not sufficiently acknowledge that in promoting the global covenant as both empirical fact and worthy of normative support, he, too, is engaging in a type of universalism that can easily be questioned. Moreover, he does not escape from either ideological or sociological preconceptions. His conceptualization, while powerful and in many ways useful, promotes one layer of sociological understanding—that long promoted by diplomats and more recently by many international relations theorists—over others. It also reveals a worldview based, despite his own partial criticism of it, on what we might call colonial and/or paternalistic understandings of power politics. For example, the Persian Gulf War, which he justifies in a manner more thoughtful than most, can also be criticized from an international society perspective on paternalistic grounds.

It is interesting, moreover, that Jackson strongly adheres to a notion of security that limits it to the idea of individual and state "safety." While this is certainly an important aspect of security, adhering to it as the only definition that counts is a matter of contention, one easily challenged by both postcolonial and feminist theorists. How, for example, can we say that the threat of war looms larger for most people in sub-Saharan Africa than the threat of bodily harm from AIDS? Yet the latter is excluded from Jackson's limited conceptualization of security. In including the AIDS crisis or economic devastation in our understandings of security, one does not, as Jackson would have it, engage in "muddled thinking." Rather, to include such issues is merely to acknowledge that, as Jackson argues later in support of his conceptualization of the global covenant, people conceptualize the world differently and hold differing values and virtues preeminent. Following from this, the conception of security most important to some people in the First World or to (male) elites is surely not that which is critical for many others, including Third World women and/or those ravaged by AIDS, hunger, or environmental catastrophe. Jackson's antipaternalist stance, based on classical political philosophy, would do well to incorporate the critically important insights of contemporary feminist international relations scholarship in this regard, namely, that the global covenant is itself a gendered construction that benefits some and ignores or marginalizes others.

Such a recognition is necessary for any fully realized notion of value pluralism in our world. Jackson makes an important argument with many thoughtful implications for world politics today. But his central thesis still provides us with only one view of international politics, which is and will continue to be contested, both theoretically and substantively.

Peacemaking in Rwanda: The Dynamics of Failure. By Bruce D. Jones. Boulder, CO: Lynne Rienner, 2001. 200p. \$49.95.

Barbara F. Walter, University of California, San Diego

By almost all indicators, Rwanda's civil war should have ended in a successful negotiated settlement. Both the Tutsi rebels and the Rwandan government had agreed to participate in negotiations brokered by a team of Tanzanian mediators whom most people considered highly skilled. The two parties to the negotiations were able to reach and sign a detailed peace settlement that guaranteed both parties representation in the legislature and a set percentage of slots in the military. And the United Nations offered to "guarantee" the security of the two sides during the implementation period. Almost all factors purported to lead to a peaceful solution were present at the time the Arusha accords were signed in 1994. Rwanda's civil war, however, did not end peacefully. Instead, a peace process that seemingly had all the elements of success ended in one of the most rapid genocides in recorded history.

Bruce Jones attempts to explain this puzzle in his wellresearched book on the subject. Why did the Rwandan peace process fail despite the efforts of so many international and regional actors? And what can the international community learn from this failure? Existing explanations for the failed peace process and subsequent genocide tend to fall into two camps. Journalists have tended to view the posttreaty genocide as a continuation of the decades-long ethnic feud between the minority Tutsis, who had enjoyed a privileged position in society during German and Belgian colonial rule, and majority Hutus, who dominated government at the time of the peace in negotiations. The New York Times (Donatella Lorch, "UN in Rwanda Says It Is Powerless to Halt the Violence," 15 April 1994, sec. A3), for example, described the genocide as "centuries-old tribal hatred," while USA Today (Marilyn Greene, "Two U.S. Envoys Dispatched to Rwanda," 3 May 1994, sec. A5) portrayed the killings as "long-smoldering tribal hatred boiled over." Academics, on the other hand, have tended to place blame on a flawed peace process that gave key segments of the government few incentives to implement the deal (see Rene Lemarchand, Burundi: Ethnic Conflict and Genocide, 1994). Uneven treaty terms imposed on the Rwandan government by outside states not only gave Hutu elites few incentives to implement their side of the bargain, but also created a deeply disaffected but heavily armed minority group, the Akazu, with no stake in the successful implementation of the accords.

Jones, however, correctly points out that the Akazu's first victims were not Tutsis but politicians, journalists, and civil rights activists who supported a democratic transition, many of whom were Hutus. Ethnic hatreds and fear, therefore, cannot fully account for the outbreak of violence. Jones also argues against those explanations that place the blame solely on the terms of the Arusha accords that favored the Tutsi rebels. President Juvenal Habyarimana certainly faced considerable outside pressure to reform his government and negotiate with the rebels, but Jones points out that "at several points"

the external delegations, or observers, actually tried to limit the concessions made in Arusha," fearing that government concessions were too generous and could create a backlash

Instead, Jones convincingly argues that peacemaking in Rwanda failed due to a combination of four factors: the unwillingness of the Rwandese Patriotic Front (RPF) to offer the incumbent regime more attractive terms; the lack of a coherent and consistent plan on the part of regional and international actors to help implement the accords; the lack of a coherent strategy by outsiders to manage "spoiler" groups; and a lack of will by the major powers to become and remain involved once the genocide was under way. Most of the blame, therefore, is placed squarely on third-party peacemak-

To substantiate his argument, Jones offers a detailed account of the entire peacemaking process, and this is his greatest contribution to the growing literature on the Rwanda tragedy. Numerous accounts exist of the Rwandan genocide, but only Jones uncovers and recounts the details of the negotiations themselves. He begins with the opening set of peace talks, describing the delegations to the talks, the observers, and the mediator. He then moves through the issues discussed at each of the negotiations, the agenda, the timetable, and the key stumbling blocks on which the negotiations stalled. Scholars interested in conflict resolution and in understanding the causal process by which a conflict moves from war to peace will find no better descriptive account of a settlement process than Jones's account of the process held in Arusha.

What is the main lesson drawn? Rwanda, according to Jones, is not a tale that illustrates the need for early intervention by outside parties. Rather, it is a cautionary tale about the potentially disastrous consequences of peacemaking done poorly. In the case of Rwanda, peacemaking failed because those involved in the process, especially the United Nations, failed to understand that rebuilding a state in the aftermath of civil war requires a difficult choice. Either peace treaties must incorporate potential spoilers into any new government, or third parties must be willing to actively contain them. If spoilers are neither included nor contained, as was the case in Rwanda, disastrous consequences are likely.

Taken together, Jones's careful analysis of the peace process, his collection of information surrounding these negotiations, and his final conclusions will be a must-read for scholars interested in the dynamics of bargaining in war resolution, and for policymakers interested in designing more effective strategies for conflict management.

Money and Power in Europe: The Political Economy of European Monetary Cooperation. By Matthias Kaelberer. Albany: State University of New York Press, 2001. 254p. \$49.50.

Peter Henning Loedel, West Chester University

The puzzle of European monetary cooperation—namely, why sovereign nation-states would relinquish monetary autonomy in return for some measure of exchange rate stability—has produced a growing body of highly informed and theoretically strong works on European integration. Matthais Kaelberer's account fits nicely into this mold. The author argues convincingly that European monetary cooperation—especially Germany's leading contribution to the European Monetary Union (EMU)—is the result of a structural conflict of interest between weak and strong currency countries over the rules of monetary cooperation. In laying out his "structural" argument, Kaelberer's analysis, as he notes in his own words, "complements rather than substi-

tutes for other explanations of European monetary cooperation" (p. 6). In making this claim, his work will not settle the extremely lively theoretical debate on European integration, and European monetary cooperation more specifically. However, it is an important contribution to the literature and fills in some of the theoretical void involving concepts of "leadership" and "asymmetry" of power that help explain European integration.

Kaelberer's work is developed clearly and concisely and his analysis unfolds systematically. The author wastes no time in developing his thesis. He argues that the "relative bargaining power of both weak and strong currency countries has shaped an enduring patter of negotiations over the rules of exchange rate cooperation in Europe" (p. 1). Bluntly stated, strong currency countries—Germany in particular—bring to bear their structural power in the process of European monetary negotiations. Germany, for example, maintains influence over the bargaining agenda, is more successful in getting what it wants during negotiations, and strongly shapes the final outcomes of the negotiation. These conclusions are neither new nor surprising, but the framework that the author employs to account for Germany's structural power is illuminating and well worth the read. Furthermore, the argument highlights why, in particular, Germany would sacrifice some measure of monetary sovereignty in return for exchange rate stability (other works in this area include Karl Kaltenthaler's Germany and the Politics of Europe's Money, 1998).

What accounts for Germany's structural power? It is not, as many might suspect, the Bundesbank's authority in Germany and Europe (e.g., Dorothee Heisenberg, The Mark of the Bundesbank, 1999). Rather, Kaelberer focuses on two critical explanatory factors contributing to Germany's structural power. First, Germany's historically strong balance of payments position, which provides it greater freedom or "choice" (p. 2) in terms of macroeconomic adjustment, allows it opportunities that weak currency countries with negative balance of payment positions do not have. Second, Germany's leadership in providing a "standard setter" (p. 3) for monetary negotiations helped to focus the negotiations on a set of rules generally in line with German policy-based preferences. European monetary cooperation would ultimately be determined by the interplay of these two factors—Germany's bargaining leverage and German policy-based leadership.

Chapters 2 and 3 develop the core of Kaelberer's argument. The author is careful to fully operationalize and define his key concepts and variables. While these two chapters require some extra time to push through all the ins and outs of his analysis, his attention to detail and his own recognition of the strengths and weaknesses of his approach add to the credibility of his theoretical framework. He demonstrates a strong command of the minutiae of macroeconomic adjustment policies, balance of payments politics, and international cooperation. He is well versed in the literature on all of these subjects and provides adequate documentation and biblio-

graphic support for his arguments.

Chapter 2 lays out in great detail the "structural logic" of Germany's strong currency status and the bargaining advantage that such leverage provides in terms of negotiations. Bottom line: Germany maintained a strong ability to maintain macroeconomic autonomy and to externalize the costs of macroeconomic adjustment required to bring Europe's currencies closer together. Chapter 3 tackles the slippery notion of leadership. Germany's leadership, for example, is not resource based. In fact, Kaelberer is insistent that German leadership should not be analyzed in terms of hegemonic stability theory. Rather, Germany's leadership is policy based setting the focal point for European monetary negotiations on the basis of specific policies. Furthermore, the focal point would have to coincide with Germany's insistence that any cooperation not encroach upon domestic priorities.

The rest of the book is divided into four chapters that examine five major attempts to achieve greater bargaining exchange-rate cooperation. The cases include the Action Program of 1962 (Chapter 4), the Werner Report and the operation of the Snake (Chapter 5), the European Monetary System (Chapter 6), and the politics of European Monetary Union (Chapter 7). The chapters are uniformly well written and developed, and Kaelberer has a firm understanding of the historical details of each round of bargaining. Much of this material has been examined before, and those familiar with the cases will not find much new material here—other than in the notable way the author applies his theoretical framework. Moreover, while his contention that his work is the "first book" (p. 3) that analyzes the history of European monetary cooperation from the 1960s to the 1990s is a bit overstated (see Kenneth Dyson, Elusive Union: The Process of Economic and Monetary Union in Europe, 1994), the historical analyses do provide a convincing account of the ongoing patterns of European exchange-rate cooperation based on German structural power and Germany's policybased leadership. Most notable is Chapter 4's analysis of the Action Program, which sheds new light on the early efforts at European monetary cooperation.

The weakest link in Kaelberer's analysis is his concept of leadership. For example, he notes that Germany's leadership position "of monetary strength...derives largely from its balance-of-payments position. In other words, its monetary power is not so much resource based as policy based" (p. 56). Yet one could argue that the generally large German balance-of-payments surpluses are indeed resource based. This resource provided the Germans with the leverage (power) over their European partners. Is that not a form of hegemony? In short, Kaelberer's analysis of German leadership will not settle the debate over German hegemony in Europe. In fact, it may provoke some heated responses.

Finally, the implication of some of the analysis—most clearly set forth in Chapter 2 (pp. 22–26)—that Germany maintained great freedom or "choice" in terms of macroeconomic adjustment underestimates the powerful political constraints imposed on German policymakers. With such constraints coming from the Bundesbank, from domestic and partisan interests, and from European and global actors (the United States in particular), German government officials were constantly under pressure to make concessions on macroeconomic adjustment. While Kaelberer duly notes these concessions, his account only highlights the limits of German "choice."

These points should not distract from this important contribution to the ongoing debates on European integration and monetary cooperation. The book is highly recommended for all those interested in understanding the process of European integration and international relations theory more broadly. Most importantly, students and scholars of Germany's interests and power will find much to dissect and debate.

Modern Hatreds: The Symbolic Politics of Ethnic War. By Stuart J. Kaufman. Ithaca, NY: Cornell University Press, 2001. 262p. \$45.00 cloth, \$19.95 paper.

Chaim Kaufmann, Lehigh University

Stuart Kaufman's *Modern Hatreds* is a serious, original contribution on a highly policy relevant question, which is strengthened by his scrupulous case study design and deep regional expertise. Kaufman asks: when do intercommunal rivalries escalate to large-scale ethnic wars? His answer integrates a

number of existing strands of explanation around the central idea that myths, or as he calls them, ethnic symbols, are the root cause of ethnic violence. His core claim is that "people make political choices based on emotion and in response to symbols" (p. 29). Ethnic wars results from the lethal combination of two particularly noxious types of myths: myths justifying the political domination of specific territory, and myths of past atrocities by others that lead to widespread fears of genocide. The realities behind these myths are far less important than that they are pervasive "in each group's mainstream history texts written before the conflict began" (p. 30).

Thus, Kaufman draws on both of the existing mainstream approaches to explaining the proximate causes of ethnic wars—elite manipulation (mainly constructivist) models and structuralist (a.k.a. realist) explanations. Constructivist explanations operate top-down, explaining large-scale ethnic violence as a side effect of identity manipulation efforts by political entrepreneurs whose main goal is usually simply to retain power. The best example is V. P. Gagnon's "Ethnic Nationalism and International Conflict: The Case of Serbia" (International Security 19 [1994/95]: 130-66). Gagnon explains that in the late 1980s, Slobodan Milosevic and the Serbian Communist Party defused a growing crisis of regime legitimacy by wrapping themselves in Serbian nationalism, blaming all Serbia's problems on exploitation by other Yugoslav nationalities. This identity manipulation effort successfully preserved Milosevic's authority but at the same time set the conditions for the wars in Croatia, Bosnia, and eventually Kosovo.

Structuralist explanations, by contrast, operate bottom-up. As Barry Posen explains in "The Security Dilemma and Ethnic Conflict" (Survival 35 [spring 1993]: 27-47), neither particularly bad prior histories of intergroup hostility nor malicious manipulation by elites are either necessary or sufficient to cause serious ethnic violence. Whenever communal groups can no longer trust the state to protect them against possible intergroup violence, all groups must mobilize for self-defense. Often, however, the best measures for group defense necessarily also threaten others. The most common, recruitment of ethnically based militias and the hypernationalist rhetoric that often accompanies this—are easily observed by other groups and quite rightly perceived by them as threatening. This "security dilemma" is most severe when relatively low military-technical sophistication forces both sides to rely on mass armies, and when patterns of settlement of the rival groups are deeply intermixed, making it impossible for either side to define defensible enclaves without first engaging in offensive ethnic cleansing against others. Posen argues that the decline in central authority in Yugoslavia following Tito's death created conditions that led to the Croatian and Bosnian wars in exactly this way.

Kaufman's explanations operate both top-down or bottomup, sometimes focusing on prior mass attachment to dangerous symbolic beliefs, and sometimes on elite manipulation in the immediate prewar crisis. Although he recognizes absence of a central authority to suppress violence as an important enabling factor, he argues that intergroup security dilemmas are principally the results of symbolic myths and fears, not independent causes of escalation (see diagrams, p. 35). Thus, his main intellectual target is Posen. The main thrust of his six case studies—Nagorno-Karabakh, the Abkhazian and South Ossetian Wars in Georgia, the 1991-92 civil war in Moldova, and the Croatian and Macedonian secessions from Yugoslavia—is to show that in all six, the strength (or weakness) of symbolically generated hatreds and fears was sufficient to explain the outcomes but that structural conditions were neither necessary nor sufficient.

The case study work is excellent; well-organized, detailed. honest, and methodologically sophisticated. On three of the cases—Armenia, Moldova, and Georgia—Kaufman is himself one of the leading English-speaking scholars. The cases studied are a near universe of the southwestern fringe of the collapsing socialist camp in the late 1980s to early 1990s. Sticking to the period of socialist collapse strengthens the design, allowing Kaufman to hold more or less constant such possible perturbing variables as major cultural differences and prior institutional strength, avoiding the necessity to get into fullscale debates with authors like Samuel P. Huntington about "civilizations" or Jack Snyder and Karen Ballentine about democratization. Kaufman is careful to ensure the comparability of the sets of questions asked of each of the cases, and to focus on the theoretically important issues. In sum, he has set up a nice level playing field for two midlevel theories of ethnic war: his own symbolic politics theory versus structurally based security dilemma explanations.

However, one of the contenders—Kaufman's—remains essentially unfalsifiable because the core independent variable—ethnic symbols—is not well defined. Kaufman does not set operational limits on what sorts of beliefs or facts should qualify as the sorts of symbols that should be expected to cause ethnic conflict. For instance, in some instances, grievances that he calls symbolic actually appear to be quite real material grievances, such as ethnic preference in awarding better jobs. In other words, he establishes no clear analytic boundary between "symbol" and "structure," making it impossible to carry out crucial tests that could falsify his theory.

As a result, in the end Kaufman loses his own argument. Near the end of each case he quite rightly devotes a section to asking: "Could this war have been avoided? What would it have taken to prevent it?" If either symbolic politics or elite identity manipulation were behind the outbreak of a given war, then it should be possible to identify particular decisions by particular leaders that, if they had chosen differently, would have prevented escalation of the conflict. Of his six cases, Kaufman can credibly claim one and effectively surrenders two others, while three remain indeterminate. He is convincing that the war in Moldova was fully avoidable, although this was by far the smallest. In two other cases, he is compelled to admit that structural conditions made war unavoidable. The Nagorno-Karabakh war was driven by the insecurity of the isolated Armenian minority, which was so severe that no plausible level of reassurance could have satisfied them (pp. 76-78), while in the South Ossetian case, initially relatively mild chauvinist pressures, mainly from the Georgian side, were enough to set off an uncontrollable multiround spiral of escalating mutual fear and mutual mobilization (p. 125). The last three cases are indeterminate. Macedonia's secession was threatened by neither a security dilemma nor especially dangerous myths. The Abkhazian story is too complex to be called decisively in favor of either theory, while scholars have long contested the Yugoslav cases; Kaufman claims that war erupted only because key leaders intentionally started it in March 1991 (p. 191), but he provides no new evidence to sway the balance of the existing debate.

The greatest need now is for genuine crucial tests, of two types. First are cases in which anarchy, geography, and the other structural conditions pointed to by Posen were unusually bad, but in the absence of particularly bitter prior conflict history the supply of manipulable bad symbols was low. An example of a hard case for this condition would be the Arab-Israeli conflict, whose conflict history and associated myths were relatively mild before 1929 or even 1947. Second are cases with long conflict histories that provided ample supplies of bad myths, but where largely separated communities

faced only weak security dilemmas. A hard case of this type might be Cyprus since 1974, which has been tense but almost completely peaceful. Undoubtedly, several good Ph.D. dissertations will be built in part on Kaufman's book.

The Real and the Ideal: Essays on International Relations in Honor of Richard H. Ullman. Edited by Anthony Lake and David Ochmanek. Lanham, MD: Rowman and Littlefield, 2001. 320p. \$45.00.

Miriam Fendius Elman, Arizona State University

This collection of essays celebrates more than four decades of international relations research by the distinguished scholar and practitioner Richard H. Ullman. The book demonstrates the dilemma faced by the organizers of a Festschrift for a prolific author with wide-ranging interests: Should the chapters focus on, and collectively do justice to, one topic alone; or should the book take a wide-ranging approach that is more representative of the broad spectrum of subjects analyzed by the honoree? The editors of this volume have some success in following both routes simultaneously, albeit with some necessary trade-offs.

Written primarily by Ullman's former students at Princeton University who have gone on to make their own considerable contributions to the field, it is unsurprising that that the chapters are substantively rich and thoroughly researched. Most of the essays focus on the theme of human rights and intervention: Does international anarchy rule out the possibility for ethical behavior? What lessons are to be learned from recent U.S. policy in Kosovo and Somalia? How can the United States improve its track record in humanitarian intervention? This focus appropriately reflects Ullman's extensive writings on U.S. foreign policy in the Third World. Particularly noteworthy was a controversial article that challenged the Carter administration to bring down Idi Amin's regime by boycotting Ugandan coffee—even if doing so ultimately meant violating state sovereignty and GATT rules (Richard Ullman, "Human Rights and Economic Power: The United States versus Idi Amin," Foreign Affairs 56 [April 1978]: 529-42). Building on Ullman's work in this area, 9 of the volume's 13 chapters assess humanitarian intervention and, more generally, the use of force in defense of interests that go beyond traditional definitions of national security.

Following the editors' helpful overview of Ullman's work (Chapter 1), the first three chapters of the volume, in addition to Chapter 9, focus on the philosophical underpinnings of an intervention strategy. Each does a good job of demonstrating how a foreign policy resting on both the rule of law and the necessities of power might be constructed. For example, inspired by Ullman's insistence that the United States could do both "good (promoting values)" and "well (promoting interests)" in its foreign policy (p. 35), David C. Gompert convincingly argues (Chapter 2) that the way we think about intervention is slowly but surely moving into line with Ullman's insistence that intervention is required when foreign governments pass the "boundaries of decency" in their treatment of their own citizens (pp. 15, 45). According to Gompert, illegitimate regimes-states that have not secured the respect and allegiance of their people—can no longer bank on "shield[ing] barbarism" (p. 38) behind the principle of sovereignty, which "depends on lawfulness, not only in a state's behavior but also in the basis for its existence" (p. 39).

Michael W. Doyle's (Chapter 3) essay, which also examines the trade-offs between ethical and pragmatic considerations in international intervention, is a gem. Doyle argues that "international anarchy does not make ethical behavior impossible" (p. 52), but it does provide the "grounds for

cautious modesty" (p. 54) in the way that we practice it. As he correctly notes, humanitarian intervention involves making controversial judgment calls because it is plagued by both moral diversity and uncertainty: "It is hard enough to understand what is happening in Boston, New York, London, or Chicago; do we know what to approve or condemn in Eritrea?" (p. 54).

Chapters 4 to 8 offer assessments of recent U.S. efforts to apply power on behalf of humanitarian goals. I. M. (Mac) Destler (Chapter 5) presents new polling data suggesting that the American public supports "sensible" international engagements "to right grievous wrongs," provided that there is a reasonable likelihood of success (p. 87). Thomas G. Weiss (Chapter 6) shows how humanitarian values have influenced the definition of U.S. national interests in recent years. Eliminating ethnic cleansing, for example, is no longer considered a human rights policy that neglects national interests but a policy that is a vital interest (p. 102). Michael O'Hanlon (Chapter 7) revisits Kosovo and Rwanda and suggests steps that the United States and other NATO members might take to restructure their militaries in order to improve their capacity to prevent genocide. Finally, David Callahan (Chapter 8) offers a comprehensive analysis of the sources for ethnic violence in Kosovo in the 1990s and the belated U.S. military response.

The final four chapters in the volume move away from the focus on U.S. intervention abroad and examine the NATO alliance, U.S.-European relations, Germany's foreign policy in the 1990s, and the future of security competition in East Asia. The compromise between depth of analysis and breadth of coverage means that these four chapters sit somewhat uneasily with the earlier part of the book. That being said, since each of these essays is of such high quality, it would have been a pity to exclude them in the name of thematic integration. Ronald R. Krebs (Chapter 10) examines alliance politics, suggesting that rather than promoting cooperation and a collective identity, alliances such as NATO foster conflict among their members. Krebs does a superb job of critiquing the constructivist reading of alliances, but since his essay is also critical of the liberal perspective, it stands in stark contrast to the essays that proceed it. Additionally, while the earlier chapters are more concerned with U.S policymaking and the controversial empirical cases to hand, Krebs's chapter is given over to theory development. Similarly, the chapters by John S. Duffield, Thomas Banchoff, and David B. H. Denoon (Chapters 11 to 13) tease out the foreign policy predictions of alternative perspectives—realism, constructivism, and liberalism—at the cost of deflecting attention away from the volume's earlier guiding theme of human rights and intervention. In addition, Denoon's game theoretical approach to alignments in East Asia juxtaposes with the main methodological thrust of the volume.

The most striking lacuna in an otherwise excellent book is the authors' reticence to engage Leslie H. Gelb's commitment in the Foreword to elucidate Ullman's "commonsense" liberalism (p. ix). This is unfortunate because such a discussion would have dovetailed nicely with contemporary controversies in the international relations subfield. Despite the proliferation of liberal theorizing in recent years, there is still no consensus on how to delineate the research program's core elements. Some scholars contend that only arguments about state-society relations are liberal, and that claims about international institutions and ideas are best left to different programmatic areas (Andrew Moravcsik, "Taking Preferences Seriously: A Liberal Theory of International Politics," International Organization 51 [Autumn 1997]: 513-53). Reiterating and popularizing Ullman's understanding of liberalism would have provided an important opportunity to weigh in on the debate, and in particular the direction that liberal theory has taken.

Agency and Ethics: The Politics of Military Intervention. By Anthony F. Lang, Jr. Albany: State University of New York Press, 2001. 256p. \$65.50 cloth, \$21.95 paper.

Richard W. Mansbach, Iowa State University

Anthony F. Lang's Agency and Ethics is an effort to reinterpret international intervention from a normative perspective, normative in this instance referring to activities that construct identities and provide policy guidance. Although he describes himself as a "realist" (p. 3), Lang sets out to explain the outcome of military intervention in terms of the interaction between the normative dimension and the "political," which he defines as the competitive elements in a situation. He argues that states intervene in one another's affairs owing to what they believe are the norms that define their role(s) in international politics, and he shows how norms produce conflict as well as cooperation. In the cases that follow, Lang focuses on three norms—liberalism, colonialism, and humanitarianism: The first focuses on democracy, individual rights, and national self-determination; the second on responsibility for politically and economically less developed societies; and the third on assisting those in need. He ascribes the failure of intervention to normative disagreement among both friends and adversaries within and between participating countries, and he uses what Alexander George calls a "focused comparison" of cases to illustrate his claim.

Like increasing numbers of contemporary international relations scholars, Lang is reacting to what he believes is neorealism's distortion of the "classical" realism typically associated with E. H. Carr and Hans Morgenthau, in which facts and values remain intermingled. He also rejects the structural determinism that is closely associated with neorealism. Instead, Lang argues persuasively that state agency is dominant in international politics as viewed through the prism of intervention. In constructing his argument regarding norms, he makes use of those he refers to as "positive constructivists," "legal constructivists," and "ethicists" (p. 5). Lang's position regarding agency is based largely on his provocative reading of Hannah Arendt, especially her book (1958) The Human Condition. From Arendt, he derives his definition of politics and the relationship between action and self-definition. More importantly, Lang views Arendt's argument as more centrally normative than ontological.

Although Lang's tilt toward agency is desirable and defensible, the aggregation principle he uses to determine state agency is less so. Here he turns to Morgenthau for assistance, especially the contentious claim that the state as a collective actor only exists at times of military or diplomatic action. Since the cleavages and conflicts within states are every bit as common in those moments (as his cases make clear), Lang's argument is less convincing here. In contemporary international politics and eroding state sovereignty, it has become increasingly questionable whether or not there is a "national purpose" (p. 18) and, if so, whether or not any diplomat can represent it. In fairness, he does admit that his readers may conclude that he is a realist after all (p. 21). In addition, his debt to constructivism is unmistakable.

Following his riveting introductory chapter, Lang turns to three twentieth-century cases of failed military interventions—the American, British, and French incursions into Bolshevik Russia at the end of World War I; the British and French (and Israeli) occupation of the Suez Canal zone in 1956; and the United Nations and United States intervention in Somalia in 1992–93. All are fascinating cases,

but the selection criteria that the author uses are not entirely convincing. It is hard to see why the fact that they are from different time periods in the same century justifies their selection. In addition, it is hard to believe that military intervention has never achieved its objectives. It would assist the reader if the author shared with his readers the cases that were considered and rejected. And if there are any successful interventions, it might be more instructive to examine them and compare them to the failures (as Alexander George did in his *Coercive Diplomacy*, 1995) in order to determine which features were most crucial in determining failure.

In the relatively brief space available, the author does a good job in describing the cases he has selected, though little is added to what we already knew about them. Nevertheless, Lang's explanations of the outcomes of the cases are much more satisfying when the element of normative misunderstanding and collision, especially among allies and domestic agencies or political parties, are integrated in them. Power distribution alone hardly suffices to explain the failure in Russia in 1917 and 1918 or the rapid withdrawal from Somalia in 1993. And Lang's discussion of normative clashes among the French and British, as well as between them and the Americans, adds importantly to an understanding of how three allies brought about a disaster for the Western alliance. What the analyses also need, however, are discussions of why other explanations such as partisan and interagency conflict are not sufficient on their own.

Perhaps the major contribution of this book is its thoughtful and logical evaluation and explanation of why and how state norms, self-identities, and agency are critical to explaining the outcome of military intervention, with its implication for foreign policy more broadly. In particular, Lang's contention that gaps between normative visions are as great a source of conflict as gaps between narrowly defined interests makes this volume worth reading. One need not agree about the particulars to recognize the nature of this contribution in moving us away from sterile power-based explanations. I suspect that we shall see other analyses of this sort in the near future. In particular, I would hope to see follow-up efforts to refine Lang's work and to broaden it to other areas of international politics.

Alliance Politics, Kosovo, and NATO's War: Allied Force or Forced Allies? Edited by Pierre Martin and Mark R. Brawley. New York: Palgrave, 2001. 246p. \$49.95.

Anand Menon, European Research Institute, University of Birmingham, U.K.

The obvious advantage of edited collections, such as this interesting book, is that they allow a range of authors with a huge cumulative breath of knowledge about a subject to cover virtually all aspects of it. This they certainly do in *Alliance Politics, Kosovo, and NATO's War*, examining the way in which both NATO as a whole and its most important members reacted to and handled the Kosovo crisis of 2000.

What comes over most clearly from reading the collection is a paradox: The various NATO members reacted in different ways to the crisis in the Balkans, with stances ranging from unease in the case of Italy and the Czech Republic, to wholehearted support and "hawkishness" on the part of the British. Yet NATO remained relatively cohesive throughout, and the allies managed to carry out the air strikes and force Milosevic's exit from Kosovo without any serious fissures developing within the alliance.

A second major theme to emerge from the book is the oversimplicity of many accounts that view NATO either as a badly disguised form of American hegemony or as a European sleight of hand intended to tie the Americans to the Old Continent and to security threats that do not really concern them (see the chapter by Charles Kupchan). In reality, while acting under a variety of different pressures—both external and internal—neither were the various allies dragged into a conflict against their will by Washington, nor did they trap the Americans into a conflict in which they had no interest. A complex and subtle combination of perceptions of national interest, domestic pressures, and human rights concerns conspired to induce each state to participate in the NATO operation of its own free will.

Three of the chapters are particularly rewarding. Alan Henrikson provides a fascinating insight into the arguments surrounding the issue of the legitimacy of NATO's intervention in the Balkans—a subject often overlooked in the more politico-military accounts of the conflict that tend to predominate. Neil Macfarlane considers the challenges that exist to Euro-Atlantic security and argues provocatively that the very lack of these might represent a problem for Europe's security institutions. Underlining the paradoxes and uncertainty of the environment facing the allies (pp. 38-39) he concludes that "the absence of imminent "threats" may weaken the cohesion and diminish members' investment in Alliance structures. This will...draw into question its reputation and its associated dampening effect on potential...processes of conflict on the margins. In this respect, one of the more compelling challenges to European security may be the absence of compelling challenges to European security. The weakening of the Alliance, in turn, may produce the threats that the Alliance could be useful in addressing."

Finally, Louise Richardson provides a clear, analytical account of British policies toward the conflict. Rather than adopting—as, unfortunately, some of the contributors do—a purely descriptive, narrative approach, she sets forward a compelling explanation of why it was that the Blair government, or more precisely Tony Blair, put himself at the forefront of those desiring resolute military action in Kosovo. Comparing various competing explanations, she argues convincingly that one crucial element of any explanation must be quite simply that the British prime minster thought intervening was the right thing to do.

A problem inherent in putting together such a book is that of a lack of overall coherence and fidelity to the themes outlined by the editors. The volume fails to live up to its promise to make a contribution to theoretical debates about alliances. Stephen Walt's chapter is interesting, but it represents little more than a literature review. This would be fine if the theoretical issues he raises were addressed relatively systematically in the subsequent chapters. Yet fleeting references to constructivism and institutionalism take the place of a sustained debate concerning the theoretical implications of the crisis. Perhaps it is more an indictment of the state of the discipline than of the contributors themselves that even with such interesting stories to tell, they felt the need to make token genuflections toward theory. Be this as it may, the book would have been stronger had the theory either not figured at all or been dealt with more systematically throughout.

Finally, for a book that deals with NATO's first explicit involvement in an armed conflict, there was surprisingly little discussion of NATO itself. The chapter entitled "The Atlantic Alliance and the Kosovo Crisis" is in fact about NATO's newest and prospective members, rather than a discussion of NATO per se. What makes this particularly strange is the fact that in both Walt's chapter and thereafter, institutionalist approaches are mentioned as potential ways of explaining the development of the conflict. Yet the defining feature of

many institutionalist approaches is that they focus attention on the nature and functioning of institutions. In a book such as this, it would have been helpful to see a chapter devoted to asking and answering questions such as: Did NATO represent a dependent or independent variable during the conflict? To what extent did the NATO bureaucracy use the conflict as a means of self-legitimation (a point raised fleetingly in the introduction [p. 7, n. 3] but then ignored)? Did the Americans dominate decision making within NATO during the conflict? In this respect, more discussion of the spat between Generals Wesley Clark and Michael Jackson over whether to send troops to the Pristina airport would have been helpful.

This would have been a better collection had it addressed such issues. Yet it would be churlish to end on such a negative note. The book is an enjoyable and informed one that raises many of the major issues connected with NATO's first war. Anyone interested in the Kosovo conflict, and more particularly the West's reaction to the crisis, should certainly read it.

Foreign Policy and the Utopian Imagination. By Susan M. Matarese. Amherst: University of Massachusetts Press, 2001. 164p. \$28.95.

H. W. Brands, Texas A&M University

The last decade of the nineteenth century was a traumatic time for many Americans. The federal constitution was a hundred years old, and it no longer fit the nation so neatly as it once had. A new class of economic warlords, commonly called robber barons, made a mockery of some hallowed democratic principles; from behind the walls of their well-defended monopolies they laughed at notions that business should serve the public. "The public be damned!" jeered William Vanderbilt. Meanwhile, millions of immigrants flooded American shores; to many of the native born (or merely earlier arrived), the newcomers appeared an alien horde that would drive down wages, depress the standard of living, and change the character of America even as they were already changing its face. In the West, the frontier was disappearing—in fact, had already disappeared, in the statistical judgment of the director of the 1890 census—depriving the country of the demographic and psychic safety valve that had long bled off the worst of American discontent. As if all this were not enough, the 1890s witnessed the worst depression in American history to that point, closing hundreds of banks and factories and throwing hundreds of thousands of breadwinners out of work and onto the streets and highways.

One response to all this bad news, as Susan M. Matarese demonstrates, was an outpouring of utopian literature. A later generation would consider self-help a private project; the last generation of the nineteenth century adopted a communitarian approach, contending that personal happiness would follow a reorganization of the national life. Some of the road maps to redemption were stunning commercial and popular successes: Edward Bellamy's 1888 dream of a socialist paradise, Looking Backward, sold millions and spawned scores of Bellamy clubs devoted to promoting the peaceful revolution their author-founder described. Other works found smaller niches. Gustavus Pope's 1894 Journey to Mars posited the discovery of a red-planet civilization modeled on the best of American values (and some suboptimal ones as well; the Martians, like Americans since Francis Scott Key, struggled with the "Star-Spangled Banner").

Matarese has performed a valuable service in surveying the literature of the once-and-future America. She has tracked down titles long forgotten (understandably, in many cases)

and identified themes that ran through the genre. Introversionism was one: The utopianists argued that the answer to American woes lay within America itself, and paid little attention to the world beyond American shores. American uniqueness was a second theme: America had little to learn from the rest of the world. Related to American uniqueness was a third theme: an abiding sense of American moral superiority. Americans had the moral capacity to lift themselves above the rest of humanity, and in doing so to set an example for the rest of humanity.

It is when Matarese goes beyond her survey of the utopian literature to attempt a reconstruction of the worldview underpinning American foreign policy at the beginning of the twentieth century that she runs into trouble. Her taxonomy of American thinking on foreign policy is plausible enough. She identifies in her literature three conceptual models for an American role in the world: the United States as moral exemplar, as active crusader, and as benevolent superpower. But when she taxes the utopians for unrealism regarding the true state of the world and for believing that America was "somehow exempted from the ordinary relationships that burden and limit the choices of other nations" (p. 40), the reader is tempted to remind the author that these were, after all, *utopian* novels. The whole point was to ignore reality and create an alternate universe.

More problematic is Matarese's failure to identify a link between what the utopians wrote and what the policymakers did. To be sure, establishing connections of this sort is one of the most difficult tasks of any historian or political scientist. Matarese places her own work in the literature on national images, citing such other authors as Nathan Leites, Alexander George, and Michael Brecher. Yet although these scholars encounter similar problems, the best of their work demonstrates—through the writings and speeches of their subjects—that the policymakers subscribed to the national images the authors identify. In Matarese's case, there is scant effort to show that policymakers actually held the views proffered by the utopian writers. She argues that the utopian views were in the air and intimates that since policymakers breathed that air, they shared the views. Maybe they did. But it is worth remembering that for all the popularity of the utopian genre, most of its authors were considered crackpots. To claim a connection between the utopians and the policymakers is much like saying that American foreign policy today reflects the attitudes of the television series "X-Files." Doubtless there are "X-Files" fans in the State Department and perhaps even in the White House, but there are better explanations for the current condition of American foreign policy.

Matarese fills out her slim book with chapters on the sources of the American national image and on the possible relevance of the utopian literature of the 1890s for the post-Cold War era. On the whole, she provides a welcome overview of the work of some of the big thinkers of American history and diplomacy. Graduate students and nonspecialists will find her notes illuminating, and her appendix of utopian titles will cause many readers to wonder what in the world the authors were writing about, and perhaps to track down those titles themselves.

The International Politics of East Africa. By Robert Pinkney. Manchester: Manchester University Press, 2001. 242p. \$74.95 cloth, \$24.95 paper.

Claude Welch, State University of New York at Buffalo

Robert Pinkney, a respected British Africanist, takes on an ambitious task: examining the interaction of three Anglophone states (Kenya, Uganda, and Tanzania) with the international community since independence, but primarily since the end of the Cold War opened up new avenues for mutual influence.

I stress the adjective *mutual*, for Pinkney is careful in delineating how and with what degrees of latitude these countries have been able to deal with international financial institutions (IFIs), the European Union, the United States (to a far lesser extent than the EU), and others. As expressed on pages 2–3: "But the realities of power, or lack of it, meant that the room for manoeuvre of African states was severely constrained by the demands of Western governments, supranational bodies and global capital. . . . While African governments might have moved in the direction of economic and political liberalisation anyway, especially in view of the failure of the alternatives, Western pressure left them with little choice."

The International Politics of East Africa has its greatest value, in my estimation, in its portrayal of how the regimes of Presidents Daniel Arap Moi (Kenya), Yoweri Museveni (Uganda) and Ali Hassan Mwinyi (Tanzania) softened these external pressures with a variety of strategies. These ranged across a wide gamut of stalling, partial implementation, tactical concessions, and unfulfilled promises, discussed in detail in Chapters 6 to 8, each devoted to one of the three states.

In terms of organization, the book is divided into four sections. Part I takes on the difficult task of situating East Africa on the world stage during the past decade, a period of major transformation (the end of the Cold War and of apartheid) with immense significance for the region. Pinkney explores East Africa relative to the global political environment, the world of economic ideas, and interaction with Western governments and institutions. Part II, which constitutes the most interesting section, first explores state, society, and external influences, then examines the three states individually. Parts III and IV are relatively brief, examining the search for regional stability and integration, including the newborn East African Co-operation, and wrapping up.

According to Pinkney, East Africa's changing international environment is affected by three factors, none of which will surprise Africanists and readers of the APSR: globalization, the political and economic decline of Africa, and the ending of the Cold War. Each of these significantly reduced the leverage that Kenya, Uganda, and Tanzania enjoyed relative to external pressures and, conversely, significantly increased the leverage of the international (read, Western) community. However, the minuets of powers that were danced followed subtle choreographies of their own. All three governments had distinctive power bases, and each was important to the outside world in different ways. Although economic initiatives may have passed largely from African governments to Western governments and IFIs, they could dictate only within limits. Africa and the West are symbiotic based on resources of the former and order in the latter. In essence, the three East African states, like their counterparts elsewhere on the continent, are seeking marginal adjustments rather than fundamental

Perhaps the most ambitious part of *The International Politics of East Africa* involves state-society interactions. Pinkney contrasts two models (p. 93): the postindependence model, characterized by centralized government, bureaucratic domination, clientelism, military influence or domination, and material values in a collectivist setting; and the post-Cold War model characterized by governance, elements of new public management, external tutelage, increased armed insurgency, and entrepreneurship, self-help, and postmaterialism. The next 90 or so pages focus on the implications of the post-Cold War model. Obviously, drawing generalizations is hazardous, and the author is wise to concentrate on three

states (at least until postindependence dynamics drove them apart) that shared a common colonial master, a common currency and possessed rudiments of an economic community. However, the economic and political contexts of the three differed dramatically, as explored in Chapters 6 through 8.

Pinkney contrasts these five elements of change with five equally important elements of continuity: limited democracy beyond elections; survival of elites as a primary political goal; civil society with limited economic and political resources; ethnic conflict or threats of it; and continued and possibly increased dependence of both state and society on the West. Finally, in setting forth his model, he looks at changes (real or projected) and external attitudes. One of the most important is external aid being tied to retrenchment and increasingly to specific economic and administrative reforms.

What specifically has happened in the three states? For Tanzania, Pinkney concludes, "if the Western powers set the limits to what Tanzania could do, the nature of the Tanzanian state, society and political culture all helped to determine the extent to which it was feasible or expedient to follow policies which accorded broadly with Western wishes" (p. 138). Kenya experienced reluctant but significant transformation through external pressure. Uganda showed that, if a country sets its economy right, Western governments will not be unduly concerned with the extent of democratization or internal politics generally. But, in the last resort, he concludes, explanations of Western attitudes may hinge largely on the personalities of Presidents Moi and Museveni. There is less a crude trade-off between economic liberalization and maintenance of a noparty state than a series of adjustments. Since the end of the Cold War, there has been a significant change in the extent to which the West has deferred to African opinion and the extent to which African governments have felt it prudent or worthwhile to pursue policy objectives in different lands. There is far less willingness on the part of the West to intervene militarily. Its aid has been reduced. Well-documented creative tension has existed between the Western pressure for economic liberalization, democratization and more competent, accountable governments, and African governments' desire to attract aid and retain as much autonomy as possible as well as preserve their power bases. The International Politics of East Africa takes on a formidable task, and caries it out well.

Sanctions Beyond Borders: Multinational Corporations and U.S. Economic Statecraft. By Kenneth A. Rodman. Lanham, MD: Rowman & Littlefield Publishers, Inc., 2001. 288p. \$75.00 cloth, \$26.95 paper.

Scott Pegg, Indiana University-Purdue University Indianapolis

The 1990s saw a resurgence in demand for economic sanctions. The United States imposed extraterritorial sanctions on Cuba through the Helms-Burton Law and on Iran and Libya through the Iran-Libya Sanctions Act. Environmental and human rights activists also sought, albeit with limited success, to impose sanctions against the military regimes in Burma and Nigeria.

Kenneth Rodman's timely and provocative work Sanctions Beyond Borders tries to explain an interesting paradox here: Why, after the spectacular failure of the Reagan administration's 1982 attempt to impose extraterritorial sanctions on a pipeline project designed to bring natural gas from the Soviet Union to Western Europe, did such sanctions enjoy renewed popularity in the 1990s? The failure of the pipeline sanctions had, after all, "generated a scholarly and policy consensus that such measures do not work" (p. 231).

The academic consensus here is derived primarily from two different bodies of international relations theory. First, advocates of the growth of transnational relations or globalization argued that increasing economic interdependence and the globalization of production meant that multinational corporations were increasingly independent "stateless" actors who would no longer acquiesce to home-country government control of their business operations. Second, hegemonic decline theorists argued that the United States could no longer secure multilateral support for sanctions because its declining economic preponderance meant that its allies were increasingly unlikely to follow U.S. leadership here. Though coming at the issue from different vantage points, both perspectives agreed that the United States would be increasingly constrained in its use of sanctions.

Rodman tests these theories against evidence from the early days of the Cold War through to the late 1990s. His basic conclusion (pp. 14–16, 231, 237) is that the sanctions case-study evidence presents fundamental problems for both globalization and hegemonic decline theories and that U.S. domestic political variables offer more and better explanatory power than either of these theories.

The transnational relations or globalization literature is, for Rodman, correct that "economic interdependence renders extraterritorial sanctions both ineffective and costly" (p. 15). It grossly overstates, however, the independence of multinational corporations from their home-country governments in the area of economic sanctions. He points out that the foreign subsidiaries of U.S. corporations voluntarily complied with sanctions against Libya (pp. 109-14) and Iran (pp. 121-26), even though these sanctions did not include an extraterritorial component and hence technically did not apply to them. Domestic political variables similarly deterred corporations from challenging extraterritorial sanctions applied against Cuba (pp. 114-21). Rodman concludes that multinational corporations have been "more reluctant to use their global networks to escape home state sanctions regulations than they have been in relocating to minimize tax liabilities or shift production to more favorable business climates" (p. 15).

The hegemonic decline argument correlates well with the observable pattern of a decline in the use of sanctions by the U.S. government from the 1950s to the 1970s, yet Rodman argues that its explanatory power here is minimal. Hegemonic decline theorists ignore the fundamental reluctance of the United States to impose sanctions during the height of its hegemony in the 1950s, and they underestimate its continued ability to influence corporate behavior today, even though its share of world GNP is now much lower.

The relative decline in the use of sanctions in the 1970s and their resurgence in the 1990s can instead, Rodman argues, best be explained by changes in U.S. domestic politics (pp. 14–16). During the era of détente, domestic hostility to communism declined, enabling corporations to do business with socialist countries with less fear of political or consumer reprisals. The increased salience of social activists, ethnic lobbies, and a Congress less deferential to allied sensibilities than it was during the Cold War similarly offer better explanations for the return of sanctions in the 1990s.

The state centricity of Rodman's argument provides a necessary correction to the more exaggerated claims of transformation and state decline made by some globalization theorists. At times, however, he does perhaps downplay the role of nonstate actors more than he should. He argues that a fundamental difference between nongovernmental organizations (NGO) and states is that the former can only provide inducements for corporations to behave in certain ways whereas the latter can exercise commands (p. 223). While he is technically correct, evidence from large multinationals like

De Beers, Nike, and Shell clearly illustrates that NGO inducements are having substantive effects here. Beyond this, the shifts in domestic political sentiment, which carry much of the explanatory weight in his argument, indicate the possibilities for change and progress. Along these lines, Rodman emphasizes the importance of state policy changes in explaining the increased efficacy of sanctions against the apartheid South African regime in the late 1980s (p. 224). He is correct, but he minimizes the importance of activists and public opinion in prompting those state policy changes in the first place.

Rodman convincingly presents a standard liberal politicaleconomy argument against extraterritorial sanctions and the damage they cause, but he does not offer any alternatives to just doing business as usual with whatever human rights violator, tinpot dictator, or racist regime happens to be in power at the moment. The book ends by stating that "extraterritorial sanctions will pose credible risks to business ties between pariah states and any multinationals actively involved in the United States" (p. 244). Somehow, the implied alternative of pursuing only the lowest common denominator policies that multilateral consensus will support also seems less than satisfactory. One is reminded here of E. H. Carr's (1939) argument in *The Twenty Years' Crisis* that consistent realism breaks down because it fails to provide any ground for purposive or meaningful action.

That said, Sanctions Beyond Borders is arguably the single best introduction to the topic available today. It is comprehensively researched, theoretically sophisticated, rich in empirical detail, and well written. Aside from those scholars interested in sanctions specifically, the book should also appeal to those investigating domestic–international linkages, methodologists interested in testing theories against case studies, Cold War historians, and teachers of U.S. foreign policy looking for interesting case study material to integrate into their courses.

Manipulating the Market: Understanding Economic Sanctions, Institutional Change and the Political Unity of White Rhodesia. By David M. Rowe. Ann Arbor: University of Michigan Press, 2001. 256p. \$52.50.

A. Cooper Drury, University of Missouri

One of the big questions concerning economic sanctions is why they so often fail. A widely accepted answer to this question argues that economic sanctions increase the political solidarity within the target nation because the targeted public rallies behind its leader in the face of external pressure (Johann Galtung, "On the Effects of International Economic Sanctions, with Examples from the Case of Rhodesia," World Politics 19 [1967]: 378–416). David M. Rowe calls this explanation into question and shows that the unity behind the white regime in Rhodesia was politically constructed by the government and not a spontaneous rally effect generated by nationalism or racial unity.

In Manipulating the Market, Rowe modifies open market theory to increase the importance of the government's ability to influence how external economic shocks, such as economic sanctions, affect domestic actors in order to increase their political power. He argues that shocks (economic sanctions) create collective action problems for firms that are concerned with the distribution of the sanction's costs and benefits. For example, a sanction can cause a price war between exporting firms competing for the few remaining foreign buyers who are willing to bust the sanctions; such a price war could potentially destroy most or all of the domestic producers. As a consequence, firms have an incentive to request the government to solve these collective action problems through institutions

that control the domestic market and subsequently affect the nation's purchasing ability. Rowe shows that once the government has been given the power to manage these markets, it can control any opposition to its rule that might come from the domestic firms.

As evidence, Rowe analyzes the comprehensive economic sanctions led by Great Britain against Rhodesia. The sanctions were aimed at compelling Rhodesia to accept eventual majoritarian rule. Even though the sanctions had devastating effects on parts of the economy, Ian Smith's regime faced no organized opposition to its white rule policy and Universal Declaration of Independence. Rowe shows that this lack of opposition and therefore silent support for the regime was not a consequence of national or racial unity, but instead politically constructed by co-opting firms through 1) threats of retaliation, 2) new institutions that created a dependency on the government and conflicts of interest between the different businesses, and 3) disparity benefits for the different markets. Using case studies of the tobacco, commerce, and oil industries, Rowe shows how in these cases, the government used the markets for each good to control the different industries. In many instances, the evidence is based on source material only recently made available. Rowe uncovers a wealth of information about the British goals and impressions of the sanctions, including a threat of countersanctions from South Africa.

Of course, there are limitations to this study, as there are with all research. Most weighty is the question of generalizability. Rowe's theory of how economic sanctions affect the target's economy may hold to all levels of sanctions, but the incentives for governmental intervention in the market and subsequent government control of the markets probably apply only to comprehensive, or at least severe, economic sanctions. The argument asserts that a large disruption in the target's market leads firms to seek governmental intervention. However, if the sanctions do not have such a large impact on a given market, then no such incentive is created. Only the near cessation of inelastic goods to the target will lead to such an incentive. Thus, Rowe's argument holds primarily for cases such as Iraq and Yugoslavia, but less so for many cases such as the U.S. sanctions against Colombia for drug trafficking or against India and Pakistan for nuclear proliferation.

A second limitation in the study is the assumption that the target regime has the ability to manipulate the market. While a safe assumption in many cases, very weak governments may not be able to control the market to their benefit. Considering the number of weak states bordering on failure, the theory may be limited in scope. Additionally, many democracies do not have the authority to take the actions that the Smith regime took to protect itself, further narrowing the study's scope.

These limitations are far from acute. The study provides a very useful understanding of how economic sanctions affect a target, and how the target may react. In addition to better understanding of economic sanctions, Manipulating the Market also provides a good example of strong qualitative research. Although case studies of sanctions are not new to the literature, Rowe provides strong evidence for a theory that, while not completely generalizable, can be applied to many other sanction cases. Rowe also makes an excellent case for the importance of politics when considering economic outcomes. Consider the tobacco farmers giving their considerable political power to the government in hopes that they would be protected from the sanctions impact, only to have the regime use that power to destroy the farmer's market and political clout. Clearly, the power wielded by the regime is crucial to an understanding of both the economic and political outcomes of the sanctions.

Competing for Capital: Europe and North America in a Global Era. By Kenneth P. Thomas. Washington, DC: Georgetown University Press, 2000. 333p. \$65.00.

Alison M. S. Watson, University of St. Andrews

Much has been written over the years about the impact of increasing levels of capital mobility both on national governments and on the international economic system as a whole. Owners of capital can now "shop" among a variety of economies for the investment climate that suits their needs most—lower inflation, better interest rates, less restrictive labor policies, and so on. In this sense, the increase in capital mobility over the last few decades has meant that investors (particularly large investors) are no longer restricted to searching for investment opportunities in their domestic economy. Thus, domestic economic policy must increasingly accommodate the needs of the international marketplace.

Competing for Capital sets out to examine what, in the voluminous literature on capital mobility, has been a previously neglected area: the process of competition for investment. The aim of such an analysis, Kenneth P. Thomas argues, is to advise on ways in which the impact of such high levels of international capital mobility can be controlled. Overall, the text provides a detailed, and timely, examination of the market for investment.

The analysis begins with the assertion that government and corporate actors occupy an asymmetric position in the market for investment. Such asymmetry arises for a number of reasons. First, not only is capital highly mobile, but that mobility has also increased throughout the course of the last century, particularly in the period since World War II. Second, it is "generally easier for capital than governments to organize, and capital often need not even organize collectively" (p. 27). Finally, and importantly, firms have very good information about governments, but the information that governments have regarding firms is much less reliable. Such information asymmetry is particularly significant when governments are contemplating their bid for a specific investment project because they are unsure about when exactly the next investment opportunity will come along.

From this basic position, Competing for Capital introduces what the author terms the "rising-n-person prisoners" dilemma (RNPD) model of investment attraction in Chapter 2. This model anticipates that under situations of increasing capital mobility, governments will find it increasingly difficult to avoid the use of location subsidies to attract investment. Likewise, the increasing mobility of capital also suggests that the negotiating power of mobile investors will increase, compared to that of states. These are important points, but could have been made more accessible to the reader. In particular, although the North American automobile industry is put forward as a pertinent example, much more could have been made of different types of industry and different examples of this model in operation.

From here, the author describes, in turn, the way in which the European Union controls state aid (in Chapter 3), and how this state aid regime has been developed (Chapter 4). These two chapters provide in many ways the clearest analysis. Given the fact that European policymakers have long realized that offering a subsidy in one country can result in unemployment in others, policies for restraining state aid (such as tax breaks) to firms have been in place since the Treaty of Rome. Moreover, such policies of control are a significant element in EU competition policy as a whole, particularly since the inception of the Single European Act. What is particularly important here is the discussion of regional aid. As the author himself acknowledges, in a significant way the regulations that control regional aid are the pivotal element

in EU state-aid control because they identify the maximum amount of assistance that can be granted to a firm within the Union. Although some discussion is made here of enlargement and regional problems, it would have been interesting to see some discussion of possible future Central and Eastern European enlargement. This is particularly the case given the fact that there may be considerable regional difficulties involved in their accession, and also given that the EU has already seen major capital investments by firms in these areas.

From this discussion of Europe, Competing for Capital goes on to contrast EU state-aid policies with North American ones, noting that for North America there is "virtually no policy to address the competition for investment" (p. 148). Thomas argues that such a situation is indicative of the RNPD model, and of the number of levels of authority in the U.S. system in particular. In the latter, the actors include those at state level, as well as numerous county and municipal administrations, all of whom are involved in the process of attracting firm investment. Hence, for any specific investment project, increased capital mobility has also increased the number of suitable investment sites that are pursuing it.

After returning once more to the European case and specifically to the European Commission's role, the author argues that two theoretical conclusions in particular can be drawn. First, predictions regarding the likelihood of successful cooperation cannot simply be derived "from the potential availability of third-party enforcement of agreements, as one might surmise that federal North American governments are capable of providing" (p. 250). Second, efforts to control investment activity must be extensive. If they are not, states will avoid them by taking part in activities that have similar effects but are outside of the existing regulatory regime. From these conclusions arise a number of policy recommendations that Thomas puts forward well. First is that there should be a periodic collection of data on federal and subfederal subsidies. Second is that relocation subsidies should be banned. Finally, he argues for the efficacy of banning, ideally at the national level, local government use of investment incentives.

This book is an interesting one, is well researched, has some intriguing conclusions, and could indeed provide interesting policy recommendations in the face of increasing capital mobility. One major criticism, however, is that it is not as structured and well organized as it could have been. This detracts from the force of the arguments and could have been easily remedied in the editorial process. In addition, and perhaps related to the former point, it is not always evident who this book is most clearly aimed at. Nevertheless, for those readers willing to deal with a somewhat confused structure, Competing for Capital can provide original insights into the impact of international capital mobility on domestic policies and the competition for investment.

Gendering World Politics: Issues and Approaches in the Post-Cold War Era. By J. Ann Tickner. New York: Columbia University Press, 2001. 262p. \$45.00 cloth, \$17.50 paper.

Sandra Whitworth, York University

J. Ann Tickner's Gendering World Politics revisits—in the best sense of the term—many of the same themes she explored in her pathbreaking 1992 book, Gender in International Relations. The current volume comes almost a decade after that first book appeared—a decade during which both the field of international relations and the subfield of feminist IR have seen dramatic change and, especially in the case of the latter, exponential growth. Gendering World Politics

brings us up to date on the current state of debates within IR and provides a thoroughgoing and sophisticated introduction to what is now a very sizable feminist IR literature. Perhaps the most important contribution of this book, however, is that it allows Tickner to move forward an agenda she has been exploring for a number of years now, to encourage "conversations" between mainstream and feminist IR, and, in particular, to ask why authentic conversations, despite a decade of both turmoil and growth, have not been more forthcoming. As she writes in the Preface, "I have spent much of this time trying to understand why the intellectual gulf between different IR approaches is so wide and why conversations between proponents of these various approaches can be so difficult" (p. x).

Tickner's answer to that question provides the other theme around which much of the book is organized: With bases in very different metatheoretical traditions (one positivist and the other postpositivist), mainstream and feminist IR scholars construct knowledge differently. They pose different types of questions and they answer those questions in fundamentally different types of ways. While one focuses on how scientific a research methodology might be, the other raises concerns about inclusivity and the way in which the very posing of questions sets up boundaries for what counts as knowledge. Feminism's contribution to IR, Tickner points out, has been to ask different types of questions: "Listening to voices not previously recognized in the discipline has allowed IR feminists to see different worlds, ask new questions and begin to build the kind of practical knowledge necessary to construct more democratic theories and practices" (p. 147). Operating with such different premises makes conversations between traditional and feminist IR scholars, at best, difficult.

But not impossible. Judging from the way the book is organized—and in keeping with her desire to initiate conversations—Tickner's first intended audience is likely the IR student or scholar looking for an introduction to the feminist IR literature. She begins with an overview chapter of feminist theories, but the substantive part of the book comprises three chapters that review what she describes as some of the traditional topics in IR: "War, Peace, and Security," "The Global Economy," and "Democratization, the State and the Global Order." Within each, Tickner explores the way in which conventional sets of questions were posed around these themes, the challenges that emerged within IR from the 1970s onward, and the contributions that feminists have made to each of these sets of literatures.

By covering the "state of the field" around each of three issue areas, she grounds the discussion (and grounds it very comprehensively) within IR. Her review is a very good one, which is to be recommended to both newcomers and advanced students and scholars of IR. Having established the familiar ground, Tickner then moves to the varieties of feminist analysis that exist around each particular issue. This is where I was prepared to be disappointed—having staked her claim so clearly within IR, I fully expected that the feminist literature would receive short shrift or necessarily be presented in an overly simplified manner. But indeed, Tickner manages to convey both the breadth and the subtleties of feminist contributions in IR, and does so with a number of goals in mind: first, to show the extent to which there is enormous debate among feminists (it is to be hoped that having read this and other feminist work, no IR scholar can again talk about the feminist view as if there were only one); and second, to demonstrate the ways in which the feminist IR literature is sometimes similar to other critical approaches within IR, but also how the feminist literature is often quite unique. For example, and briefly, while many critics of mainstream IR have pointed to the ways in which the modern state can

no longer (if it ever did) provide security to its citizens, it is usually feminists who point to the ways in which prevailing norms of militarized citizenship, and militarized masculinity, contribute to many women's *insecurity*, whether or not those women's states are actually at peace or at war.

Much as Tickner hopes to establish more, and more extensive, conversations among traditional and feminist IR scholars, she does not water down what she sees as the ultimate implications for IR of feminist analyses. As she writes in her conclusion, "feminist perspectives on IR take us on paths that venture far from the conventional discipline" (p. 125). IR, as Tickner would have it, will not be the same if its more traditional practitioners take feminism seriously. Nor should

it be. It will focus on the "real world" issues of wartime rape, of trafficking, of the gender-biased impacts of structural adjustment policies, and of women's representation in international institutions, to name only a few, as much as it has previously focused on states, militaries, global finance, and international institutions. Tickner both begins and ends *Gendering World Politics* with a reminder that the formal field of IR was established by academics and practitioners who sought a more peaceful and just world. Continuing that important tradition will be possible, as Tickner notes, only by paying attention to feminist and other previously excluded voices, those who are drawing our attention to the real-world complexities of global politics in a new century.

**Democratic Autonomy** Public Reasoning about the **Ends of Policy** 

HENRY S. RICHARDSON

"This is a stunningly good book. Professor Richardson has enriched Democratic Autonomy with more concrete detail and a better-informed apprehension of how the modern administrative state actually functions, than one finds in most works of political philosophy. It is still philosophy, however, but in the best sense-a finely crafted rigorous argument about deliberation, freedom, and collective decision-procedures. As a result, it offers a more convincing vindication of the idea of popular self-government for modern society than any work of democratic theory published in recent years." **Navigating Public Opinion** Polls, Policy, and the Future of American Democracy

Edited by JEFF MANZA, FAY LOMAX COOK, and BENJAMIN I. PAGE

"The dynamic interplay of public opinion and political power takes center stage as an all-star case of academics shows how public opinion shapes and directs public policy in the United States. The impact of public mood on welfare, foreign policy, social security, and labor policy is tracked, explained, and evaluated to answer the question: 'When the people speak, do the politicians listen?"—Henry Brady, University of California, Berkeley 2002 392 pp.; 28 b/w line illus paper \$19.95 cloth \$65.00

Capitalists against Markets The Making of Labor Markets and Welfare States in the United States and Sweden

PETER A. SWENSON

"Capitalists against Markets is a magnificent follow-up on the author's much acclaimed Fair Shares. In this new book, Peter Swenson proposes a much needed correction to the mainstream-and myopic-focus on the role of labor movements in the making of welfare politics. It is both impressive and pathbreaking scholarship, and will no doubt provoke controversy. It certainly should as it forces us social scientists to take the politics of capitalists far more seriously than has been our want.'

JERRY GOLDMAN

Users of the *Bush v. Gore* CD-ROM can hear, read, and reflect on the entire Supreme Court proceedings surrounding the 2000 presidential election—from the initial petitions urging the Court's review through the briefs and reply briefs to the Court's opinions and dissents. The audio recordings demonstrate as no transcript can the tensions in the Court while it heard the arguments and questioned the attorneys. Goldman has taken full advantage of digital technology to allow access to the oral arguments as well as to the resulting decisions and dissents. It is the first in a series of compact discs on major decisions made by the U.S. Supreme Court.

LAURA R. WOLIVER

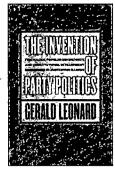

A vigorous analysis of the ways modern reproductive politics are shaped by long-standing debates on abortion and adoption, surrogacy arrangements, new technologies, medical surveillance, and the mapping of the human genome. As reproductive power finds its way into the hands of medical professionals, lobbyists, and policymakers, the geographies of pregnancy are shifting, and the boundaries need to be redrawn, argues Woliver.

#### **Romantics at War**

Glory and Guilt in the Age of Terrorism **George P. Fletcher** 

In this book, one of the country's most important legal thinkers brings much-needed clarity to debates about how to pursue war and justice in the age of terrorism. Here George Fletcher draws on his rare ability to combine insights from history, philosophy, literature, and law to place these debates in a rich cultural context.

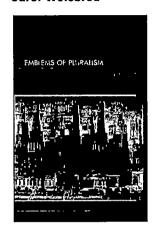

"George Fletcher has written a deep and engaging meditation on a simple fact: that we live in political collectives and rarely act with full autonomy. With a lawyer's gift for expounding his cases, he gives

us a wonderfully unlawyerly account, a philosophical investigation, of individual agency, responsibility, and guilt."—Michael Walzer, Institute for Advanced Study

"This is an impressive, at times magisterial, book. It provides an unusually sophisticated argument

#### **Veto Players**

How Political Institutions Work **George Tsebelis** 

Political scientists have long classified systems of government as parliamentary or presidential, two-party or multiparty, and so on. But such distinctions often fail to provide useful insights. *Veto Players* advances an important, new understanding of how governments are structured.

The real distinctions between political systems, contends George Tsebelis, are to be found in the extent to which they afford political actors veto power over policy choices. Drawing richly on game theory, he develops a scheme by which governments can be classified.

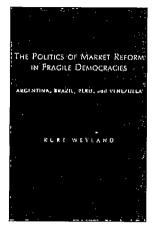

"Veto Players ranks as the most important theoretical argument to emerge in comparative politics over the last 10–15 years."  $\,$

# The Politics of Market Reform in Fragile Democracies

Argentina, Brazil, Peru, and Venezuela **Kurt Weyland** 

This book takes a powerful new approach to a question central to comparative politics and economics: Why do some leaders of fragile democracies attain political successculminating in reelection victorieswhen pursuing drastic, painful economic reforms while others see their political careers implode? Kurt Weyland argues that only with the robust cognitive-psychological insights of prospect theory can one fully account for the twists and turns of politics and economic policy in Argentina, Brazil, Peru, and Venezuela during the 1980s and 1990s.

"This is a truly original book.... The value of this book goes well beyond the countries and the policies it discusses—this is comparative political theory at its most fruitful."—Guillermo O'Donnell, University of Notre Dame

Frederic Jaher returns grand theory to historical scholarship by examining the Jewish encounter with state formation and Jewish acquisition of civic equality from the perspective of the "paradigm of liberal inclusiveness" as formulated by Alexis de Tocqueville and Louis Hartz.

Bruce I. Oppenheimer, editor

This collection includes the most recent scholarship on the U.S. Senate. Whereas most books simply assume that research about the House of Representatives holds equally well when applied to the Senate, this volume takes as its point of departure research about the Senate itself. This gives the reader a clear understanding of the particular nature of the institution and opens the door for further, refining research. Drawing on diverse methodologies, this book's synthesizing work will be essential reading for all scholars of American politics. The chapters are written by leading congressional scholars and cover topics including representation, elections, committees, party leadership, policy influence, and constitutional powers. \$64.95 cloth 0-8142-0915-7

Comparative Institutionalization David M. Olson and William E. Crowther, editors

The former Communist countries of Eastern Europe provide a treasure-trove of data on the development of democratic institutions. The contributors to this volume use the recent experiences of these countries to identify how the various committee systems are structured and tie the relative strength of the committee system in each country to the relative strength of its legislature. A uniform theoretical framework connects the work of each essay and ties the parts into an informative whole. \$59.95 cloth 0-8142-0912-2

#### **Outstanding Political Science References**

#### A Statistical History of the American Electorate

Voted a

Reference Source 2001" by

Ierrold G. Rusk

"exciting new compilation of U.S. electoral statistics. ... This is certain to be in demand.'

Library Journal (April 2002)

"Breaks the mold of electoral reference works"

--- Samuel Kernell

"An impressive research source"

- Gary King

"An enormously impressive contribution"

- Arend Lijphart

"An immense treasure of American electoral data"

— Helmut Norpoth

A Statistical History of the American Electorate adds a new, never explored dimension to the study of the nation's political system. Rusk has examined thousands of pieces of information and masses of historical and contemporary numerical data on elections to draw a new picture of our evolving voting ways and byways. His book adds immeasurably to the abundant literature about actual results and voting returns from specific elections by gathering data over time-200 years-and casting it into historical patterns. The material in each of his eight chapters is introduced with an essay that explains the data and its importance, and sets it all in context. Chapters include: Election Laws and Suffrage; Voting Participation; Presidential, House, Senate, and Gubernatorial Voting; and Measures of Voting Behavior.

#### THE DIFFERENCE WOMEN MAKE

The Policy Impact of Women in Congress
Michele L. Swers

"An excellent book on the policy impact that women have in the U.S. House that makes an important contribution with its multifaceted examination of legislative behavior. Most other work on women in legislatures is either descriptive and anecdotal or based on a systematic analysis of roll call voting. As Swers points out, relying on roll call votes as an indicator of behavior is incomplete and biased. Her systematic, rigorous examination of sponsorship, cosponsorship, amendments on the floor and in committee, and roll call voting provides a much more complete test of the impact of gender on policy making in the House than previous work, and the range of data she uses is excellent."

# PAPER COMPETITION

#### Institute of War and Peace Studies Columbia University

The Institute of War and Peace Studies of Columbia University offers three prizes of \$5000 each for the best papers developing practical ideas for dealing with problems of political violence, including civil and international wars, ethnic violence, genocide, and terrorism. The papers should be well grounded in a systematic, empirical analysis of the causes of political violence and should emphasize the practical prescriptions that follow from the analysis. They should be written in a way that makes them accessible to a wide audience.

Papers should advance proposals of a *general* nature for mitigating violent conflict. Specific conflicts may be discussed for illustrative purposes, but the principal goal is lasting knowledge that will be broadly applicable, not just proposals for solutions to a particular conflict. We strongly encourage applications from those who are at the early stages of their career, including graduate students, as well as established experts. The papers should not have been published as of the date of submission.

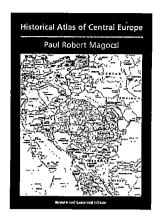

Papers should be article length (20-40 double-spaced pages) — we will not consider book-length manuscripts. No electronic submissions will be accepted. Winning papers will be selected by an interdisciplinary panel of distinguished academic and non-academic judges affiliated with a variety of institutions.

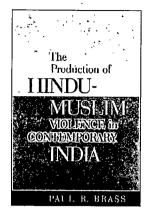

Papers must be submitted no later than March 1, 2003, to
